Sir Richard Luce said that he could not accept the amendment, and he remarked that on the Committee Sir Gerald Giffard, Colonel Elliot, and others who had had great experience of India were absolutely in accord with the findings. The opinions on which the Committee had founded its report were, indeed, based entirely on Indian experience. Medicine had already been for five years a "transferred subject." Was it likely that the Government could ever be persuaded to go back on this question? The decision to make medicine a "transferred subject" was, of course, in the Committee's view, a wrong one at the time; it should not have been transferred before the other services were transferred. But if India was ever to be "Indianized" medicine must be transferred some day.

Colonel Rait's amendment was lost.

Colonel O'Kinealy said that he was against Colonel Rait's proposal to allow the present state of affairs to continue until 1929, nor was he in sympathy with the Committee's recommendations. He thought the report had better be deferred until such time as it was known exactly what the Government of India proposed. Sir Richard Luce deprecated a deputation at the present moment, because he believed that it would be told only that the Secretary of State had no knowledge of the subject.

It was agreed eventually to take back the report and bring it up again at the March meeting of Council, and in the meantime, in view of the change which had taken place in the Secretaryship of State for India, consequent upon the change in the British Government, to send in again the resolution passed by the Council in July last, against the provincialization of the superior civil medical services, and request a reply.

#### *The New Building: An Australian Gift.*

Dr. Bolam, from the chair, moved that a special committee be formed to consider the arrangements to be made for the official opening of the new building. This was agreed to, and in addition to the officers and certain members of Council, it was agreed that Sir Humphry Rolleston, Sir John Bland-Sutton, Lord Dawson of Penn, Dame Louisa Aldrich-Blake, and Dr. Charles Buttar (President of the Metropolitan Counties Branch) should be asked to serve.

Dr. Bolam stated that he had a very pleasant circumstance to report in connexion with the furnishing of the building. The Medical Secretary had received a letter from Dr. Todd of Sydney, with regard to a proposal from the Australian Branches, in token of their kinship, to present the Association with something acceptable for the new house, such as a chair, rostrum, or table for the Council chamber, which should be made of Australian timber. On receipt of this letter a cablegram was sent to Australia saying that a President's chair for the Great Hall would be very acceptable. The Australian chair had thereupon cabled £100, with a request that the chair be made in this country, and that the High Commissioner for Australia (Sir Joseph Cook), and also Mr. Joseph Davis of Australia House, should be consulted with regard to material

and emblems. These gentlemen had very willingly responded and made suggestions.

The Council authorized a letter to be sent to Australia conveying its cordial thanks for this inspiring gift.

#### *"Birth Control."*

Dr. Fothergill brought forward the following motion:

That a group of registered medical practitioners be formed to consider and report to the Council whether the Association could usefully issue under its auspices a medical pronouncement to the profession and the public on the question of birth control; and if so, how and in what manner it is recommended that steps should be taken in order to prepare and issue such a pronouncement.

Dr. Fothergill reminded the Council that "birth control" was a subject upon which the public was expecting, and rightly, guidance from the medical profession. At present an enormous amount of harm was being done by unauthorised and uneducated propaganda. The question was being wasted hither and thither by the caprice of public opinion. The medical profession itself wanted educating. What was needed was research to establish the facts of the case, the inferences to be drawn from the facts, and the information which was to be based upon them. It was a necessary subject of inquiry how conception control was operating at present on the married woman, on the child, and on the nation. It was necessary to find out in what sections of the community this practice was mostly going on, with what frequency, and with what results; further, was "spacing" of families desirable, and should it be confined to cases of organic disorder, psychic disorder, and permanent obstetric difficulty? Again, did a fall in birth rate necessarily mean a less efficient race? He urged the Council to take steps to find out whether a useful pronouncement could be made on this question. He had begun by thinking that it was an ethical question simply, but he had come to the conclusion that it was almost entirely a psychological one. If his motion were carried he had a second motion setting out the names of fifteen medical men and women, including four members of the Council, who might form the proposed group.

Mr. Turner, in the place of Dr. Wallace Henry, who had had to leave the meeting, seconded the motion. He believed that there was a definite need for guidance from the Association.

Dr. Hawthorne moved as an amendment:

That as it is within the duty and competence of the Council to advise the Representative Body on the policy of the Association, the Council does not consider it necessary to solicit extramural advice on the definition of an official announcement on the subject of birth control, seeing that the Council had formed no conclusion that such an announcement would be advisable.

He considered that this motion was an invitation to members of the Council to avoid a responsibility which was placed upon them by the terms of the constitution. It was the duty of the Council to initiate policy and commend it to the Representative Body; but, instead of the proper machinery provided by the constitution, Dr. Fothergill proposed to set up some external organization consisting of fifteen selected practitioners. It might be a proper course for the Council to appoint a committee and to bring in experts, but that was not the proposal now before the Council. The proposal was to set up a specially appointed *ad hoc* body, not to inform the Council how a particular policy was to be carried out, but first of all to determine whether the Association should have a policy on the subject at all. He submitted that it was an improper thing to suggest that, before the Council had determined its policy, this extramural organization, which the Council could not possibly control, should be set up in the way Dr. Fothergill proposed. Looking at the names of members of the proposed group, he estimated that at least eight out of the fifteen were already more or less openly advocates of the practice of "birth control." Certain of them were not even members of the Association. He considered that the competence of the Council was challenged by this proposal.

Dr. Fothergill said that if any constitutional objection was raised he was quite ready to substitute for the proposed group a special committee of the Council, of which, of course, the officers would be members.

The Chairman suggested to Dr. Fothergill that, in view of the lateness of the hour and the diminished number of members remaining, it might be well if consideration of his motion were adjourned to the next meeting of the Council on March 25th, when he would promise to give it an early place on the agenda.

Dr. Fothergill signified his assent, and this course was agreed to.

This concluded the business before the Council, which had occupied seven hours.

# British Medical Association.

## NINETY-THIRD ANNUAL MEETING, BATH, JULY 21st to 24th, 1925.

Patron: HIS MAJESTY THE KING.

President: J. BASIL HALL, M.Chir.Cantab., Consulting Surgeon, Royal Infirmary, Bradford.

President-Elect: FREDERICK GEORGE THOMSON, M.A., M.D., M.R.C.P., Physician, Royal United Hospital, Bath.

Chairman of Representative Body: HENRY BRITTEN BRACKENBURY, M.R.C.S., L.R.C.P.

Chairman of Council: ROBERT ALFRED BOLAM, M.D., LL.D., F.R.C.P.

Treasurer: N. BISHOP HARMAN, M.A., M.B., F.R.C.S.

### PROVISIONAL PROGRAMME.

BATH ABBEY.

**T**HE incoming President will deliver his address to the Association on Tuesday, July 21st.

THE ANNUAL REPRESENTATIVE MEETING will begin on Friday, July 17th, at 10 a.m., and be continued on the three following week-days.

The statutory ANNUAL GENERAL MEETING will be held on July 21st at 2 p.m., and the adjourned general meeting at 7.45 p.m.

The Annual Dinner of the Association will take place on Thursday, July 23rd.

The Conference of Secretaries will be held at 2.30 p.m. on Wednesday,

July 22nd, and the Secretaries' Dinner at 6.30 the same evening.

The Annual Exhibition of surgical appliances, foods, drugs, and books will be opened by the President-Elect on July 21st at 9.30 p.m., and will remain open on July 22nd, 23rd, and 24th.

A Popular Lecture will be delivered by Sir W. H. Bragg, K.B.E., F.R.S., on Friday, July 24th, at 8 p.m.

Saturday, July 25th, will be given up to excursions to places of interest in the neighbourhood.

A provisional time-table of the principal events appears on page 92.

### THE SECTIONS.

The Scientific Sections will meet from 10 a.m. to 1 p.m. for papers and discussions, and it is hoped that laboratory and clinical demonstrations will be arranged for the afternoons of July 22nd, 23rd, and 24th.

The following Sections will meet on Three Days—Wednesday, Thursday, and Friday, July 22, 23, and 24.

#### MEDICINE.

President: The Right Hon. Lord DAWSON OF PENN, G.C.V.O., K.C.M.G., C.B., M.D., F.R.C.P. (London).

Vice-Presidents: E. J. CAVE, M.D., F.R.C.P. (Bath); T. R. ELLIOTT, D.S.O., C.B.E., M.D., F.R.C.P., F.R.S. (London); Professor J. A. NIXON, C.M.G., M.D., F.R.C.P. (Bristol); Professor ADAM PATRICK, M.D., M.R.C.P. (Dundee); W. N. WEST WATSON, M.D. (Bradford).

Honorary Secretaries: F. G. CHANDLER, M.D., M.R.C.P., 1, Park Square West, Portland Place, London, N.W.1; JAMES LINDSAY, M.D., M.R.C.P., 1, The Circus, Bath.

#### SURGERY.

President: Sir BERKELEY MOYNIHAN, Bt., K.C.M.G., C.B., M.S., LL.D., F.R.C.S. (Leeds).

Vice-Presidents: A. H. BURGESS, M.B., F.R.C.S. (Manchester); FREDERICK LACE, F.R.C.S. (Bath); H. S. SOUTAR, C.B.E., M.Ch., F.R.C.S. (London); C. F. WALTERS, F.R.C.S. (Bristol).

Honorary Secretaries: A. DE V. BLATHWAY, M.R.C.S., L.R.C.P., 6, Brock Street, Bath; A. L. FULLER, F.R.C.S., 9, Gay Street, Bath; R. M. VICK, O.B.E., M.Chir., F.R.C.S., 152, Harley Street, London, W.1.

#### OBSTETRICS AND GYNAECOLOGY.

President: Lady BARRETT, C.B.E., M.D., M.S. (London).

Vice-Presidents: H. S. DAVIDSON, O.B.E., M.B., F.R.C.S. (Edinburgh); EARDLEY L. HOLLAND, M.D., F.R.C.P., F.R.C.S. (London); W. F. RAWSON, F.R.C.S. (Bradford); D. C. KAYNER, F.R.C.S. (Bristol).

Honorary Secretaries: J. BRIGHT BANISTER, M.D., M.R.C.P., 19, Harley Street, London, W.1; W. H. DUNCAN, F.R.C.S. (Bristol), 33, Gay Street, Bath.

#### PATHOLOGY AND BACTERIOLOGY.

President: Professor J. C. G. LEDINGHAM, C.M.G., D.Sc., M.B., F.R.C.P., F.R.S. (London).

Vice-Presidents: J. A. BRANTON HICKS, M.D., M.R.C.P. (London); Professor E. H. KETTLER, M.D. (Cardiff); RUPERT WATERHOUSE, M.D., M.R.C.P. (Bath).

Honorary Secretaries: Lieut.-Colonel JAMES COWAN, M.B., R.A.M.C. (ret.), 44, Combe Park, Bath; C. C. OKELL, M.B., M.R.C.P., Wellcome Physiological Research Laboratories, Langley Court, Beckenham, Kent.

#### NEUROLOGY AND PSYCHOLOGICAL MEDICINE.

President: Sir MAURICE CROMBIE, M.D., F.R.C.S. (London).

Vice-Presidents: EDWIN B. ARTHUR, F. HURST, M.D., M.D. (Bath); S. A. K. WILSON, M.D., F.R.C.P. (London).

Honorary Secretaries: RAY EDWARDS, M.R.C.S., L.R.C.P., 29, Gay Street, Bath; EDWARD MAPOTHER, M.D., M.R.C.P., Maudsley Hospital, Denmark Hill, London, S.E.5.

#### THERAPEUTICS (INCLUDING BALNEOLOGY AND RADIO-THERAPY).

President: Professor R. B. WILD, M.D., F.R.C.P. (Chinley, Derbyshire).

Vice-Presidents: PRESTON KING, M.D. (Bath); W. MITCHELL, M.B., C.M. (Bradford); NATHAN MITCHELL, M.D., F.R.C.P. (London).

Honorary Secretaries: DOROTHY C. HARE, C.B.E., M.D., M.R.C.P., 1, Bickenhall Mansions, London, W.1; CECIL H. TERRY, M.B., 15, The Circus, Bath.

#### LARYNGOLOGY, OTOTOLOGY, AND RHINOLOGY.

President: ARTHUR H. CHEATLE, C.B.E., F.R.C.S. (London).

Vice-Presidents: NEIL MACLAY, M.B. (Newcastle-upon-Tyne); IRWIN MOORE, M.B., C.M. (London); SYDNEY R. SCOTT, M.S., F.R.C.S. (London).

Honorary Secretaries: H. N. BARNETT, F.R.C.S. (London), 27, The Circus, Bath; R. SCOTT STEVENSON, M.D., 30, New Cavendish Street, London, W.1.

The following Sections will meet on Two Days.

#### DISEASES OF CHILDREN.

President: ROBERT HUTCHISON, M.D., F.R.C.P. (London).

Vice-Presidents: CAREY F. COOMBS, M.D., F.R.C.P. (Bristol); P. T. CRYNELL, F.R.C.S. (Belfast); CHARLES MCNEIL, M.D., F.R.C.P. (Edinburgh); REGINALD H. MILLER, M.D., F.R.C.P. (London).

Honorary Secretaries: VINCENT COATES, M.C., M.D., 10, The Circus, Bath; R. A. RAMSAY, M.Ch., F.R.C.S., 123, Gloucester Terrace, Hyde Park, London, W.2.

#### OPHTHALMOLOGY.

President: W. MARDON BEAUMONT, M.R.C.S. (Bath).

Vice-Presidents: R. WALLACE HENRY, M.D. (Leicester); A. W. ORMOND, C.B.E., F.R.C.S. (London); C. H. WALKER, F.R.C.S. (Bristol).

Honorary Secretaries: R. COLLEY, M.B., D.O.M.S., 30, The Circus, Bath; P. G. DOYNE, M.B., F.R.C.S., 8, Harley Street, London, W.1.

#### ORTHOPAEDICS.

(One day being combined with Surgery.)

President: Professor E. W. HEY GROVES, M.S., F.R.C.S. (Bristol).

Vice-Presidents: NAUGHTON DUNN, M.B., Ch.B. (Birmingham); G. R. GARDLESTONE, M.B., F.R.C.S. (Oxford); E. MUIRHEAD LITTLE, F.R.C.S. (London).

Honorary Secretaries: T. TWISTINGTON HIGGINS, O.B.E., F.R.C.S., 27, Harley Street, London, W.1; J. S. LEVIS, M.C., M.B., 20, Gay Street, Bath.

## PUBLIC MEDICINE.

President: T. EUSTACE HILL, O.B.E., M.B., D.Hy. (Durham).  
 Vice-Presidents: T. W. NAYLOR BARLOW, O.B.E., M.R.C.S.,  
 L.R.C.P. (Wallasey); J. F. BLACKETT, M.D. (Bath); W. A. BREND,  
 M.D. (London); S. NOY SCOTT, M.R.C.S., L.R.C.P. (Plymouth).  
 Honorary Secretaries: A. NEVILLE COX, M.D., M.R.C.P., 21, Corn-  
 wall Gardens, Preston Park, Brighton; R. E. THOMAS, M.D.,  
 11, Darlington Place, Bath.

The following Section will meet on One Day.

## MEDICAL SOCIOLOGY.

President: CHARLES E. S. FLEMING, M.R.C.S., L.R.C.P.  
 (Bradford-on-Avon).  
 Vice-Presidents: J. W. BONE, M.B., C.M. (Luton); WILFRED  
 BUCKLEY, C.B.E. (London); G. P. MALE, M.R.C.V.S. (Reading);  
 E. A. STARLING, M.B., M.Ch. (Tunbridge Wells).  
 Honorary Secretaries: C. J. BUCHAN, M.B., 326, Brownhill Road,  
 Catford, London, S.E.6; C. A. MARSH, M.D., The Roseries, English-  
 combe, Bath.

## PROVISIONAL TIME-TABLE.

## FRIDAY, JULY 17TH.

10.0 a.m.—Representative Meeting.  
 7.15 p.m.—Representative Dinner.

## SATURDAY, JULY 18TH.

9.30 a.m.—Representative Meeting.  
 8.0 p.m.—Smoking Concert.

## SUNDAY, JULY 19TH.

10.0 a.m.—Excursion to Cheddar, Glastonbury, and Wells.

## MONDAY, JULY 20TH.

9.0 a.m.—Council Meeting.  
 10.0 a.m.—Representative Meeting.  
 7.45 p.m.—Gala Performance, Theatre Royal.

## TUESDAY, JULY 21ST.

9.30 a.m.—Official Opening of Annual Exhibition.  
 10.15 a.m.—Representative Meeting.  
 2.0 p.m.—Annual General Meeting, followed by Representative  
 Meeting. Abbey.  
 President's Address.

## WEDNESDAY, JULY 22ND.

1.0 p.m.—Representative Meeting.  
 7.15 p.m.—Gala Performance, Theatre Royal.

## THURSDAY, JULY 23RD.

9.0 a.m.—Representative Meeting.  
 10.0 a.m.—Representative Meeting.  
 2.0 p.m.—Representative Meeting.  
 7.15 p.m.—Gala Performance, Theatre Royal.  
 7.45 p.m.—Gala Performance, Theatre Royal.  
 10.0 p.m.—Reception by Bath Division.

## FRIDAY, JULY 24TH.

10.0 p.m.—Representative Meeting.  
 2.0 p.m.—Representative Meeting.  
 8.0 p.m.—Representative Meeting.  
 9.0 p.m.—Representative Meeting.

The Honorary Local General Secretary is Mr. W. G. MUMFORD, O.B.E., F.R.C.S. (British Medical Association Committee Rooms, Assembly Rooms, Bath); and the Honorary Assistant Secretary is Dr. R. G. GORDON.

## British Medical Association.

## CURRENT NOTES.

## Summer Time.

THE British Medical Association is pledged to help in securing permanent summer time legislation, and has already taken action in combination with the Early Closing Association, which has acted as the pioneer in this matter. Colonel Lambert Ward, M.P., will introduce the Summer Time Bill on March 13th, and it is believed that the decision of the House of Commons on that evening "will practically decide the fate of the bill for all time. In other words, if this bill is lost on March 13th there is no possible hope of the Government carrying any bill for summer time this year, and this great boon may be lost for many years, if not altogether." Members of the Association are requested to write to their members of Parliament asking them to be in the House on March 13th next to support Colonel Lambert Ward.

## The Life Extension Institute.

The "Life Extension Institute of Great Britain, Ltd.," appears from documents it issues to have been formed to provide members of the public with a detailed report of their state of health, made after medical examination by "fully qualified physicians of the highest skill," who are also spoken of as "our examiners." According to the scale of charges issued by the Islington branch of the institute, the fee for "standard full physical examination, including x-ray check up" is three guineas for an adult; reduced fees are charged for young persons, and clergymen and their wives, doctors, pharmacists, and ex-service men. The inference to be drawn from the documents issued is that the profits of the company will be derived from the difference between fees charged to the persons examined and those paid to the qualified physicians who make the examinations. The matter has been brought under the consideration of the Central Ethical Committee of the British Medical Association, which is of opinion that a practitioner who associates himself with this institute by way of examining patients does so with risk to his professional good name and reputation.

## Salaries of Assistants.

The British Medical Association has often been pressed lately to try to fix some minimum salary for the payment of assistants in medical practices, and the problem is at present under consideration. Any delay in dealing with it arises, not from any want of sympathy, but from an acute apprehension of the difficulties surrounding the subject. The circumstances of medical practices differ so much that what would be a fair salary for a man or woman helping in a busy general practice in an industrial area would be inappropriate for one helping a doctor who wished to have an assistant in a not very hard-worked practice so that the principal could take things a little easier. It would be unwise to fix a rate which would discourage practitioners in the circumstances just mentioned from employing assistants, for this would contract the field in which young practitioners, to their great future benefit though with only a small present financial return, expect to gain experience. The Medical Secretary would be glad to hear from medical men and women who have recently been assistants or have employed them and who have views as to the practicability of fixing a minimum commencing salary.

## Salaries of Whole-time Public Health Officers employed by Joint Committees.

A conference of representatives of the British Medical Association, the Society of Medical Officers of Health, and the Medical Women's Federation, recently considered the question of what should be the salaries of medical officers employed either by two or more district councils, or by a district council which arranges with the county council to allow one of its assistant medical officers to become a district medical officer of health for a definite proportion of his time. It was agreed—

(1) That where two or more districts combine to appoint a medical officer of health to serve under a joint committee, such M.O.H. being permitted to accept part-time duties (for example, as tuberculosis officer, school medical officer, etc.) under a county council, the combined remuneration should not be any less than the minimum commencing salary of a whole-time medical officer of health as indicated by the population of the combined areas in the scale of commencing salaries approved by the Association.

(2) That where an assistant medical officer under a county council is allowed to become a district medical officer of health for a definite proportion of his time, such assistant medical officer should receive at the rate of £80 per annum for each half-day per week allocated for his duties as district medical officer of health, and his salary as assistant medical officer to the county council should be reduced by one-eleventh for each half-day per week that he serves as district M.O.H.

It is believed that these suggestions, which apply only to whole-time appointments, should be of considerable assistance to county and district councils in making such arrangements as are indicated above. It is also believed that if such arrangements were to become more common it would be greatly to the benefit of the public health service, as the assistant medical officer under the county council would benefit by the wider experience and greater responsibility that he would gain from the district appointment, while the fact that, besides holding the district or combined

appointment, he had been an officer under the county council and thus able to get a knowledge of county administration, would be of distinct advantage to him were he to apply for a higher position. Members of the profession, and particularly those in the public health services, will be glad to know that as a result of the various conversations that have taken place under the auspices of the Ministry of Health, it is felt that the time has now arrived when the scale of commencing salaries as modified by those conversations may be issued to all local authorities in a definitive form.

## Association Notices.

### SPECIAL REPRESENTATIVE MEETING.

NOTICE is hereby given that a Special Representative Meeting of the Association will be held in the Wesleyan Central Hall, Westminster, London, on Thursday, March 12th, 1925, at 9.30 in the forenoon, on the requisition of the Council, to consider the following motion:

That the members of the Representative Body present be authorized to attend a Conference called for Thursday, March 12th, and (if necessary) Friday, March 13th, 1925, at 10 a.m., in association with representatives of Local Medical and Panel Committees, to consider a Memorandum of Evidence proposed to be submitted to the Royal Commission on National Health Insurance.

By order of the Chairman of the  
Representative Body,  
ALFRED COX,  
Medical Secretary.

February 18th, 1925.

### TABLE OF DATES.

Mar. 16, Mon.	Branch Reports for 1924 due by this date.
Mar. 25, Wed.	Council.
Mar. 30, Mon.	Nomination papers available for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service representatives.
April 11, Sat.	Annual Report of Council.
April 25, Sat.	Last day for receipt of 24 members of Council by grouped Home Branches, and of 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 9, Sat.	Publication in SUPPLEMENT of nominations for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives. Voting papers posted.
May 12, Tues.	Independent motions for A.R.M. Agenda must be received at Head Office by this date.
May 16, Sat.	Last day for receipt of voting papers for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 30, Sat.	Publication in SUPPLEMENT of independent motions for A.R.M. Agenda. Representatives and Deputy-Representatives must be elected by this date.
	Publication in SUPPLEMENT of results of Council elections by grouped branches, and of election of members of Council and Representatives in Representative Body by Public Health Service members.
June 4, Thurs.	Nomination papers available for election of 12 members of Council by grouped Home Representatives must be received by this date.
June 10, Wed.	Council.
June 16, Thurs.	Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.
June 27, Sat.	Supplementary Report of Council appears in SUPPLEMENT.
July 3, Fri.	Amendments and riders for issue in A.R.M. Agenda must be received by this date.
July 17, Fri.	Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.

ALFRED COX, Medical Secretary.

### BRANCH AND DIVISION MEETINGS TO BE HELD.

**KENT BRANCH.**—The quarterly meeting of the Kent Branch will be held at the Royal Crown Hotel, Sevenoaks, on Thursday, March 12th, at 2.45 p.m. Dr. T. A. Ross, medical director of the Cassel Hospital for Functional Nervous Disorders, Petersham, will read a paper on neurasthenia. Lunch at the Royal Crown Hotel at 1.45 p.m.; charge, 3s. 6d. each. Members intending to be present at the lunch are requested to notify the hotel management not later than Tuesday, March 10th.

**LANCASHIRE AND CHESHIRE BRANCH: HYDE DIVISION.**—At a meeting of the Hyde Division to be held at the Hyde Town Hall on Thursday, March 12th, at 8.30 p.m., Dr. Ralphs will give his impressions of a short visit to the United States of America.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, on Tuesday, March 10th, at 9.30 p.m., when Sir H. E. Bruce-Porter will read a paper on medical practice and its pitfalls.

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—The Kensington Divisional dance will be held at the Kensington Town Hall

on Thursday, May 7th. All money over after expenses have been paid will be handed to the Royal Medical Benevolent Fund and the Royal Medical Benevolent Guild. Further details will appear later, or can be obtained from the Honorary Secretary, 20, Upper Phillimore Place, W.8.

**METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.**—A meeting of the South Middlesex Division will be held at St. John's Hospital, Twickenham, on Wednesday, March 25th, at 8.30 p.m., when Dr. C. E. Herington will open a discussion on early diagnosis of syphilis.

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—At the meeting of the Chesterfield Division, to be held at the Internity Hospital, Chesterfield, on Friday, March 13th, Dr. A. J. Hall, professor of medicine, University of Sheffield, will give an address on "Diagnostic Bunkers."

**MIDLAND BRANCH: LEICESTER AND RUTLAND DIVISION.**—A meeting of the Leicester and Rutland Division, to which all members of the profession are invited, will be held at the Medical Club, Bond Street, Leicester, to-day (Friday, March 6th), at 8.30 p.m. Agenda: Election of Representatives to the Representative Body; consideration of amended report to the Royal Commission on the working of National Health Insurance Acts; an address will be given by Dr. R. Sevestre on cardiac pain.

**NORTH OF ENGLAND BRANCH: GATESHEAD DIVISION.**—A second meeting of the members of the medical profession residing or practising in the area of the Gateshead Division has been called for to-day (Saturday, March 7th), at 8.30 p.m., at 9, Walker Terrace, Gateshead. Agenda: Further consider the draft Memorandum of Evidence to be placed before the Royal Commission on the National Health Insurance Acts; instruct the local representatives prior to the Central Joint Meeting of Representatives of Divisions and of Panel Committees to be held on March 12th. Members are requested to bring to the meeting the BRITISH MEDICAL JOURNAL SUPPLEMENT of February 28th, 1925.

**SOUTH WALES AND MONMOUTHSHIRE BRANCH: SWANSEA DIVISION.**—A meeting of the Swansea Division will be held at the General Hospital, Swansea, on Thursday, March 12th, at 8.15 p.m., when Mr. T. Bernice Tustian, L.D.S., will read a paper on oral examination and diagnosis as carried out by a dentist.

**SOUTHERN BRANCH: WINCHESTER DIVISION.**—A meeting of the Winchester Division will be held at 4, The Square, Winchester, on Thursday, March 19th, at 3.30 p.m., when a British Medical Association Lecture will be given by Professor H. Maclean on the present position of endocrine diseases from a clinical standpoint.

**SOUTH-WESTERN BRANCH: EXETER DIVISION.**—A meeting of the Exeter Division will be held in the Library of the Royal Devon and Exeter Hospital on Monday, March 9th, at 4 p.m., to consider the revised draft Memorandum of Evidence proposed to be placed before the Royal Commission on National Health Insurance, and to instruct the Representative thereon.

**SUFFOLK BRANCH: SOUTH SUFFOLK DIVISION.**—A general meeting of the South Suffolk Division will be held in the Town Hall (Magistrates' Room), Ipswich, to-day (Friday, March 6th), at 2.30 p.m. Agenda: Business arising out of minutes; amended evidence to be placed before the National Health Insurance Royal Commission (SUPPLEMENT of the BRITISH MEDICAL JOURNAL, February 28th) to be fully discussed and the Division's Representative instructed how to vote at the forthcoming Conference in London on March 12th.

**SURREY BRANCH: CROYDON DIVISION.**—A meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday, March 31st, at 8.30 p.m., when Dr. H. W. Barber will deliver an address on diseases of the skin.

**SURREY BRANCH: GUILDFORD DIVISION.**—The Guildford Division will hold a clinical meeting in the wards of the Royal Surrey County Hospital, Guildford, on Thursday, April 2nd, at 4 p.m.; tea at 3.45 p.m.

**YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.**—At the meeting of the Wakefield, Pontefract, and Castleford Division, to be held at the Bull Restaurant, Wakefield, on Thursday, March 12th, Mr. E. W. Bain, F.R.C.S. (Leeds), will give a lecture on middle-ear suppuration.

**YORKSHIRE BRANCH: SHEFFIELD DIVISION.**—A general meeting of the profession will be held at the Church House, St. James's Street, Sheffield, to-day (Friday, March 6th), at 8.30 p.m. Agenda: Consider draft Memorandum of Evidence to be presented before the Royal Commission on the National Health Insurance Acts as revised in accordance with the views of the recent local meetings of the profession (SUPPLEMENT, February 28th); instructions to Representatives of the Sheffield Division and of the Panel Committee.

## Meetings of Branches and Divisions.

**BIRMINGHAM BRANCH: NUNSTON DIVISION.**—A meeting of the Nunston Division was held at Atherstone on February 25th. were then demonstrated: Dr. Jones—circoid aneurysm of supracondylar fracture of humerus; Dr. E. N. Nason—photographs and microscopic slides of a case of osteitis deformans. A vote of thanks to Mr. D. S. Pracy for arranging the demonstration and to the Atherstone members for entertaining the Division concluded the meeting.

Proof copies of the oral evidence and the relative statements submitted at the meetings of February 5th and of February 22th may be obtained from H.M. Stationery Office, Adnstral House, Kingsway, London, W.C.2, on remittance of cost (2s. 3d. each) and postage.

**LONDON PANEL COMMITTEE.**  
At a meeting of the London Panel Committee on February 24th, Dr. H. J. CARDALE presiding, the question of the constitution and work of the Committee came forward for discussion, and certain recommendations relating to the work of subcommittees, and to secretarial duties were adopted. It was agreed to consider the appointment of an assistant secretary, one of whose duties would

be the general organizing of the profession in London in the local areas. A proposal to remunerate the members of the Committee fell through.

**Tuberculosis Care Committees.**—The question of representation on tuberculosis care committees was discussed. It was stated that the duties of these committees were purely routine and that the attendance of medical members thereon was entirely unnecessary. The Committee agreed that "having considered the present unsatisfactory working of tuberculosis care committees, due to their limitations," it was of opinion that the London County Council should be urged to take steps so to amend the regulations under which the committees worked that medical men might find their services better utilized. It was agreed also to bring this decision of the Committee to the notice of an impending conference of London care committees.

**Unsuitable Conditions of Practice.**—The Committee had before it the case of a practitioner whose surgery and waiting-room accommodation was alleged to be not of a proper and sufficient nature. It had been referred by the Insurance Committee to the Panel Committee. Some very undesirable conditions were found on the occasion of a visit of inspection. On a further report from members who had been delegated to visit the premises, the Panel Committee passed a resolution expressing the opinion that the conditions were due to certain physical ailments from which the practitioner was suffering and also to the prolonged and serious illness of a member of his family. It was stated that the practitioner was now in hospital, and that arrangements had been made for a neighbouring practitioner to attend to the practice during the illness.

#### LONDON INSURANCE COMMITTEE.

A MEETING of the London Insurance Committee was held on February 26th. There was again no report from the Medical Service Subcommittee, owing to the controversy as to its chairmanship and its failure to form a quorum (SUPPLEMENT, January 31st, p. 53). It was decided to call a special meeting of the Insurance Committee to consider the situation.

**Improper Use of Certification Form.**—It was reported that the Ministry of Health had dismissed an appeal by a practitioner against a decision of the Committee, the costs of the Committee, not exceeding £2, to be paid by the practitioner. It appeared that an insured member of an approved society, who had been receiving certificates of incapacity from the doctor, stated that she wished to declare off benefit because she dreaded the visits of the society's sick visitor, who, she alleged, bullied her. The doctor was unwilling to take her off, but on her persisting, he gave her a final certificate, with some alteration of the words of the form, and inserted the remark, "You are not fit for work, but want to sign off owing to your being bullied and harassed and annoyed by your sick visitor." The Medical Service Subcommittee recommended cautioning the practitioner, but the full committee altered the caution into a censure. The Ministry of Health stated in its report that two courses were open to the practitioner. He was under no obligation to give any certificate at all, and might so have informed the patient, or, if he was anxious, as it was believed he was, to further the patient's interests, he might have written a letter to the society suggesting that it could with advantage alter its arrangements for having her visited. It was added that he had been warned in a previous case of a somewhat similar character against the improper use of certification forms.

**Interpretation of the Term "Aqua."**—It was announced that the Ministry of Health had formulated an interpretation of the term "aqua." Where this term was used on a prescription without qualification it should be interpreted by the chemist to mean ordinary potable water, except that it should be interpreted to mean distilled water (1) where the Insurance Committee, after consultation with the Panel and Pharmaceutical Committees, had decided, with the Minister's approval, that the water ordinarily available was unsuitable for dispensing purposes, (2) in the case of all preparations intended for application to the eye, and (3) in cases where, in the opinion of the chemist, the use of ordinary water would result in an undesirable alteration in the character of the medicament prescribed, in which last case the use of distilled water should be recorded by the chemist on the prescription form. The Pharmaceutical Committee agreed with the interpretation.

## Naval and Military Appointments.

#### ROYAL NAVAL MEDICAL SERVICE.

To be Surgeon Lieutenant: W. H. Bradfield, and appointed to R.N. Hospital, Haslar, for course.

#### ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Lieutenant Commander A. G. V. Elder, D.S.C., to the Victory for R.N. Barracks, for fourteen days' training.

Late temporary Surgeon Lieutenant (R.N.) H. E. Hall entered as "attached to Ulster Division," Lieutenant H. M. Willoughby to the Tiger, days' training.

### British Medical Association.

#### CURRENT NOTES.

#### Election of the Twenty-four Members of Council, 1925-26

NOMINATION forms for election of the twenty-four members of Council, 1925-26, (a) by a Division, and (b) by not less than three members of a Branch, are now available on application to the Medical Secretary, British Medical Association, 429, Strand, W.C.2.

#### Election of Public Health Service Members on the Council and Representative Body.

The constitution of the British Medical Association provides for nomination and election by the Public Health Service members of the Association as a whole, in the United Kingdom, of (1) two members of the Council, and (2) four Representatives (and four Deputy-Representatives) in the Representative Body of the Association. A Public Health Service member is defined (By-laws 1 and 10) as a member of the Association permanently employed in the whole-time medical service (other than service at a mental hospital) of any council or education authority of any county, county borough, municipal borough, metropolitan borough, burgh, urban district, rural district, parish, or port sanitary authority in the United Kingdom whose name appears as such member in the annual list of members of the Association. The term of office of those elected begins with the commencement of the Annual Representative Meeting at Bath this year, and terminates at the commencement of the Annual Representative Meeting, 1926.

Nomination papers are now available on application to the Medical Secretary, and must be returned to him not later than Saturday, April 25th, 1925. Separate nomination papers are necessary for nominations for the Council and for the Representative Body. Members elected to the Council are *ex officio* members of the Representative Body. If more candidates are nominated than vacancies exist, voting papers containing the names of all candidates will be issued through the post to all Public Health Service members of the Association on May 9th, and must be returned so as to reach the Medical Secretary not later than May 16th, 1925. The counting of the votes will be conducted in accordance with, and the result of the election ascertained by, the method of the single transferable vote. In the election of Representatives, first preferences given for any candidate who is elected to one of the two seats on the Council will be ignored, as such member of Council becomes *ex officio* a member of the Representative Body. The voting papers affected will not be invalidated, as the remaining preferences shown thereon will be used. The four candidates who head the poll for election of Repre-

sentatives will be elected Representatives, and the next four will be elected Deputy-Representatives, the fifth successful candidate acting as deputy for the first successful candidate, the sixth as deputy for the second, the seventh as deputy for the third, and the eighth as deputy for the fourth.

#### West Riding County Council and its Medical Staff.

The West Riding County Council is at the present moment advertising for five school medical inspectors at a salary of £500 a year, rising by £25 a year to £650. These advertisements do not appear in the *BRITISH MEDICAL JOURNAL* because the appointments are offered at a rate less than that agreed by the Association, and the county council knows from past experience that it is useless to offer such advertisements to the *JOURNAL*. It is very discouraging to find a public authority of the size and importance of the West Riding County Council following so short-sighted a course, when it must know that it is not only restricting its choice of medical officers, and thereby deliberately lowering the standard of the medical service of the county, but is taking a view which does not meet with the sympathy of the Ministry of Health. The Ministry, in a circular letter, has declared that it considers the scale of the Association, as now modified and safeguarded, to be not unreasonable, and the Association of Municipal Corporations is, we understand, circulating the scale with an intimation that it considers it to be not unreasonable as a guide to employing authorities. During the past twelve months over eighty appointments of assistant medical officers have been made at the rate of £600 a year, which the Association considers to be reasonable as a commencing salary for a fully qualified medical man or woman with at least three years' clinical experience. Thus members of the profession who have trained with the idea of entering the public medical service, and who may be tempted by the prospect of immediate appointment at £500 a year, may well hesitate before they fly in the face of the expressed opinion of their own professional organizations. Apart from loyalty to their own profession, they should remember that they are entering on a career in which the prizes are extremely few, and with a decided probability that the £650 a year to which they may aspire if they remain with the West Riding County Council for six years is the financial end of their professional career. The British Medical Association, in conjunction with the Society of Medical Officers of Health, and with the valued assistance of the *Lancet* and the *Medical Officer*, has fought and will continue to fight for the improvement of the salaries and status of members of the public health services, but its task will be rendered much more difficult if the very people for whom the fight is being waged are not loyal enough or not far-sighted enough to resist temptations held out to them by cheese-

### The Sir Charles Hastings Clinical Prize for General Practitioners.

The Council of the British Medical Association has decided to establish experimentally an annual prize—"The Sir Charles Hastings Clinical Prize"—of fifty guineas for an essay or lecture for the purpose of stimulating systematic observation, research, and record in general practice. The Council believes that systematic observation by general practitioners, along selected lines of clinical study, may result in the production of practical contributions of great value by those who are in a favourable position for following disease through its various stages.

The first prize will be awarded in 1926, and the conditions governing its award, as adopted by the Council on April 16th, 1924, are as follows:

#### Regulations.

1. This prize is established by the Council of the British Medical Association for the promotion of systematic observation, research, and record in general practice; it includes a money award of the value of fifty guineas.

2. Any member of the Association who is engaged in general practice is eligible to compete for the prize.

3. The work submitted must include personal observations and experience of the candidate collected in general practice, and a high order of excellence will be expected. If no essay entered is of sufficient merit no award will be made.

4. Essays, or whatever form the candidate desires his (or her) work to take, must be sent to the Medical Secretary, British Medical Association, 429, Strand, W.C.2, not later than December 31st, 1925, and the prize will be awarded at the Annual General Meeting of the Association. The first award will be made in 1926.

5. If any question arises in reference to the eligibility of the candidate or the admissibility of his essay, the decision of the Council on any such point shall be final.

6. Each essay must be distinguished by a motto, and must be accompanied by an envelope marked with the same motto and including the candidate's name and address.

7. The candidate who gains the award shall, if the Council so desires, publish his paper in the *BRITISH MEDICAL JOURNAL* or deliver a lecture on the subject thereof at a meeting of the Association.

8. Inquiries relative to the prize should be addressed to the Medical Secretary, 429, Strand, London, W.C.2.

### Association Notices.

#### BRANCH AND DIVISION MEETINGS TO BE HELD.

**BIRMINGHAM BRANCH: NUNEATON AND TAMWORTH DIVISION.**—At the meeting of the Nuneaton and Tamworth Division, to be held at the Nuneaton General Hospital on Wednesday, April 1st, Mr. C. A. Raison, F.R.C.S. (Birmingham), will read a paper on the acute abdomen in the child.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, E.8, on Tuesday, April 14th, at 9.30 p.m., when Dr. H. Maclean will read a paper entitled "Diabetes—its treatment: insulin up to date."

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—The Kensington Divisional dance will be held at the Kensington Town Hall on Thursday, May 7th. All money over after expenses have been paid will be handed to the Royal Medical Benevolent Fund and the Royal Medical Benevolent Guild. Further details will appear later, or can be obtained from the Honorary Secretary, 20, Upper Phillimore Place, W.8.

**METROPOLITAN COUNTIES BRANCH: LUTON DIVISION.**—A meeting of the Luton Division will be held at the Luton Hospital, 8.45 p.m., at the Parish Room, St. Peter's Church, Luton, on Wednesday, April 15th, when Dr. F. A. Cook, F.R.C.S., will read a paper on "Painful menstruation."

**METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.**—A meeting of the South Middlesex Division will be held at St. John's Hospital, Twickenham, on Wednesday, March 25th, at 8.30 p.m., when Dr. C. E. Herington will open a discussion on the early diagnosis of syphilis.

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, on Friday, April 3rd, at 8.30 p.m., when Dr. A. E. British Medical Association Lecture on some recent advances in endocrinology.

**NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.**—A scientific meeting of the Sunderland Division will be held at Highfield

Hospital, Sunderland, on Wednesday, March 25th, at 7.30 p.m. The Division will also hold a scientific meeting at the Mental Hospital, Ryhope, on Wednesday, May 27th, at 3.30 p.m. All members of the Division are invited to be present at the meetings.

**SOUTH WALES AND MONMOUTHSHIRE BRANCH: SWANSEA DIVISION.**—A meeting of the Swansea Division will be held at the General Hospital, Swansea, on Thursday, March 26th, at 8.15 p.m., when a series of short papers will be read.

**SOUTHERN BRANCH: WINCHESTER DIVISION.**—A meeting of the Winchester Division will be held at 4, The Square, Winchester, on Thursday, March 19th, at 3.30 p.m., when a British Medical Association Lecture will be given by Professor H. Maclean on the present position of endocrine diseases from a clinical standpoint.

**SURREY BRANCH: CROYDON DIVISION.**—A meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday, March 31st, at 8.30 p.m., when Dr. H. W. Barber will deliver an address on the etiology and treatment of some common diseases of the skin.

**SURREY BRANCH: GUILDFORD DIVISION.**—The Guildford Division will hold a clinical meeting in the wards of the Royal Surrey County Hospital, Guildford, on Thursday, April 2nd, at 4 p.m.; tea at 3.45.

**YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.**—A meeting of the Wakefield, Pontefract, and Castleford Division will be held at the Ball Restaurant, Westgate, Wakefield, on Thursday, April 23rd, at 8.30 p.m., when Mr. J. F. Dobson, F.R.C.S. (Leeds), will read a paper on urological diagnosis (illustrated with lantern slides). Supper at 8 o'clock.

#### TABLE OF DATES.

Branch Reports for 1924 due by this date.	
Mar. 16, Mon.	Council.
Mar. 25, Wed.	Nomination papers available for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Representatives of Public Health Service in Representative Body.
Mar. 30, Mon.	Annual Report of Council appears in SUPPLEMENT.
April 11, Sat.	Last day for receipt of nominations for election of 24 members of Council by grouped Home Branches, and of 2 Public Health members of Council, and 4 Public Health Service Representatives.
April 25, Sat.	Publication in SUPPLEMENT of nominations for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives. Voting papers posted.
May 9, Sat.	Independent motions for A.R.M. Agenda must be received at Head Office by this date.
May 12, Tues.	Last day for receipt of voting papers for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 16, Sat.	nt motions for Deputy-Representatives must be elected by this date.
May 30, Sat.	Publication in SUPPLEMENT of results of Council elections by grouped Branches, and of election of members of Council and Representatives in Representative Body by Public Health Service members.
June 4, Thurs.	Nomination papers available for election of 12 members of Council by grouped Home Representatives.
June 10, Wed.	Names of Representatives and Deputy-Representatives must be received by this date.
June 18, Thurs.	Council.
June 27, Sat.	Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.
July 3, Fri.	Supplementary Report of Council appears in SUPPLEMENT. Amendments and riders for issue in A.R.M. Agenda must be received by this date.
July 17, Fri.	Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.
July 18, Sat.	Annual Representative Meeting, Bath.
July 20, Mon.	Council, and Annual Representative Meeting, Bath.
July 21, Tues.	Annual Representative Meeting. Annual General Meeting, Bath, President's Address.
July 22, Wed.	Council, Meetings of Sections, Conference of Honorary Secretaries, Bath.
July 23, Thurs.	Meetings of Sections, etc., Bath.
July 24, Fri.	Meetings of Sections, etc., Bath.

ALFRED COX, Medical Secretary.

#### Meetings of Branches and Divisions.

**BORDER COUNTIES BRANCH: DUMFRIES AND GALLOWAY DIVISION.** A very successful meeting of the Dumfries and Galloway Division was held in the Royal Infirmary, Dumfries, on February 26th, when Dr. P. M. Kerr presided. Lecture arrangements were discussed, and it was agreed to have a social meeting at Dalry, either in June or early July.

An advance copy of the revised evidence before the Royal Commission on National Health Insurance, together with a typescript by Dr. Anderson, Deputy Medical Secretary, setting out in detail the alterations, was before the meeting. After discussion the opinion was expressed that the attitude towards dependants now taken up was not logical.

The discussion on the Scottish Departmental Committee's report on puerperal morbidity and mortality was resumed, and it was decided to offer no objection to the recommendations on pages 30 and 31 of the report, except Nos. 5 and 15, to both of which it was agreed, after a vote, that opposition should be offered.

## METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.

A MEETING of the Camberwell Division was held at the Brompton and Rotherhithe Hospital on March 4th. The revised draft Memorandum of Evidence proposed to be placed before the Royal Commission on National Health Insurance was considered and approved.

The HONORARY SECRETARY reported that the Divisional stage of the Treasurer's Cup golf competition had been completed, and that Dr. Clatworthy would represent Camberwell in the Branch stage of that competition.

Dr. N. MURCH, assistant physician to Guy's Hospital, gave an address on rheumatoid arthritis, and was listened to with great interest. A discussion followed, and questions were asked, to which Dr. Mutch replied. The meeting closed with a hearty vote of thanks to the lecturer.

## METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.

A MEETING of the South Middlesex Division was held at St. John's Hospital, Twickenham, on February 25th, when Dr. G. S. EWIN was in the chair.

Dr. SHORE read a paper on hilum tuberculosis, with some observations on artificial pneumothorax. He mentioned the various methods of classification of tuberculosis, and drew attention to the existence of a unilateral type of this disease. He regarded apical phthisis as being an inhalation phenomenon, and considered that animal experiments had proved this. The extreme apex was seldom attacked; the mode of spread was definite; several skiagrams were shown to demonstrate this type. Dr. Shore gave figures dealing with the unilateral type of tuberculosis, and remarked on skiagrams of four cases. He next dealt with tuberculous glands in the mediastinum, and stated that this might occur either by blood infection or from the lung itself. He gave figures of Anton Ghon, who made 724 autopsies on children under 10 years of age; 184 had tuberculous glands in the mediastinum, and of these 170 had lung involvement. He classified the groups of glands found here and quoted Ghon: (a) lung focus gives glands in mediastinum; (b) if the position of affected glands is known, the lung lesion can be forecast. In discussing the nomenclature of hilum, Dr. Shore suggested that a back flow occurred at the hilum of the lungs, and showed two specimens of apparently normal intestine with diseased glands and enlarged lymphatics. Skiagrams were shown relating to hilum cases.

A discussion followed, and the CHAIRMAN thanked Dr. Shore for his excellent paper.

## METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.

A MEETING of the South-West Essex Division was held at the Jubilee Hospital, Woodford, Essex, on March 3rd.

Among the local business discussed was the proposition for holding an annual dinner of the Division in conjunction with the Essex Panel Committee.

Dr. C. H. PANTING was elected as Representative of the Division for 1924-25, and was instructed to attend the Special Representative Meeting on March 12th.

Mr. C. H. S. FRANKAU, C.B.E., D.S.O., read a paper on tuberculous glands of the neck. This was followed by a discussion in which several members took part.

## METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

Dr. C. F. T. SCOTT presided at the February meeting of the Willesden Division, when Dr. Lock read a lucid report on the conference on venereal disease held at Wembley Exhibition last summer, and received a hearty vote of thanks.

It was decided to remit to the Organization Committee Dr. Gillbard's proposal that copies of the lists of members should be sent to members once a year. Dr. Lock's report of the Entertainments Committee showed that the first dinner of the Division had been a success in every way, and he was thanked for the trouble he had taken.

Dr. Skene, Chairman of the Willesden Public Health Committee, having intimated that he would again seek election to the Urban District Council on April 6th, it was decided to support Dr. Skene in every way possible, and also Dr. Lock, should he decide to stand.

The CHAIRMAN, in presenting Mr. S. Coulson with a silver cigarette case and fountain pen as tokens of appreciation, referred to the assistance Mr. Coulson had given with the work of the Division and the great interest he took in everything connected with the profession. The HONORARY SECRETARY (Dr. William Paterson) added a word of thanks, saying that Mr. Coulson had lightened his labours very considerably. Mr. COULSON, in thanking the members, said that it had been a pleasure for him to attend the meetings of the Division and to gain a knowledge of the work locally as distinct from that at the Central Office.

## ORANGE FREE STATE AND BASUTOLAND BRANCH.

The annual general meeting of the Orange Free State and Basutoland Branch was held in the Bloemfontein Club on February 12th, when Mr. VELLACOTT was in the chair.

In making his report the SECRETARY enumerated the meetings held during the year, and described briefly the work of the Branch Council in ethical and other matters. The report was, on the motion of Dr. BIDWELL, adopted.

The Treasurer's report was adopted on the motion of Dr. DE KOCK. In this connexion it was resolved that in future some provision should be made towards the payment or part payment of delegates' expenses to the South Africa Committee or other conferences—the method of provision to be decided by the Branch Council.

Mr. VELLACOTT, in the course of his presidential address, reviewed the meagre account of the year's work, and contrasted it with that

of the British Medical Association in England, which he asserted was a busy, flourishing, and extremely influential body. He referred to the panel system as another successful institution, which, though much grumbled at, had proved inestimably useful to England, and he suggested that it might be profitably copied in South Africa. He then gave an account of a very interesting and unusual case of gastric ulcer. The ulcer was in the lesser curvature in a child of 5 years; after treatment in the usual way the child underwent a slow but uneventful convalescence. Mr. VELLACOTT closed his remarks by contrasting the first operation he had ever witnessed, with its carbolic sprays, sponges, wooden table, etc., and the wonderful modern surgery he had recently seen in Europe. On the motion of Dr. EDWARDS a very hearty vote of thanks was accorded to Mr. VELLACOTT for his address.

The following office-bearers were elected for the coming year:

President, Mr. H. A. BODKIN. Vice-President, Dr. H. C. WATSON. Secretary, Dr. ALICE COX. Treasurer, Dr. R. Theron.

Dr. BONNIE thanked the Branch for doing him the honour of electing him President; and in response to his request for an instruction with regard to the meetings to be held during the year it was resolved to instruct the President and Secretary to call general meetings on the second Fridays of alternate months, and to invite non-members to such meetings as should be clinical in character.

The following motion, proposed by Dr. BIDWELL, was carried:

That this Branch is prepared to attend members of the Public Service Medical Benefit Association at the minimum fees agreed upon by the Branch in 1920, and it agrees to the deduction of 10 per cent. for collection on the understanding that accounts are paid promptly every month.

The proposal of the South Africa Committee to transfer the power of expulsion from Branches to itself was discussed and approved.

The meeting closed with a hearty vote of thanks for his services to the retiring President.

## SOUTH-WESTERN BRANCH: TORQUAY DIVISION.

A MEETING of the Torquay Division was held on March 6th at the Torbay Hospital, to which non-members as well as members of the Association were invited. The revised draft Memorandum, which appeared in the SUPPLEMENT of February 28th, was discussed, and the opinion was expressed that it was preferable to extend the scope of service to those persons at present insured, rather than to include dependants of insured persons.

## YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.

The fifth of the seven monthly lecture meetings arranged by the Wakefield, Pontefract, and Castleford Division for the present winter session was held at Wakefield on February 12th, under the chairmanship of Dr. WILLIAM STEVEN (Featherstone), when Mr. S. W. DAW, F.R.C.S. (Leeds), gave an address on modern treatment of fractures. Mr. Daw first dealt with the points generally to be aimed at in the treatment, and then with the actual methods employed at Leeds General Infirmary. The address, which was interesting and useful, was illustrated by a number of skiagrams. Dr. STEVEN, Dr. CLAYTON, Dr. DUFF, Dr. HILLMAN, and others joined in the subsequent discussion, and Mr. Daw was heartily thanked for his address.

## MATERNAL MORTALITY.

## MISS BONDFIELD'S CRITICISMS.

A MEDICAL man recently directed the attention of the Medical Secretary of the British Medical Association to the following extract from the *Daily Mail* of February 27th, which appeared under the headings "Death Rate of Mothers. Miss Bondfield and Careless Doctors":

"Miss Margaret Bondfield, addressing a conference of the National Association of Trade Union Approved Societies at York yesterday, said that of 700,000 mothers who gave birth to children annually 3,000 died and a vastly greater number were injured."

"While there had been a remarkable decline in the infantile mortality in the last twenty years, there had been practically no diminution in the maternal mortality. Nine of 10 boroughs with the heaviest death rates from this cause were textile towns of Lancashire and Yorkshire. There was evidence of it being due to definitely bad and careless doctoring."

"It made one's blood boil, she said, to hear of case after case of death through the failure of doctors properly to sterilize instruments and their hands. There were few—but too many—cases of lives being lost through the downright neglect of doctors who gave too little attention to cases and failed to come at the danger period."

The Medical Secretary thereupon wrote to Miss Bondfield (who, it will be remembered, was a member of the Cabinet in the late Labour Government, holding the office of Parliamentary Secretary, Ministry of Labour), and received from her the following letter in reply:

Dear Dr. Cox,

March 5th, 1925.

With reference to your letter of the 2nd inst., I have to inform you that the occasion of my speech was the Annual Conference of the National Association of Trade Union Approved Societies, where I spoke for upwards of an hour on the subject of maternal mortality.

following day, when the further message should have aroused his suspicion and induced him to make a call at least earlier than 12.30 in the day.

(iii) At the same time we doubt whether the word "negligence" is apt as a description of the criticism set out in the preceding paragraph. Certainly gross negligence as alleged in the representation cannot be imputed to the respondent. We would rather describe our criticism as connoting an error of judgement as to the urgency of the case having regard to the information possessed by the respondent on the evening of June 30th and the morning of July 1st.

(iv) It is quite impossible to attribute the death of the deceased to anything done or left undone by the respondent. It is equally impossible to put forward an accurate opinion as to the time at which the onset of appendicitis occurred. It is only fair to the respondent to discount the fact that the patient died. He might have died in any event, and his death might equally have been attributable to the six hours' interval which occurred between the time of his admission to the infirmary and the time of the operation. These are matters of speculation which, in our view, particularly having regard to the conditions found at the operation, do not assist in determining the issues raised in the representation.

(v) We observe that the representation was based upon a charge of negligence in relation only to a single case.

"7. Evidence was tendered on the respondent's behalf to show that he was generally careful and skilful in his insurance practice. We rejected this evidence (a) as irrelevant in law to a charge of negligence in a single specific case and where no question of credibility or honesty as a witness was in question; (b) as directed to the issue whether or not the respondent's continuance on the list of insurance doctors was desirable. We respectfully submit that under the present regulations we were correct in our ruling, and in explanation of (b) above we observe that in our view the functions of the Inquiry Committee are limited to an investigation of particular facts stated in the representation, and are not extended to the consideration of matters inherent in the decision at which the Minister arrives. At the same time the division of the functions of inquiry and decision between the Committee and the Minister involve, under the present regulations, a certain hardship upon a respondent in that the inquiry represents to him the last and only occasion at which he can adduce sworn evidence of past good conduct in a professional respect, which evidence may have great weight in determining whether or not, for example, a single case of neglect or even conduct open to criticism would justify the extreme penalty of removal from the list of insurance doctors. We hardly doubt that the Minister would always be ready to receive reports of such good conduct, although not based upon sworn evidence, but the present regulations scarcely contemplate this course nor the difficulty raised in these cases of which the present one clearly exemplifies the problem here indicated. We desire, therefore, in addition to these observations, to draw attention to pages 52-63 inclusive of the shorthand note of the proceedings in case any amendment of the regulations may appear desirable.

"8. We are of opinion that the charge of gross negligence put forward in the representation fails. We cannot, however, hold that the complainants were not justified in all the circumstances in presenting their representation, and in this sense asking for an inquiry. And we think that the justice of the case will be met by our recommending that each party should bear their own costs of the inquiry."

#### *The Minister's Decision.*

The formal document conveying the Minister of Health's decision states that, having considered the report made by the Committee of Inquiry, the Minister has decided not to remove the practitioner's name from the medical list of the London Insurance Committee, and he directs further that no order be made as to the costs of the inquiry. A letter from the Ministry, addressed to the London Insurance Committee, contains the following paragraph:

"While the findings of the Inquiry Committee do not, in the Minister's opinion, justify the conclusion that Dr. Y's continuance on the medical list would be prejudicial to the efficiency of the medical service, he considers that the inferences of fact contained in paragraph 6 (ii) of the report indicate a failure to provide a proper standard of medical treatment, and he has accordingly decided that £10 must be withheld from the money payable to the Insurance Committee in respect of Medical Benefit. This sum should, in accordance with Article 36 of the Medical Benefit Regulations, be recovered from Dr. Y by deduction from his remuneration."

## Correspondence.

### *The Record Card.*

SIR,—The rural insurance practitioner, whose severe indictment of the present system of medical records is published in the SUPPLEMENT of February 14th, limits the possible solutions to two. Total abolition of records will never be granted by the powers that be, and many practitioners would be opposed to it. The impracticability of his other suggestion—that of the patient being made responsible for carrying with him his own record card—is sufficiently demonstrated by his own account of the failure of his multitudinous Samuel Halls to produce on demand the smaller-compacted medical card.

Before suggesting another solution, I would point out that the present record card serves two distinct and separate purposes—(1) a purely numerical record of all attendances, visits, etc., (2) a more or less scientific record of symptoms, etc. Presumably No. 2 is for the benefit of the patient, while No. 1 can be for statistical purposes only—that is, for the purposes of the State. Accurate recording of No. 1 under the present system involves the search for the card of each individual attended on any one day, for any and every ailment, however trifling.

The comparatively rare practitioner who prides himself on the accuracy of his day-by-day record-keeping must necessarily be devoting to the clerking process valuable time, which if spent in reading or recreation would be of real benefit to himself and his patients. Admittedly the statistical side of the card is neither of benefit nor of interest to doctor or patient, and I submit that statistics—at least equally and probably much more reliable—can be procured with a tithe of the expenditure of clerking time.

The first point is to separate the statistical from the clinical records. The clinical side will be considered later. The only statistical record required should be a day-by-day record of the total visits and surgery attendances for each day, and the entry of recurring attendances and visits on individual record cards should be abolished. For the purpose some such card as I enclose herewith would suffice.

The collection of these cards at the end of each year would furnish the Government with statistics of the actual work done by all panel practitioners, instead of the present method of rough-and-ready calculations from isolated samples.

The clinical record should be a separate document from the statistical, and should have a more convenient form than the present envelope. It would be an easy matter to devise one which could be inserted in these envelopes, and arrangements should be made for the possible duplication of such records as the practitioner may desire to retain for his personal use.

Obviously there would be no gain if a clinical entry were demanded for each interview with a patient; on the other hand, some definite minimum standard is necessary. I suggest that every case placed on certificate should have at least two entries—the dates of the first and final certificates (that is, duration of disability), and the diagnosis. Other details should be left to the discretion of the practitioner, and the futile entering of intermediate visits and certificates should be abandoned. The present time, when so many schemes for the benefit of the panel patient are in the air, seems opportune for urging on behalf of the panel doctor the adoption of any scheme which will retain the essentials and get rid of the time-fritting and temper-fraying facilities.—I am, etc.,

WM. CRAIG.

Bingley, Yorks.

\* The card enclosed by Dr. Craig is ruled on one side to provide spaces for a daily record of attendances and visits during one year. Twelve vertical columns, headed "Jan.," "Feb.," and so on, represent the months, and thirty-one horizontal columns the days of the month. Each of the main vertical columns is subdivided by a thin vertical line into two, headed respectively A and V, to denote the attendances and visits of each day. Space is provided at the bottom of the card for the total numbers of A's and V's in each month, and for the grand total of each for the year. On the back of the card are spaces for entering the doctor's name and address, the nature of his panel (main industry), and the number on his panel for each of the four quarters of the year.

SIR,—The heart of every doctor practising under the Insurance Act will go out to the West Country practitioner whose admirable, wise, and amusing note you published in the SUPPLEMENT of February 14th (p. 62). His experiences are those of all of us. If there is any sense of reality in Whitehall, this letter should send the existing Record Cards to the pulpers straight away.

The only practicable system of record-keeping by busy practitioners, each responsible for thousands of individual patients, is, as our West Country colleague suggests, by means of cards of which the patients themselves are the custodians. I and my partners are responsible for some ten thousand insured persons, and, in order to fulfil our legal obligations, we, with the help of secretaries, make the statutory entries on the official "F.M.R." forms. But we never refer to them, and I am sure that no official statisticians will ever refer to them. Quite independently of the official forms, we have our own record cards (of which I enclose a specimen), which we attach to the patient's medical card, to be produced by him whenever he visits us or we visit him. Additional cards are attached to the old one when necessary. We see at a glance the patient's history ever since he came under our care, with the various comments and opinions of each one of us. All

prescriptions are shown, and can be repeated or modified at need. By this means we are able to devote our time to the patient, instead of wasting three-quarters of it in groping through ten thousand official cards. This useless task we depute to secretaries, who copy on to them the necessary items from the patients' cards. We have worked this system since the Insurance Act came into operation, to our complete satisfaction. Our experience is that the patients never lose these cards, and always have them in their hands when they enter the consulting-room. A minor advantage is—or perhaps it is a major one—that, nothing being concealed, it promotes a candid relation between us and our patients. Personally, I never can understand how a large practice, especially if two or more men are working together, can be conducted otherwise.—I am, etc.,

London, E.1.

HARRY ROBERTS.

#### Insurance Remuneration.

SIR,—I have to thank the Scottish Medical Secretary for his explanation appended to my letter published in the SUPPLEMENT of February 28th (p. 81). If, however, lists are inflated to the extent of 12½ per cent. the situation becomes a very serious one for the practitioner. Only a trivial percentage of that inflation is due to persons who are dead; the remainder, who are "not entitled to medical benefit," are ignorant of that important fact, and we still continue to treat them apparently gratuitously. It seems scarcely just that, owing to faulty administration of approved societies or bad calculations by Government actuaries, the doctor should be penalized to the extent of at least 10 per cent. of his income.

It would be well that panel practitioners should know, and that those tendering evidence on their behalf to the Royal Commission should emphasize, that when a capitation fee of 9s is awarded, in reality it means a payment of about 8s. For obviously, as the Regulations stand at present, a practitioner is obliged to attend all persons who hold his panel card, although it transpires afterwards that the person "is not entitled to medical benefit." A partial solution of the problem would be that before any patient is removed from the doctor's list the society concerned must recall the medical card and notify the patient that he or she has now "ceased to be insured."

The fact I would most strongly emphasize is that panel practice does not mean either a fixed income or freedom from bad debts.—I am, etc.,

Govan, March 6th.

IAN D. GRANT.

\*\* We have referred this letter also to Dr. J. R. Drever, Scottish Medical Secretary, who writes:

If the writer had been following the published reports of the Insurance Acts Committee and the Conference, he would know that he is not posing a new problem. The defects of the present system are quite well known to all concerned, as is also the difficulty of finding a solution. His own "partial solution" would obviously increase, not diminish, the inflation. The important point is that, so far as can be ascertained, all the money which is due to the doctors is paid into the Central Pool and is all distributed to the doctors. If Dr. Grant will furnish specific instances of persons treated by him who are found to be not entitled to medical benefit he will be doing a useful service.

#### Maternity Benefit.

SIR,—In the revised draft Memorandum of Evidence to the Royal Commission on National Health Insurance is to be found a paragraph (No. 29) which sets out a scheme of maternity services. The precise implications of this paragraph are not very clear, and I should be glad if I might use your columns to seek further information on the point.

1. It is proposed to extend this service to, amongst others, the "wives of insured men." Does this mean all such wives or only those of the poorest? If it means (as it says) all of them, difficulties must arise in claiming that any of them should be excluded from other benefits now proposed to be given to some dependants. If it does not mean all, are we to infer that the institutional treatment, specialist advice, etc., proposed as "essential" to the scheme is such as the less poor will be able to provide for themselves? I must admit that I find it difficult to suppose that it would be possible to confine a full maternity service (including institutional treatment) to the wives of the less highly paid on the ground that those whose husbands had an income of £250 could afford it for themselves. In the same way it may be noted that a full service of consultants, etc., for services other than maternity would give much greater benefit than even the insurance and bank clerk can hope to provide for himself—and yet it is

suggested that the inauguration of a full service shall be signaled by the exclusion of these from benefit.

2. What exactly is meant by supervision during pregnancy? Does it entail advice as to morning sickness and such complications as pyelitis, etc.? There are two practitioners concerned—the insurance practitioner on whose list the patient is but who has declined maternity work, and the private practitioner whose name is on the list for maternity work only. It is commonly believed that pregnancy endures for some nine months. Do these two consult together throughout this period, and, if so, who gets the fee? I must admit that the idea of including supervision during pregnancy as part of the maternity service and then suggesting that the patient's ordinary medical attendant should contract out of maternity service at his own option seems to me calculated to cause the maximum of confusion with the minimum of gain.

3. What happens under this scheme to the theory that all practitioners collectively are responsible for all the insured persons collectively? If all the doctors in a country town contract out of giving maternity services (as they will do, by agreement, if they are wise), to whom are maternity cases to be allocated? This seems to me a very real difficulty and quite sufficient to wreck the proposed scheme. Was this difficulty ever placed before those meetings of the profession which have accepted the scheme?

4. Complaints are to be referred to a purely professional committee. That sounds right enough; but by what process of logic or otherwise is this to be recommended to a lay commission which is at the same time to be told that the existing procedure, with certain modifications, will suffice very well for all other complaints? Are not complicated scientific questions involved in both cases? If I were a layman, I think I should draw the conclusion that the doctors' midwifery work was so bad that they were afraid of its investigation by anyone but themselves. I might draw the further conclusion that they meant to hush up complaints on this score—and I should be at least as well justified as anyone who chose to draw any different conclusion.

5. The whole scheme is conditional on certain "essential" auxiliary services. One of these is the provision of institutional treatment for those whose homes are very unsuitable for maternity work. It has yet to be proved that maternal sepsis is any more frequent in dirty homes than in clean; but apart from that, and apart also from the fact that the worst homes are often those of the most highly paid manual labourers, I would ask whether it is at all possible that such provision can be made for many years or as part of any insurance scheme. The answer seems to me to be in the negative, and I am frankly very doubtful whether it is wise to speak to a Royal Commission on National Health Insurance of any scheme which is conditional on something not likely to occur for many years, and even then not likely to be under the control of any insurance authority.

6. I would further like to ask, Why is this or any scheme put forward in place of existing arrangements? Those who have advocated the inclusion of maternity services before the Royal Commission have had only two arguments. These are literally and fully as follows: (a) That they do not see why it should not be included; and (b) that the whole of the existing cash maternity benefit is swallowed up by doctor's fees, which have risen directly in proportion to the amount of this cash benefit. The second is the real point, but it is absolutely buried by the revised draft Memorandum. But it will not be so easy to burke it in cross-examination, and one would like to feel sure that the British Medical Association has figures in reserve to refute this accusation. I am not aware that any wife of any insured person is now without the aid of a doctor during her confinement if his services are needed, and I am still looking for any adequate reason for the vast dislocation of existing health services and the excessive inconvenience to doctors which this scheme must so surely bring in its train.

7. Finally, I crave permission to make one remark of a general character. No fair-minded person can deny, I think, that some, if not all, of the points which I have made are not without sufficient importance to sway the views of a meeting called to consider the scheme; an explanation in one direction might sway the meeting to accept the scheme, while an explanation in another sense might lead them to reject it altogether. I suggest that meetings before which these points have not been discussed were necessarily so far unaware of the meaning of paragraph 29 that any assent they may have given can be considered of but little value.

Unfortunately much the same is true of very many other paragraphs in the Memorandum. We have been asked to vote for hands of which we have only seen a few cards, and our votes are useless as expressions of professional opinion. The other cards (if ever we are allowed a sight of them) may entirely alter our views. It is extremely unfortunate that there is scarcely a single firm recommendation in the whole

Memorandum. It cannot be by accident that one may read into almost every paragraph exactly what meaning one wishes. I take it that this is the practical working of the theory that there is some essential difference between evidence and policy. I think it is mistaken, and that, having asked for a Royal Commission, we should at least go before it with something definite to urge. There is still time to do so.—I am, etc.,  
Sevenoaks, March 1st.  
GORDON WARD.

## Naval and Military Appointments.

### ROYAL NAVAL MEDICAL SERVICE.

SURGEON COMMANDERS W. K. D. BRYTON to the Pembroke for R.N. Barracks, Chatham, and as specialist in Ophthalmology; R. Willan to the *Agamemnon*; C. J. O'Connell to the Victory for Portsmouth Dockyard; A. R. Davidson to the *Tiger*.  
SURGEON LIEUTENANT H. E. M. MARTIN to the *Clematis*.  
MR. E. R. SORLEY has entered as Surgeon Lieutenant for short service, and appointed to R.N. Hospital, Haslar, for course.  
To be Surgeon Lieutenants: R. M. L. Still, W. H. Bradfield.

## THE FUTURE OF NATIONAL HEALTH INSURANCE.

### JOINT MEETING OF MEMBERS OF THE REPRESENTATIVE BODY AND OF THE PANEL CONFERENCE.

#### THE EVIDENCE TO BE TENDERED TO THE ROYAL COMMISSION.

THE joint Conference of members of the Representative Body of the British Medical Association, of the Conference of Local Medical and Panel Committees, and of the Royal Commission Committee of the Association, was held at the Central Hall, Westminster, on March 12th. It was called on the requisition of the Council to consider the Memorandum of Evidence proposed to be submitted to the Royal Commission on National Health Insurance. The revised draft of the Memorandum appeared in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of February 28th, 1925 (pp. 69-78).

The attendance was very large, not many short of 300 being present, and the discussions were well sustained throughout. Although almost half of those attending represented Divisions of the Association, and almost half represented Local Medical and Panel Committees, the distinction between the two kinds of constituencies was not apparent in the assembly itself, the members sitting and voting as one body.

Those on the platform were: Dr. H. B. Brackenbury (Chairman of Representative Meetings), Dr. R. A. Bolam (Chairman of Council), Dr. E. Kaye Le Fleming (Chairman of the Conference of Local Medical and Panel Committees), Dr. H. G. Dain (Chairman of Insurance Acts Committee), Mr. N. Bishop Harman (Treasurer of the Association), Dr. Alfred Cox (Medical Secretary), Dr. G. C. Anderson (Deputy Medical Secretary), and Mr. W. E. Hempson (Solicitor).

Dr. LE FLEMING proposed that Dr. Bolam take the chair, and this was seconded by Dr. D. F. Todd and carried unanimously.

Dr. BOLAM, on taking the chair, said that as Chairman of the Committee which had been gathering material for the evidence it was probably his duty to place the matter of the Memorandum before the conference, but Dr. Brackenbury was more familiar with the whole subject, and

the advantage of the arrangement now adopted was that Dr. Brackenbury, otherwise the most fitting person to preside, would be free to place the document before the Conference, to take part in the debate, and to answer questions. He hoped that, as the Memorandum had now been before the profession for a considerable time, minor matters of criticism would be left alone, and the Conference would address itself to the main issues.

It was agreed, on a proposal from the chair, to receive the revised draft Memorandum as published in the SUPPLEMENT of February 28th.

#### DR. BRACKENBURY'S PRELIMINARY STATEMENT.

Dr. BRACKENBURY then asked the Conference to approve the Memorandum. He believed the present meeting to be unique in the history of the medical profession. It was to a large extent informal, but he hoped it represented professional opinion of all kinds, both within and without the British Medical Association, and within and without insurance practice. The Council of the Association took responsibility for the Memorandum. It was the Council which would decide who should be the witnesses, and it wanted to be able to tell the Royal Commission that the opinion of the whole profession, so far as that opinion could be expressed by any small body of persons, was behind this evidence. In formulating the proposed evidence, the Council had appointed a special committee, distinct from but associated with the Insurance Acts Committee. The Insurance Acts Committee itself was not entirely composed of insurance practitioners, and the special committee included a number of persons who had not been accustomed to take any part in the official business of the Association, but who, because of their eminence and knowledge in certain particular respects, or because of their representative capacity, were likely to help very greatly in the matter of drafting and in giving a proper balance to the document. The Council, having itself reviewed the first draft formulated by these committees, sent it down for consideration by meetings of the profession throughout the country, held under the joint auspices of the Divisions of the Association and the Local

Medical and Panel Committees. The reports of these local meetings were very valuable, though he asked the Conference not to attach too much importance to mere numbers in voting one way or the other, seeing that the meetings represented entirely different kinds of constituencies, and carried resolutions by various majorities. But the general body of opinion was fairly evident, and in view of it the Council again revised the Memorandum, altered it in certain particulars, varied its emphasis a good deal in places, and again submitted it to local meetings for their consideration. This Memorandum of Evidence was now before the Conference, and the opinion of the Conference would come before the Council at a meeting to be held shortly. It did not follow that any resolution carried by the Conference would necessarily be adopted by the Council, but when he said that the Council would give full weight to expressions of opinion from that conference the difference was not great. Technically this was a Memorandum of the Council of the British Medical Association, which the Council would revise in the light of these expressions of opinion. All that was now under consideration was the statement which it was desirable to put before the Royal Commission. It did not follow that the profession would get what it asked for in that statement, nor should it be influenced by the feeling that it would not be likely to get what it asked for. It might be considered that some of the proposals in the Memorandum were impracticable for financial or administrative reasons. All that was said was that if the proposals could be carried out financially and administratively, those were the kind of proposals which ought to be furthered in the interests of the national health and of the profession. This was an opportunity for the profession to make public what it believed to be the right lines on which a national health insurance scheme should go forward. It was merely an outline of evidence. Too much importance should not be attached to particular details, and no one should be unduly anxious because certain things were not amplified in the Memorandum in the way in which he or his constituency might desire. The Memorandum must be taken as a whole; a sense of proportion must be preserved in reviewing its different parts; and the emphasis and amplification must be entrusted very much to those who went before the Commission, sat in the witness chair, and answered the questions of members of the Commission. The witnesses would be bound by the Memorandum. It would not be open to them to give evidence conflicting with the opinions expressed in the Memorandum. But there might be all sorts of things in a detailed way which they would have to go into and explain, and which need not be explained in the printed document. If the way in which the Memorandum had been compiled was borne in mind it would be seen that it was not worth while to devote much attention in the Conference to verbal changes, knowing that such amendments as were necessary in these respects would be dealt with by the Council or by those who acted on its behalf. He did not know whether the meeting would wish to take the Memorandum paragraph by paragraph, or whether it would be desirable to direct attention to the amendments, or to those parts of the Memorandum which were the subject of amendments of which notice had been given.

The CHAIRMAN thought it would be convenient to assume that where no amendment had been handed in the meeting was of opinion that the draft evidence did not need revision, and that the draft should be taken page by page until the first amendment was reached. The first part of the Memorandum set out the place of the Association in coming forward to give evidence, and the steps which had been taken to assure that evidence being, so far as possible, representative of the feelings of the profession, so he would take it that the meeting approved Part I without comment. (Agreed.)

Dr. DAIN suggested that, with a view to focusing the attention of the meeting on what he was sure would be regarded as seriously important things, the large principles raised should be dealt with before matters of detail. ("Hear, hear.") He would therefore suggest that the question of inclusion of dependants, the inclusion of Poor Law cases, and the position of the maternity service, should be

taken in that order before the detailed amendments. He would like to suggest that the question of the inclusion of dependants on Mr. E. B. Turner's amendment should be taken as the first business. Dr. LE FLEMING supported that method, and it was agreed to.

Dr. F. RADCLIFFE rose on a point of order. There were a number of representatives, he said, who were representatives of Divisions, and a number who were representatives of Local Medical and Panel Committees, each of whom was entitled to one vote. There were also a number of men representing both Divisions and Local Medical and Panel Committees. Should these have one vote or two?

The CHAIRMAN said he hoped that point would not arise. He thought the principle of "one man, one vote" in a meeting of that kind was an excellent principle. He trusted the Chairman would not be pushed to the extremity of counting the number of constituents represented by particular individuals.

Dr. TODD asked what standing orders would govern the conduct of the meeting.

The CHAIRMAN replied that the meeting was under the standing orders of the Chairman. (Laughter.) He proposed to be guided in the main by the standing orders of the Representative Body and of the Local Medical and Panel Conference, which were almost identical.

#### THE INCLUSION OF DEPENDANTS.

Dr. BRACKENBURY, in introducing the question of dependants, said that this really arose on Section A of the Memorandum, paragraphs 10 to 18. It was perfectly true that that section did contain something besides the question of the inclusion of dependants. It included the question whether everybody who was at present under the Act ought to remain in insurance, and the question of dependants could scarcely be separated from that aspect of the matter, because it seemed obvious that if certain persons who were at present included were ruled out, the dependants of those persons at all events would not be included. Therefore several points were made in the section. First of all, it was said that there were a good many people under the Act at present who did not need, for economic reasons, to be under the Act at all, and that certain classes of those persons and certain individuals among them ought to be excluded from the insurance scheme; it should be remembered that the first proposal under that section was that the personnel of those who were at present included should be reduced by the application of the first general principle—namely, that only those persons should be included who could not provide for themselves. He did not think that there would be much difference of opinion about that. Then the question of the inclusion of dependants was dealt with, and it was said in the Memorandum that it would be a contravention of the first principle if the proposal was adopted which had been made, that all the dependants of insured persons as at present defined should be included. There was a certain body of opinion in the profession which was in favour of that; but the Council was proposing to give evidence against it. They were not in favour of including all the dependants of all insured persons as at present defined. They stated in those paragraphs that that would be to make the contravention of the first principle worse; it would not merely be retaining persons under the Insurance Act who need not be under it, but it would be including other persons, fresh persons, under the insurance system who need not be under it. So the Council held that the first principle ought to be applied as far as was administratively possible: that only those persons should be included who could not make provision for themselves or for whom provision could not be made outside the insurance scheme; and that, in the opinion of the Council, and apparently in the opinion of the profession, carried with it the corollary that the scheme must include the dependants of persons who were themselves rightly included. The Council was therefore proposing to put up, as practicable or otherwise, to be adopted or perhaps to be turned down, but as being the right thing for the Association to suggest, that the lower paid among the existing insured persons should alone be included, and that any extension to dependants should be only to the dependants of those lower paid persons; that in the interests

of national health it was as important to make public provision under the insurance scheme for the dependants of the person who could not make provision for himself as it was to make provision for that person. That could not be escaped on the logical ground of the application of the first principle; nor could they get away from it on another ground which was put forward in the paragraphs to which he had referred, that the State must interest itself in the health of the poorly paid persons and their dependants, and that if it did not make provision for them in one way, it was certain that it would make provision for them in another. So great an advance had been made in the social economy of this country that the State was not going to allow any considerable section of the population to go under in the matter of health without making some provision for them, and the tendency at the present time was to make provision of a very limited and unsatisfactory character—good as it was as far as it went—by way of municipal clinics and treatment centres, worked, very largely, by whole-time officers. The Council believed, and apparently the profession believed, that in putting forward those paragraphs they made it clearer than it was in the first draft that they believed the method of private practice, or a method approximating to private practice, was both better for the national health and more consistent with the interests of the profession than was the method of providing treatment clinics worked by whole-time officers. They were faced with two things in accordance with their principle—(1) that only those persons should be provided for who could not provide for themselves, but that (2) all those persons should be provided for who could not provide for themselves. They must include the dependants of the lower paid persons, and if they had to choose between alternative methods of making provision for those persons, they believed the method of private practice and the family doctor was the method they should put forward in evidence as being the right method by which the State should see that those persons were provided for. ("Hear, hear.") That was the gist of the paragraphs so far as that principle was concerned. The proposal had been through the mill; they had discussed it over and over again in Council, and in meetings throughout the country; and he would therefore ask the Conference very earnestly indeed to authorize the Council to go forward on those lines. (Applause.)

Mr. E. B. TURNER, speaking as representative of the Kensington Division and, he said, of practically all the non-insurance general practitioners in the kingdom, moved:

That this Conference, while in favour of the provision of a complete and properly extended medical service for those at present insured, is not at the moment, for various good reasons, in favour of the extension of that service to any of the dependants of such persons, and therefore desires the Memorandum of Evidence to be amended accordingly.

Mr. Turner said he had good reasons to put forward why the recommendation that dependants should be included should not go forward in the evidence of the Association. If that evidence was given on behalf of the Association, if the Royal Commission accepted it, if it came before Parliament and Parliament granted it, there would at once be an absolute line of demarcation between two portions of the profession—a line that would never afterwards be bridged. He had heard a great number of gentlemen who were working under the Insurance Acts urge that although they were insurance practitioners they were private practitioners as well. If dependants were put in, even to such an extent as to bring up the total number of insured persons to 30,000,000—the smaller number—there would be a certain number of men in rural districts and in residential districts who would still have a certain amount of private practice; but in the densely populated industrial districts in the Midlands and in the East End of London there would not be "one rag" of private practice left. The whole of the work of practitioners in those districts would be contract work, panel work, and they would be cut off from the rest of the profession. That, to his mind, was disastrous and most repellent, for he thought it would be bad in the eyes of the profession, and even worse in the eyes of the public.

Furthermore, the Memorandum went against including the whole of the dependants, and recommended the inclusion only of a certain number; and an attempt was made to get that certain number fixed by various safeguards, which were set out in paragraphs 14 and 15 of the Memorandum. Practically the whole thing hinged on income limit. The Memorandum suggested, first of all, that the number of the present-day insured persons should be cut down by fixing an income limit to cut out the highly paid manual workers. If anyone thought for one moment that that recommendation would be accepted, then he did not think much of his intelligence. ("Hear, hear.") The speaker had had to fight that question when the insurance scheme first came on with the then Chancellor of the Exchequer. Everyone knew that no Royal Commission, especially one constituted as the present one was constituted, would dare to recommend that an income limit should be put on, cutting off a large number of the better paid workers. No Government would dare to bring it forward; they would not jeopardize the votes of potential millions to satisfy a possible 10,000 or 15,000 men. Even if there were an income limit below which the dependants should be taken in, it was a practical administrative impossibility to fix it. How could the border-line man be dealt with—the man whose income was so much one week and so much another week? It would necessitate a continual inquiry as to what the man's income was, and whether it was above or below the line. That would mean an enormous increase of officials and of expense, and it would be eminently unsatisfactory in every way, to say nothing of the fact that no Government would dare to face it. If the Council of the British Medical Association went forward, speaking on behalf of the profession, or of a considerable body of the profession, and said it was ready to take on two-thirds, then the Commission, if it was going to make any recommendation at all with regard to the inclusion of dependants, would recommend that everyone should be put in. That might be taken as a certainty; the Commission would not recommend that a portion of the dependants only should be included. The proposal to include dependants gave a distinct lead to those who wished for a whole-time salaried service. He joined issue with those who said that by taking those persons in a better attendance would be provided. He thought the amount of work that would be entailed upon the men who undertook the treatment of the women and children would be such that they would not have the time to give as much real attendance as they ought to. He did not know what the figures were in the industrial practice, but in his own sheltered practice he saw twenty-five women and children to one man. Among workmen it was different; the professional and leisured classes were not so liable to illness; but even if one saw five times more women and children than men, what would that mean in an insurance practice? The practitioner would have no peace at all. They were asked to take on, in addition to their working-men panels, these women and children, the very people who would rightly require much more attention than they got at present. It was said that these people could not afford to pay anything for themselves, but he had asked the Council to say whether it was not a fact that they would have to pay, and the Council had replied that it would probably be by an increase of the premium paid by the breadwinner. That meant that these families would have to spend money—there were no employers to make a contribution—and the State would have to spend money. If dependants were compulsorily insured, and if the meeting voted for it, and the Council put it up, and it was carried, they were voting for a legal and compulsory removal of a large number of patients from the private practices of their non-panel brethren, to be transferred to the panel lists. This would mean that the division in the profession would be accentuated, and the feeling would become exceedingly bitter. Dr. Brackenbury had spoken of the Government doing something for the dependants if the Association did not say it would take them on, and had hinted that the maternity and child welfare clinics and school clinics would be extended. He quite agreed with the objection to that. There was nobody who believed more strongly than himself that the work should be done by general practitioners, and that the work

done by whole-time officers in clinics should be reduced to a minimum; but among the safeguards in paragraph 17 was a recommendation that in suitable populous areas infant welfare centres should be continued, provided that the practitioners had reasonable access to the records of cases under their care. He knew a good deal about the maternity and child welfare centres, as he was on the executive committees of two of the bodies that worked them, and he had had a very hard task in keeping up the end of the Association when speaking at meetings of those bodies; yet the continuance of those centres was put forward as one of the reasons for asking the representatives to vote for the inclusion of dependants. The Association had a big opportunity before it to improve the insurance service, to let the service be such as the insured persons might expect, and had a right to expect, and at the same time to bring home to the Commission the necessity that, if such a service was desired, the red tape, the iniquitous conditions, the £1,000 fine, and all that sort of thing, which so oppressed the practitioner at present, must be removed. If the Association took that line it would do infinitely more good to the profession, to the public, and to the sick people, than if it followed an illusory will-o'-the-wisp of nationalization of two-thirds of the population and 15,000 of the profession. (Applause.)

Dr. J. STEVENS (Edinburgh) supported Mr. Turner's amendment. When the wage limit for manual workers was discussed in the original Insurance Act there was nothing the profession was told more definitely than that they would not get a wage limit. The proposal was impracticable, and it would injure the prestige of the Association if impracticable proposals were put forward. Even if only a proportion of the dependants were proposed to be included, the result would be that, as there would be no clear dividing line, the whole of them would be sooner or later included. Dr. Brackenbury had said that they ought to ask for what they wanted, whether they thought they would get it or not. But if they asked for what they could not get, that was the very way to get what they did not want. (Laughter.) State provision should be made only for those who were necessitous, and those who needed it should be left to come forward and say they could not provide for themselves. That would leave all the others, all except perhaps four or five million, to look after themselves, and they would look after themselves as regards their health far better than the State would ever do it for them. If a strict line of principle were drawn in that way there would be unity in the profession, because the non-insurance practitioners who had stood out against the Insurance Act would agree to provide for the necessitous, and for them only.

Dr. C. H. PARRING (Insurance Acts Committee) said it was lamentable that speeches should be made like those to which the Conference had just listened. It reminded him of the old days, before the Insurance Acts came in. There was only one thing that could be said for those speakers: they were perfectly consistent; they were up against every extension of national health insurance. But those who had had ten years' experience of the Insurance Act were not going to endorse the words of the "die-hards." Everyone who had worked the Act—and it was endorsed by everybody who went before the Commission—acknowledged that the bulk of the work of the insurance practitioners had been done thoroughly well, and that it was improving year by year as the old prejudice died out. Most of the bad work had been due to prejudice, and all the young men who were coming into practice at present were working their insurance practices in a way which those who watched it were proud of. If the profession set out to oppose the inclusion of dependants they would be in a hopeless position, because it was already said in the draft Memorandum, and everybody admitted, that it had been a good thing for the population as a whole; and everyone who had worked conscientiously in an industrial area knew that the people were getting better attention; the people were coming for the treatment of their small ailments, which was desirable so as to get as near preventive treatment as possible. Patients who came readily were less likely to come with bad illnesses; and the insurance societies acknowledged the fact that it was due to the working of the Insurance Acts that their sickness benefits were going down. It was

admitted that the panel scheme had been a good thing for the 14,000,000 already under it: would not it be better still to get some of the rest of the population treated properly? It stood to reason that if one section benefited the others must. Some people said that there was no need for the dependants to come in, because the poor people got attention provided. But did they? He had had twelve months' experience of a public medical service, and he was speaking from practical experience, not theory. His experience had shown him the tremendous number of the population who were not getting any treatment. ("Hear, hear.") In an ordinary working-class family the man took his beer money and his tobacco money, gave what was over to his wife, and she did all the rest: she even paid his club subscriptions. She provided everything for her husband and for her children, but she did not provide for herself. She could not pay two shillings or half a crown to go and see a doctor and get his advice and a bottle of medicine. He had not found insurance patients and their dependants any more unreasonable than private patients, so that he was not afraid that the new work could not be done. Another thing was that the Government was going to provide these people with treatment; and the question for the ordinary practitioners was whether they preferred that these people should go to the clinics, which had already taken away a good deal of work, or whether they would suggest some other way of dealing with them. They would have only themselves to blame if the Government provided treatment through the clinics. If the Association was prepared to do its share, it had a very strong argument in favour of cutting the clinics off. The only alternative to the co-operation of the Association was the whole-time salaried officer.

Dr. C. E. S. FLEMMING (Salisbury, Swindon, and Trowbridge Divisions) said that according to Mr. Turner's argument, if the scheme was carried through, practically every practitioner would have to become an insurance practitioner, practically the whole population would become insured, and the difference between the insurance practitioner and the non-insurance practitioner would be accentuated. But in the part of the country where he lived they were practically all insurance practitioners, and he had not seen that difference between the men in the town who were consultants and others, in perhaps the larger towns, who were not insurance practitioners. He believed that was one of the bogies that had been set up to frighten them. Mr. Turner had also said that it would mean the taking away of a large number of patients from the non-insurance practitioners; but how many dependants of insured persons were attended by non-insurance practitioners? He could not believe that it was really a large number. ("Hear, hear.") From his own experience he felt sure it was a very small number; and even if that were not so, the class of persons to whom Mr. Turner had referred as not being able to pay, or grudging the payment of the small extra premium required for their insurance, were not remunerative. Most people would admit that at present the dependants of insured persons were not receiving adequate treatment. Mr. Turner must admit it, because he had said that if they were included it would not be possible to give the attendance they would require. The attendance they required was only the attendance they ought to have. On the question of the income limit, Dr. Flemming did not think that was absolutely impossible. It was a difficult question, but at the present time it was carried out in hospitals; it was carried out by local authorities in requiring repayment of fees for attendance in midwifery or treatment of school children, and so on. He did hope that the representatives would remember the words of the Chairman of the Representative Meeting with regard to the work being done by the clinics. It was absolutely essential that practitioners should take their part; otherwise the Government would be compelled to increase the work of the clinics. There were not only the school clinics, where perhaps half a million children a year were attended, but there were also maternity and child welfare, tuberculosis, venereal disease centres, and there was now a proposal to include rheumatism and heart disease, and a long list of diseases, which really meant half the work of the general practitioner. The Association had its chance

now to take a part in the preventive side of medicine, which was of increasing importance every day. (Applause.)

Dr. W. MERV SMITH (Eastbourne Division) said the scheme of proposals embodied in the Memorandum was ideal from a national health point of view; they might even be regarded as a compendium of the collective wisdom of the personnel representative of the various sections of the medical profession included in the composition of the Royal Commission Committee. But, having regard to the arbitrary injunctions, the punitive menaces, and the unreasonable restrictions imposed upon the liberty and the judgement of the practitioner in his terms of service agreement, the offering of the Memorandum at the present juncture would constitute a violation of the conscientious opinion of the insurance practitioners' twelve years' experience of the National Health Insurance medical service. It would be derogatory to the dignity, subversive of the independence, and sacrilegious to the traditions of the profession. What guarantee had they that, should the scheme be accepted and recommended by the Royal Commission, and finally implemented by Parliament in a consolidated Act, those pernicious influences and factors would be eliminated? That ought to be the first consideration of the Conference. Moreover, was it likely, with all due respect to the inestimable services which the Insurance Acts Committee had rendered to insurance practitioners, that in future the Committee would succeed where it had failed in the past? In those circumstances he asked the meeting to take into consideration the various questions arising out of the fundamentals of the Memorandum; and should the verdict of the meeting be in favour of its adoption and presentation, it would carry with it all the elements, potentially, of intercollegiate strife in the ranks of the Association.

Dr. G. W. R. SKENE (Willesden Division) spoke in favour of Mr. Turner's amendment. He was not a "die-hard." He opposed the Insurance Act when it was first introduced. He was not working it, and his intention was never to touch it. But his antagonism to the Act and its working did not debar him from looking at things from a reasonable point of view. (Laughter.) In the few years of smooth working of the Act matters had not yet settled down, and therefore it was not the time to talk about extending its benefits and increasing patients from 15 to over 30 million. His practice was in the slightly better part of an industrial district, and 90 per cent. of the people came under the Act. The majority of the male persons and the workers who went to him were entitled to insurance benefits, but preferred to go to him, for reasons that they themselves knew. (Laughter.) Their dependants also went to him. It was true, of course, that a considerable number of the workers went to their insurance practitioner, but even where the workers went to their insurance practitioner the dependants went to him (the speaker), and probably his experience was not unique. Among the people who were having benefits under the Act there was a considerable amount of dissatisfaction with the treatment they received, because it was not sufficient. The scheme was but a patchwork affair, dealing only with certain kinds of diseases. If the time had come for any extension at all, it was to make the Act a thoroughgoing thing from a medical point of view and to extend the benefits now given to the present insured persons. When they had a scheme which the people would appreciate, taking in all their complaints, rendering specialist, dental, and other services, it would be time to talk about extending it to dependants. There were many difficulties in the way of doing that at present. He was suggesting that for the honour and good name of the profession they should take on a small piece of work and do it thoroughly, and not, by attempting too much, spoil the whole thing.

Dr. C. SANDERS (Stratford Division) said that the previous speaker declared he would have nothing whatever to do with the National Health Insurance scheme, and used that as an argument for voting for the amendment. The man sitting on the five-barred gate knew better how to get the hay up than the man with the rake in the field! He (the speaker) was not a private practitioner, he was not in contract practice, and he was not now a whole-time official, but had had considerable acquaintance with all those pieces

of practical work during his long experience. He pressed two points. First, the Memorandum had gone through the length and breadth of the land, meetings had been held in all constituencies, and the Council of the British Medical Association was in possession of the results. The majority of the profession throughout the country had supported the proposals outlined by Dr. Brackenbury. In the second place, they should not be frightened by the bogey set up by Mr. Turner, that the result of voting as the Council desired would take away the practice of the private practitioner. Mr. Turner was a very able debater, but his experience, he suggested, was almost entirely confined to the West End of London; yet he took upon himself to decide what would happen in industrial areas and in the East End. For forty years the speaker had lived in the East End, and knew more about it than Mr. Turner.

Dr. F. REES (South Essex Division) said they had reached a very important crisis. They had to consider, not only their personal interests, but the good of the profession and those who would come after them. He could not but admire the consistency of men like Mr. Turner, who had opposed the Insurance Act from the beginning, and was against anything savouring at all of a national health service. But the country was now living under a National Health Insurance service, and, once started, it was inevitable that it must progress. Either they should not have touched it, or they should intend to make it as fine a service as was possible. They could not go back. It was not the profession that was insisting on taking in dependants of insured persons, it was the public. If they refused to extend the benefits of the excellent medical service to any other portion of the population, he did not believe they would have the country behind them. But they ought to take the opportunity of trying to mitigate the evils inherent in a State national service—the autocratic, bureaucratic system. He believed they could do it. The Council in the Memorandum called attention to the autocratic position of the Minister of Health, who could wipe men off the panel and had the final authority. The Council pleaded that the doctor taken off the panel should have the protection of the common law. If they adopted the Insurance Acts Committee's plan with regard to the governing of the service—that the governing body of the National Health Insurance service should consist of equal numbers of the members of the Insurance Acts Committee, of the insured persons' representatives, and representatives of the general public, and that the Minister of Health should only act in the capacity of chairman—he believed that would be the best system for them to work under. With regard to regional medical officers, he saw no reason why these offices should provide a large amount of additional patronage for any Minister of Health. The regional medical officers ought to be elected by the men in the region. ("No.")

Dr. A. G. NEWELL (North Middlesex) said that as an insurance practitioner he had no objection to the proposal to increase and perfect the system of National Health Insurance. But their prime duty was to perfect the existing system, to remove all the difficulties, and to give every insured person equal and extended benefits. He did not think the time was ripe for the inclusion of dependants. The economic condition of industry, of the workers, and of the country generally would not stand so heavy a cost, and he doubted the wisdom of putting before the Royal Commission a proposal of such far-reaching importance. It was proposed that the dependants, their wives, and their children should all be taken in free, without contributions, because a large proportion of the workers could not give contributions, and therefore the cost of the treatment of wives and children should be State-borne. That was asking for a State medical service. They practically had no answer to the Government if it said, "We will extend this into a full State medical service." It was not true that at present there was no provision for dependants and children. In certain areas—Southampton and Essex—there was a medical service for dependants. He believed in Essex adults paid 4d. a week, married couples 6d., and for each child, up to three children, 3d. each was paid. At that rate 400 families would give a doctor £1,000 a year. Treatment at clinics was abused by a large number of people who could afford to

## Evidence to the Royal Commission:

pay. They were told in paragraph 5 of the Memorandum that only during the last three years the National Health Insurance scheme had been working smoothly, and yet they were asked to go further into a wide field of treatment for dependants on that short experience.

Dr. TWISS (Devonshire) asked whether there were any documents to show the answers of Divisions, or of the meetings that were held in the Divisions, to the question whether they preferred the extension of specialist services or the inclusion of dependants. The CHAIRMAN said that strictly the point was not relevant, but the information was available when the question of the relative order of services was considered. Dr. FOTHERGILL (Brighton) said that though the Council might have the figures, everybody had not. The CHAIRMAN thought the question was really irrelevant to the particular matter at issue; the figures, however, could be given.

The MEDICAL SECRETARY then read the following question which had been put at local meetings:

"If financial or other circumstances should make it impossible at the same time to insure dependants and also to extend the medical provision for insured persons to include specialist and consultant services, which would the meeting put first: (a) the extension of the provision made for the present insured persons so as to include specialist and consultant services; or (b) the inclusion of dependants?"

The returns showed that 130 favoured the provision of consultant services first, and 60 areas wanted the inclusion of dependants first.

Dr. F. RADCLIFFE (Oldham Division) said he did not want to repeat points that had been raised by Mr. Turner, but he was instructed by his Division to bring forward some other points. If the dependants, whether the whole of them or only the poorer paid, were included under the Insurance Acts, it would make it grossly inequitable as between area and area, because in certain industrial areas the percentage of the population which was insured was very much greater than in other areas. In the textile areas of Lancashire there was a large proportion of female labour; so the whole of those women would have to contribute for the dependants they could never have. (Laughter.) Immediately they became married the children would be dependent on the husbands, so they would be paid for twice over—by their mothers when they were single—(laughter)—or rather their potential mothers before they were married—and later by their fathers. That was grossly unfair.

Dr. H. J. CARDALE (London Panel Committee) said it was a pleasure to meet some of the old "dic-hards" again, whom he thought he should never have seen again except possibly in a museum. (Laughter.) It was also a pleasure to have heard again the word "derogatory," which he had almost forgotten how to spell. (Laughter.) The serious business before the meeting was to decide whether there was any necessity from the point of view of public health for the inclusion of any class of dependants. He did not believe there was a man who had practised in an industrial area who would not say that there was a crying necessity for the inclusion of the dependants of the lower paid workers. ("Hear, hear.") Mr. Turner had suggested that they should go on getting the private treatment of the general practitioner—which they did not get; Mr. Turner suggested no alternative. He (Dr. Cardale) had not heard a word of any constructive proposal put up at all. It seemed to him there were only two ways open: one was to have the people attended under the Insurance Act, and the other was to have them attended under a State medical service. He did not agree that the Council's proposal would lead to a line of demarcation in the profession; he thought it would rather tend to wipe it away.

Dr. J. HOLMES (Bury Panel Committee) said there were three reasons, to his mind, why the draft evidence could not be accepted. It was impossible to decide who were and who were not the lower paid workers. They did not want an extension of the Act to anybody so long as the list of those who were insured was not acceptable. They did not want any extension of work until the conditions under which they did the work were satisfactory to the practitioners. Their attention should be turned to improving the conditions before extending the work.

Mr. H. CAIRNS (Sheffield Division) said that his instructions were to vote against the inclusion of dependants; but he and his co-representative, Dr. Forbes, had a free hand to vote according to the arguments put before the meeting. After hearing the speeches of Mr. Turner and the others in favour of excluding the dependants, he felt that he must vote in favour of their inclusion. (Laughter.) He thought that to refrain from doing something which was worth doing because there was a certain amount of difficulty had a spice of cowardice about it.

Dr. W. I. GORDON (Northumberland Panel Committee), in opposing the proposal of the poorly paid worker was very different from his. Dr. BRACKENBURY interposed to say he had given no definition. Dr. GORDON said that was so—(laughter)—but that was the point he wanted made clear. At present, with half their practice of a private nature, the practitioners had some freedom; but if practically the whole of their practice was panel practice the independence of the profession would be ground them down to 4s. a head.

Dr. J. P. WILLIAMS-FREEMAN (Insurance Acts Committee) said he wished to put the rural aspect of the matter before the meeting. He had heard a great deal from other rural practitioners, and his impression was that on the whole they wished to have the dependants included. There were a great number of dependants in the country who suffered because the doctor was not sent for owing to the inability of the family to pay him. Those were the people who ought to be catered for. It would add to the work, of course; it would add a certain amount of frivolous work, and that kind of thing would have to be guarded against; but it would add also to the necessary work, the proper work, and practitioners would have to adapt themselves to that. That class of work would not absorb the whole of the practice. There would be a fair number of private patients left in the villages and in the agricultural districts. The proposal would bring in for some sort of payment a very large number of dependants of the agricultural labourers for whom at present the practitioner received little or nothing. Then undoubtedly rural practitioners were being threatened, not as much as the town practitioners, but to some extent, by having their proper legitimate family doctor work taken out of their hands into the clinics; and for that reason alone he would be in favour of including the dependants. He believed that the clinic was the thin end of the wedge of a State-salaried service; though he was thankful to believe that such a service in rural districts was practically impossible.

Dr. A. E. LARKIN (Hastings Panel Committee) deprecated the insinuation that had been made that the proposal of the Council was only opposed by non-insurance practitioners. Not half the men were on the panel, and the proposal meant that the panel men were going to "sneak and collar" the patients of the non-panel practitioners. ("No, no.") Perhaps he ought not to say "sneak and collar"; but he wanted to avoid the imputation of such "sneaking and collaring." From a different point of view, his objection to the proposal was that having been on the panel for some years the insurance practitioners ought to recognize that an immense shackle was being bound round their necks. He had in his hand three volumes of inquiries and appeals that had been made under the Insurance Act. The first volume in point of size was a small one; the second was also small, but the latest was much larger. The price of the small one was 9d., and of the large one 3s. If the dependants were included they would have a 5s. book and an extra edition. Furthermore, who was going to pay for the cost of including the dependants—the employers, the workers, or pay, and doctors were in the middle classes, and they could not stand any more taxation. The proposal might be practicable in twenty years, but not at present. (Laughter.) He begged the meeting to exercise its freedom of choice, and to vote at all events against the inclusion of dependants.

Dr. BRACKENBURY drew attention to a sentence which the

Council had deliberately put in at the beginning of Part II:

"The following sections of this Memorandum are not self-contained, and must be read in connexion with each other."

The proposal, therefore, for the inclusion of the lower class dependants was coupled with recommendations for reforms on which everyone was agreed, as to records, as to complaints, as to judgements, as to administration. In paragraph 8 it was stated:

"The medical provision should be available for those persons, and only for those persons, who would be unable to obtain it without the help of the insurance scheme."

Nobody had controverted that principle; but it would be going against that principle if the wives and children of the lower paid insured persons were not included, because obviously they did need attention and help. The proposal went a good way towards preventing a State medical service. In Hastings—thmt favoured town—they had had trouble over the school medical clinic; they had had to help the Hastings men to prevent the school medical clinic being extended in ways which the local men did not like. But if the men there were not going take on the treatment of those who legitimately attended the school medical clinic, the dependants of the lower paid insured persons, then the alternative method must be adopted. In his opinion the profession was faced with a most important crisis. If the inclusion of the dependants of the lower paid insured persons was repudiated, they were defenceless—he was defenceless himself in face of the clinics. He could not go to a place and protest against the taking of this, that, and other work by the clinics if he had to admit that the Association had deliberately repudiated the only alternative it could offer. He would have to go and say, "By all means extend your clinics; the profession has said it will not do the work by the family doctor method; it has chosen the clinic method." If this alternative was repudiated, the only thing for a State which cared for the health of the people was to go ahead with the clinic system. At present the treatment was limited to treatment at the clinic, but if the amendment of Mr. Turner were carried it would tend to sweep away that restriction, and the clinic would have to extend its activities into the household, and attend a child with bronchial pneumonia, for example. If the Association at the present stage said it repudiated an alternative method of providing for the attention to the poorly paid persons, what defence could it have against all the proposals which led directly to the worst form of State medical service?

Sir JENNER VERRALL asked that the Conference might be assured that if it voted for the inclusion of dependants the extension to include specialist services would still be given at least an equal place of importance. Dr. BRACKENBURY said that the Conference might be assured on that point. It was merely a question of priority.

Mr. TURNER said that he had very few remarks to make in reply, because very few speakers had attempted to answer the points he had put up to the Conference. He protested against Dr. Panting's assumption that he (the speaker) was speaking out of merely theoretical knowledge. Dr. Flemming had expressed the view that he had exaggerated the division between the insurance and non-insurance practitioners. The division might not be very marked in the profession, but it hulked largely in the public eye, and that was more important. The non-insurance practitioners were not greatly in evidence in this matter: Dr. Stevens, Dr. Radcliffe, and himself were the only non-insurance general practitioners who went through the mill of the committees which had considered the question. With regard to the statements made by Dr. Sanders as to the voting in the areas, he agreed that the number of areas in favour of the inclusion of dependants was greater than the number of areas opposed to inclusion, but if the expressions of opinion were analysed on the basis of votes in the Representative Meeting there was a majority against inclusion. He also wanted Dr. Brackenbury to remember that nothing they could propose would make the bureaucrats do away with the red tape, and that all the clerical work connected with dependants would be added on to the clerical work practitioners already had to do.

The vote on Mr. Turner's amendment, proposing that dependants be not included, was then taken. There voted in favour of the amendment 75. Owing to the difficulty of counting the hands the number of those voting against could not be exactly stated, but it was announced as approximately 170. The amendment was, therefore, decisively lost.

#### Inclusion of Poor Law Cases.

Dr. BRACKENBURY said that the proposals of the Memorandum were that if financial and administrative difficulties could be overcome the profession would have no objection to the inclusion of Poor Law cases in an insurance system. It was recognized that there were great financial and administrative difficulties—he thought also there might be great legislative difficulties—but all that was said in the Memorandum was that, looking at the subject from the professional point of view, if those difficulties could be overcome and the Government of the day thought that the Poor Law medical service ought to disappear, the profession would have no objection to dealing with that class of persons under an insurance system. The profession made very strong representations to the Government at the time when the Poor Law was being considered, and when it was proposed to carry out many of the recommendations of the Poor Law Commission—which had not been carried out yet—and urged upon the Government an emphatic opinion in favour of separating the medical side of the Poor Law from the other side and of associating the medical side with general public health administration. That representation was made very strongly when the Ministry of Health was being set up, and so impressed the Government that Dr. Addison, then the Minister of Health, read in Parliament a form of words which had been agreed with the British Medical Association and others in which the Government pledged itself to make its first business that of dealing with the Poor Law medical service and the reform of the Poor Law so as to separate the medical service from the rest of Poor Law administration. How, then, were these Poor Law cases to be dealt with if not through the National Health Insurance system? The simple proposal of the Memorandum was that if the difficulties were removed the profession was prepared to accept the inclusion.

Dr. D. O. TWINING (Devonshire Panel Committee) moved:

That this Conference considers that there is a serious objection to the inclusion of Poor Law cases under the National Health Insurance Acts, as such cases are not suitable for treatment at a practitioner's surgery.

He said that his Committee was against the inclusion of patients who at present came under the Poor Law, and that for more than one reason. In Plymouth it was stated that the people who came in under the Poor Law were not the kind of people whom it was suitable to have with other patients in their surgeries. Some were verminous and dirty, and it was necessary to deal with them at separate times. To include them in the same status as the present insured patients was not fair to the latter. Moreover, all who came in under the Poor Law were actual patients, not potential patients—they were all of them ill—and the average number of attendances, which in the case of the ordinary insured person was about six a year, would be in the case of the Poor Law patient about one a week.

Dr. C. E. S. FLEMING asked how many Poor Law medical officers at present in practice did provide separate waiting rooms and surgeries for their verminous and dirty patients.

Dr. T. WOOD LOCKET (Insurance Acts Committee) said that he was in favour of the policy of the Memorandum. He thought it would be necessary to accept Poor Law patients under some insurance scheme. He wanted the Conference to appreciate, however, the position of Poor Law medical officers in country districts. They had been treated in a preferential way in order to retain doctors in such districts. While it might pay the urban men very well indeed to go on a capitation basis, if the preferential treatment hitherto accorded to men in country districts, in the shape of a higher rate paid per unit of population, were abolished it would be necessary to consider very carefully what compensation was to be accorded to the men who were affected.

Dr. A. E. COPE (Westminster and Holborn Division) insisted that attention ought to be paid to the conditions under which any change of this kind was brought about, because even the urban officers were likely to suffer very considerably unless their interests were safeguarded. In any change that took place by Act of Parliament the existing officers would be practically robbed of their superannuation benefits, and would be able to claim only about two years' salary as bonus.

Dr. TWINING said that the easiest way to ensure that the Poor Law medical officers were not hardly treated was to keep the existing system going.

The Devonshire amendment was lost by an overwhelming majority.

#### Medical Records.

Dr. TWINING next moved the deletion from paragraph 6 of the Memorandum of the words "clinical records have been or are being provided which may be made of great service in relation to medical research and public health." He objected to this implicit blessing being given on the cards as they were at present, for he thought them pretty useless.

Dr. DAIN hoped the Conference would not adopt this amendment. Surely it could agree to such a sentence as Dr. Twining wished to delete. The Conference of Local Medical and Panel Committees had objected to the constant recording of "A's" and "V's," but that was not the clinical part of it. The Insurance Acts Committee would be only too delighted if the Government took advantage of clinical records and used them for some practical purpose.

This amendment also was rejected by an overwhelming majority.

#### Voluntary Contributors.

Dr. TWINING's next amendment called for the abolition of all provision for voluntary contributors under the Insurance Acts. He considered that such provisions violated the principles of insurance, owing to the fact that unhealthy persons alone sought to continue under the Act as voluntary contributors after ceasing to be compulsorily insured. He hoped that this point would be borne in mind when the witnesses came to give their evidence before the Commission.

The CHAIRMAN pointed out that what the Memorandum said was that the problem was a small and diminishing one, and it was not proposed to take such drastic steps as Devonshire suggested. Dr. TWINING urged that although the point was small it was very irritating. Dr. DAIN said that the voluntary contributors were so small in number that they scarcely appeared in the scheme at all. He did not think that the witnesses before the Commission ought to be tied down in this particular.

The amendment was lost.

#### Specialist Services.

The CHAIRMAN then stated that paragraphs 1 to 18 of the Memorandum had been implicitly approved. These included the question of persons to be provided for; the next question was the extent of the provision to be made. Here an amendment from the West Bromwich Division was referred to Council for its consideration. It asked that paragraph 20 might be revised to read as follows:

"That benefits be urged in the following order of importance, with special stress on the first and second: (1) domiciliary consultations; (2) ophthalmic, dental, x-ray, and pathological service; (3) out-patients."

Dr. J. S. MANSON (Warrington Division) moved to amend paragraph 24 so that specialist service should include the operations of major surgery performed on insured persons by general practitioner surgeons as well as those by specialist surgeons. It was felt in his area that the general practitioner who undertook an operation would, as matters stood, receive no recognition at all unless he became a specialist. He thought it ought to be made clear to the Commission that general practitioners who did not become specialists or did not want to be recognized as such, and performed urgent and life-saving services on behalf of insured patients, should have proper recognition.

Dr. W. HAIG (Perth Division) did not think that such operations of urgency, which the practitioner must undertake if he was to save his patient's life, ought to be included in this category.

Dr. DAIN said that the representatives of insurance practitioners, in dealing with this question, had always held the position that a general practitioner who specialized in any department should be recognized as such, and entitled to charge fees for such services. The position of the general practitioner who performed specialist services would be fully protected in any arrangements put forward.

The CHAIRMAN said he rather gathered that there was a fine point in this which was not covered by the Memorandum. It was true that in the Memorandum provision was made for the general practitioner serving as a general practitioner and as a specialist in a specialism in which he satisfied certain criteria, but he gathered that Dr. Manson was desirous that an emergency operation undertaken by a practitioner who was not habitually performing major or specialist operations should in some way be brought within the sphere of specialist remuneration. That was a difficult point, and the matter might well be referred to the Council.

It was agreed to refer this matter to the Council.

On the Conference adjourning for the luncheon interval, it was announced that Dr. Brackenbury had had to leave owing to the dangerous illness of his daughter. It was at her special request that he had attended the Conference at all. On the motion of Dr. WALLACE HENRY, seconded by Dr. J. A. MACDONALD, the members passed a vote of sympathy. Dr. Brackenbury was able to attend in the afternoon again for a part of the session.

#### MATERNITY SERVICE.

The first business taken on the reassembling of the Conference was the relationship of maternity work to National Health Insurance, as set out in paragraph 29 of the Memorandum.

Dr. BRACKENBURY said that this was an extremely difficult matter to put clearly, and he was not sure that the paragraph itself put it as clearly as it should. There was a paragraph on this subject about three years ago in a report which was passed unanimously by the Conference of Local Medical and Panel Committees. That paragraph was practically identical with the paragraph which appeared in this place in the original Memorandum. The paragraph afterwards came up in a more comprehensive report to the Representative Body, and the report in which it appeared was approved without opposition, although he was not sure that the Representative Body had its attention directed particularly to it. This paragraph, after reappearing in the original draft of the present Memorandum, was considered by the Divisions, and although in some cases there was serious opposition, a large majority of the meetings throughout the country endorsed the paragraph, some putting in provisos, and in certain respects these had been incorporated in the paragraph now before the Conference with a view to strengthening the position which it set out. One of the difficulties was that professional opinion appeared to vary so enormously in different parts of the country. In large numbers of areas the practitioners regretted any loss of touch with maternity work in its normal aspects. On the other hand, certain legal developments had made it almost dangerous for a man to touch maternity work at all. Therefore it was necessary to be very careful in framing proposals, and to maintain a very broad outlook, bearing in mind that large numbers of doctors in different parts of the country took diametrically opposite views as to the undertaking of this work. On going before a Royal Commission offering evidence on the relationship of maternity work to a National Health Insurance scheme it was necessary first of all to consider the public and general health aspect. It was not desirable that maternity work should be considered a thing apart, unrelated to other national health activities. It was, in fact, an intimate part of national health work, and it ought to be kept in close touch with other health services, whether under the Act or not. At present the provision for attendance on mothers before and after confinement was very partial and incomplete; it was unrelated also to the other activities of ordinary medical practice. Three things at least were felt to be wanting in the provision made. First, it was a national necessity that if there was any abnormality in the woman about to become a mother, that abnormality should be discovered before the time of confinement.

Secondly, any doctor called in to attend the woman at the confinement in abnormal circumstances should, if possible, have had some previous knowledge of the patient; he should not be called in at haphazard by a midwife. Thirdly, the provision should be more complete, so that if the doctor who was attending the patient in an abnormal confinement wanted specialist advice or institutional treatment, this should be forthcoming. What seemed to be most desirable was that before the confinement some doctor should be made responsible for the case, even though he was never actually called into it at all—that was to say, even though the confinement was normal and the preceding and ensuing circumstances called for no medical assistance. These were the proposals of this paragraph. But from the professional point of view certain difficulties arose. It was necessary to put in the forefront the right of any doctor to refuse this work if he did not want to do it, and it was proposed to make that an essential condition of any association between maternity work and the insurance scheme. Then it had to be made quite clear that there should be no question of complaint in connexion with this service going before any other than a purely professional committee. ("Hear, hear.") Further, there must be some assurance of an adequate supply of competent midwives or nurses and of the accessibility when needed of specialist services and institutional accommodation. Those were important provisions, of which some could be met at once, but all could not be met for some considerable time. A great difficulty arose owing to the different points of view in the profession with regard to maternity work. A pregnant woman, whose insurance practitioner had signified that he was not prepared to undertake maternity work, should have an opportunity of choosing another doctor for that purpose, one who was willing to undertake the responsibility for her confinement. It was important that this doctor should, before the contingency arose, be brought into contact with the prospective patient. This could be done either by the woman having a fresh choice during pregnancy—handing herself over as a kind of "temporary resident," as someone had said, to the new doctor, and resuming her place on the list of her former doctor when the puerperal period was over; or by some system of consultation in which the insurance practitioner would remain responsible for the patient up to a certain period before the confinement, and the other doctor would "take over" the patient during the period itself. He confessed that the statement in the paragraph itself pointed almost entirely to the former of these two methods; he himself was more partial to the latter. It was important, if the general principle was accepted, that the Conference should indicate to the Council which of these two methods it preferred, so that the wording of the paragraph could be amended to remove any ambiguity.

Dr. FOTHERGILL asked whether the conditions set out in paragraph 40 (4) and (5), relating to appeals to the Courts in one case and to a duly constituted professional committee in another, would apply to this proposed arrangement. Dr. BRACKENBURY said that these conditions would apply to the whole service, but in the maternity case the tribunal should be a purely professional committee.

Dr. WALLACE HENRY asked whether it would be open to the doctor who had declined to go upon the panel to accept individual cases, in the same way as in private practice. Many men who did not in the ordinary way undertake maternity work were willing to attend special patients. Dr. BRACKENBURY said that that conundrum required a good deal of consideration, but on the spur of the moment he would say that the doctor should be at liberty to do so.

Dr. J. A. MACDONALD asked whether it would be possible for a woman to engage a doctor not on the panel to attend her during the maternity period. Dr. BRACKENBURY replied: Oh, yes.

Sir JENNER VERRALL asked whether he was right in assuming that there would be a special sum available out of which the woman could pay a fee if she chose. Dr. BRACKENBURY said that she would have a cash benefit.

At this point the MEDICAL SECRETARY read a revised paragraph 29 which Dr. Brackenbury had drafted, and which

might be regarded as meeting the case better than the paragraph in the Memorandum:

29. The relationship of maternity work to the health insurance scheme requires special mention. At present attendance in connexion with confinement is expressly excluded from medical benefit, and such public provision as insured women and the wives of insured men can avail themselves of is under other auspices and is not complete in character. The Association is of opinion that attendance in connexion with confinement should be brought into close and proper relationship with medical benefit in general, and that, in addition to a cash payment, provision should be made under the insurance scheme whereby insured women and the wives of insured men should be entitled both to suitable ante-natal supervision and to attendance at confinement and during the puerperal period. It would be no doubt be preferable, if possible, that this attendance should be given throughout by a registered medical practitioner. A large proportion of normal births are, however, at present attended by midwives only, and as this appears generally to be satisfactory an insurance scheme can scarcely be expected to provide more than this in such normal cases. Nevertheless, it is clearly desirable that any abnormality that could be discovered before the actual confinement should have been noted, that any practitioner consenting to be called in by the midwife in any abnormal condition should have had previous knowledge of the case, and that there should be proper means for dealing with any abnormality that may arise. Within these limits, therefore, every maternity case should be in relationship with a responsible medical practitioner, though if the mother asked for the actual attendance of such practitioner at a normal confinement this would be an arrangement outside the insurance provision. Provision for a woman within the insurance scheme would thus be for (a) ante-natal examination (if desired) and supervision; (b) attendance by a registered midwife during normal labour and the puerperal period; (c) attendance by the practitioner of her choice during labour and the puerperal period when his attendance is requested by the midwife under defined conditions or when, as the result of his ante-natal examination, he has declared his personal attendance to be necessary. Professional services under these headings would be remunerated, as in the case of the other extra services, by a special scale of fees.

29a. Certain conditions are absolutely essential if any arrangement of this kind is to be effective. Such conditions are:

- (1) as in 29 of Memorandum.
- (2) as in 29 of Memorandum.
- (3) as in 29 of Memorandum.
- (4) the consultant and specialist service should be available.
- (5) as 29 (4) of Memorandum.
- (6) as 29 (5) of Memorandum.

The procedure would thus be for the insured woman, at an early stage of pregnancy, to consult the insurance practitioner, who, in the great majority of cases, would accept the responsibility for maternity attendance. If the insurance practitioner did not accept this responsibility it would be his duty to arrange for consultation with (and, if desired, ante-natal examination by) another practitioner chosen by the woman, who was prepared to accept this responsibility in accordance with the scheme. If, during pregnancy, at confinement, or during the puerperium, conditions arose which, in the opinion of the practitioner, necessitated consultation with a specialist or institutional treatment, such consultation or treatment would be available under the ordinary conditions of the service as set out in other paragraphs of this Memorandum.

Dr. I. W. JOHNSON (Bury Division) moved:

That in the opinion of this Conference, under any proposed extension of medical benefits, it is neither necessary nor desirable to include medical attendance under any scheme of maternity benefit.

He said that this practically wiped out paragraph 29 in its entirety. He congratulated Dr. Brackenbury on his able pleading for a bad case. The Bury Division took the view that to include the provision of maternity benefit was neither necessary nor desirable. In the action which the Conference had taken that morning, in assenting to the inclusion of dependants, it had affirmed no new principle; it had only extended a service already existing to another class of the community. But paragraph 29 broke new ground. He claimed that there was no necessity for the inclusion of this provision under any extension of insurance work. All the treatment foreshadowed either already existed under arrangements made by the Ministry of Health, or, with a very slight modification, was available through the machinery which they had carefully built up for dealing with maternity cases. Ante-natal work was an exception, but no doubt the Ministry could be persuaded by the representations of the profession to include that also in the present system. Under this proposed scheme a machine which was working smoothly was being sacrificed and another machine constructed about which they knew nothing at all. If this scheme were adopted, innumerable new Regulations would be foisted upon practitioners, all

sorts of penalties and obligations would materialize. It was all very well to say that complaints would go before a professional committee. A sop was thrown out to the non-panel practitioner, but he could not imagine any non-panel practitioner coming in under the obnoxious regulations which would attend the whole subject. These proposals were carried by only a small majority in the country, and he hoped they would be decisively rejected by the present Conference.

Dr. LOCKHART LIVINGSTON (Winchester Division) said that he was instructed to vote against the inclusion of maternity practice. There were three reasons why this should not be included in an insurance medical service; (1) it was already sufficiently provided for under the county council maternity and child welfare schemes; (2) it would introduce bureaucratic methods into midwifery practice; (3) men who had the biggest general practices stated that women would not have these matters arranged for them—they insisted on making their own arrangements.

Dr. GORDON WARD (Kent) thought much of what Dr. Brackenbury had said was doctrinaire rather than practical. The paragraph was such as he would expect to come from a Committee the majority of whose members had no experience of maternity work, but in insurance practitioners another point of view was essential. He denied that there was any demand by the profession for the inclusion of this service, nor did he find any great demand from the laity. Those who had appeared before the Commission had pleaded for the inclusion of the service on two grounds only: one, that they did not see why it should be excluded—these were approved society representatives; and the other—which contained an aspersion on the profession they ought to meet—that as soon as the maternity grant was increased the doctor's fee also rose. He would like to be sure the Committee had figures to put before the Royal Commission to refute the accusation; if they had not, another body had. (Laughter.) He did not believe the ordinary practitioner would willingly take the work at the usual county council fee. In that case the Government would be unable to provide the benefit. It might be that some of the essentials named were not in the power of any national health authority to provide—for example, institutional treatment—and hence it would be very difficult for the Commission to put up to Parliament a scheme containing the Committee's essentials. Coming to the question of the outside practitioner, who, if a doctor refused the service, was for nine months to exercise supervision over his patient, he considered the provision was opposed to the ethics of the profession. It was an amazing suggestion that a woman should be the patient in two different systems. As to fees, no scale was suggested, but it would be difficult for them to ask for a higher scale than that accepted by the county council. That scale, in the opinion of his Committee, was insufficient. The professional complaints tribunal could not, he thought, be defended to the public, who would say, "The doctors have something to hide." Finally, he asked, was the provision to apply to the wives only of those who were less well paid or to wives of all insured persons? In either case they were faced with difficulties. He asked the Conference utterly to reject maternity service as part of the Insurance Act.

Dr. C. E. S. FLEMMING (Bradford-on-Avon) could not agree that there was no demand from the public for an improved midwifery service. During the last year or two there had been an outcry from many public bodies as to the unsatisfactory condition of the present midwifery service. The ante-natal part of the service was to a large extent new, and it was getting into the hands of the public health authorities. It was being done by maternity and child welfare committees. That was exactly what they did not want, or at least, if it got into the hands of such committees, the work should be done by the general practitioner. Most of the work could be properly done in the homes of the patients, or the medical man could judge whether extra apparatus or specialist service was required, and these cases could be referred to the maternity clinic. General practitioners should not allow this new work to slip out of their hands. Actual midwifery work was passing into the hands of the midwives; the proposed scheme would give the doctors an opportunity of retaining

it. He would like to see it made compulsory for pregnant women to see a medical man before receiving maternity benefit. Under the scheme, it would cost an insured person no more to be attended by a medical man than at present, so that he would probably have more cases to attend; in addition, he would have the fee for ante-natal attendance. Dr. Flemming hoped the practitioner selected by a woman to attend her would, if not an insurance practitioner, only be expected to attend her in so far as her pregnancy and illnesses in connexion with it were concerned. He did not think there would be any difficulty in attendance by two medical men.

Dr. MANEL RAMSAY (Insurance Acts Committee) hoped that the meeting would consider not only the interests of the profession but the interests of the insured women. They could not go before the Commission without trying to do something fundamental for the maternity service of the country. No doctor could look on the results as published in *Damo Janet Campbell's* Report with any sense of pride. The fact that maternity mortality figures to-day were no better than twenty years ago showed the urgent need for improvement. The Committee had put forward an adequate scheme. Having done midwifery in public health service, as a general practitioner, and as a specialist, she desired to see the service greatly improved. It was a comparatively small extension to take full charge of the insured person in all phases. She rebutted the charge that they were trying to place the care of maternity in the hands of the midwife. On the contrary, they claimed throughout that the supervision of the pregnant woman, ante-natally and during and after parturition, should be the care of the medical man or woman. All that was needed was that the woman should have a good midwife, and that a doctor was available when she needed one.

Dr. H. D. WOODNORR (East Norfolk) opposed the retention of paragraph 29. If this scheme was put into effect a very much larger number of women would be attended by midwives. He thought that those who had drafted the Memorandum had underrated the work done by insurance practitioners. They did see their confinement cases before attending them. In the country the supply of nurses was inadequate because there was no possible method whereby nurses could be remunerated sufficiently to maintain an adequate supply. District nurses were willing to work under local committees whom they knew, but if they were put under the control of the county council they would jib at once, and one would lose them, and the supply would be still more inadequate. It seemed to be assumed that normal confinements would be invariably attended by midwives. But how were young practitioners to gain the ability to tackle abnormal cases if they were denied experience of the normal?

Dr. J. G. McCUTCHEON (Glasgow) strongly approved of paragraph 29. Much had been said in the course of the discussion that morning as to the possibility of losing patients through their going to various treatment centres. In one of the suburbs of Glasgow—the constituency of Mr. Wheatley, lately Minister of Health—it had been decided to establish a maternity home in association with maternity centres, and at the home there would very likely be a whole-time maternity officer. In Glasgow only 38 per cent. of maternity cases were attended by practitioners. This was largely due to two factors—in the first place, because practitioners did not get paid their fees, and, in the second, because they were busy men and could not afford what were called the "false runs" so frequently occurring in a maternity case both night and day. On the other hand, if a midwife who knew her business was in attendance, the doctor was not likely to get a call unless he was really needed. It had been said by a former speaker that new grounds were opened up under paragraph 29. The only new ground was that a custom which was already in being in large industrial centres was openly acknowledged. If the maternity work was done by a midwife it could surely be left to her to call the practitioner in for anything abnormal, and the patient could be assured to that effect. He asked for strong support of the paragraph.

Dr. T. WOOD LOCKER (Insurance Acts Committee) asked the Conference to think seriously before voting down the proposals in the Memorandum. Women of the insured class

went increasingly to the midwife rather than to the doctor. Under this scheme the doctor would be brought in touch with the insured pregnant woman before the midwife had anything to do with the case. The doctor would have the opportunity of saying whether it was necessary, in view of the condition and history of the woman, that she should have medical attendance at her next confinement, and if it was decided that the presence of a doctor was necessary the midwife would be instructed to send for him as soon as the confinement occurred. Of the two alternatives stated at the end of Dr. Brackenbury's speech, he favoured the second.

Dr. J. W. BOXE (Insurance Acts Committee) said it was with considerable reluctance that he rose to support the motion for the deletion of paragraph 29. He was on the subcommittee which originally considered this question, and consequently he found himself in the painful position of asking for the deletion of a clause which the committee and the Council had approved. He wanted to put his case from three points of view. First, the paragraph was not a scheme, because nobody understood it. Some people thought that it was intended to have two doctors during the period of pregnancy, one of them chosen by the patient for the purpose of the maternity period, and the other the ordinary insurance practitioner, and that both were to act in different capacities on behalf of the woman. The paragraph embodied a series of propositions which had been put in to please a multitude of counsellors, but no concrete scheme. Secondly, this was the first time in the history of the Association that it had repudiated the practice of normal midwifery. It had previously affirmed its belief that normal midwifery, like every other kind of midwifery, should be kept in the hands of the profession; now it was proposed to hand it over to midwives. There were in this country about 54,000 midwives; many of them were ex-domestic servants, who had had six months' training. Thirdly, the insured woman had certain rights. She had the right to have a doctor to attend her in her first confinement. By this paragraph that right was being deliberately taken away from her. ("No.") It was laid down that in her normal confinement provision was to be made for a midwife. Who was going to pay for this? Why, the woman, of course. Supposing she said, "I do not want a midwife, I want a doctor." She could have one, but she must pay for him out of her benefit, and therefore she was paying twice—paying through the capitation fee for the midwife whom she did not want, and paying from her ordinary resources for the doctor whom she did want.

Dr. BRACKENBURY submitted that Dr. Bone had not given any reasons why the whole of paragraph 29 should be deleted, and he had given several reasons why it should be retained. With regard to Dr. Woodroffe, either the paragraph was ambiguous or the explanations had been imperfect, for all the things of which Dr. Woodroffe had spoken in describing the present position seemed to the speaker to be arguments in support of this paragraph. It was stated in the paragraph—more clearly in the paragraph as revised—that the best thing was for the woman to have a doctor. It was desired to encourage her to have a doctor, and this at least was secured, that a doctor was brought into association in every maternity case. All that was said was that in existing circumstances it could not be expected that a doctor should be provided by the insurance scheme for every case of normal confinement. That was a proposition which in the existing state of affairs could not be put to the Ministry of Health. And if every case of normal confinement had to be attended by a doctor he wondered whether that would be really acceptable and agreeable to the profession. It would mean attending three times as many midwifery cases as they did at present. But it was important that the doctor should be brought into association in every maternity case. To ask that the fee for attendance by a doctor in every normal case should be provided by the insurance scheme was altogether too big a demand on the scheme as it existed at present. But the Association's witnesses must not be required to go before the Royal Commission and say that they had nothing to propose with regard to maternity benefit. He begged that the witnesses might be allowed to go and say that the profession wanted certain improvements, particularly with regard to ante-natal work and institutional provision, and

so on, and desired that a doctor should be associated with every maternity case.

Dr. JENKINSON, who had moved the amendment, said that with much that Dr. Brackenbury had stated everybody would agree. There was room for improvement in the maternity service. But by bringing midwifery in any scheme of national insurance the ideal was not going to be achieved.

The Bury amendment was then put to the Conference and lost by a very large majority.

Dr. FOTHERGILL had an amendment expressing the view that the general practitioner part of a complete maternity service should be limited to pre-natal examination with subsequent attendance for that period of time during which, under Clause 8 (3), Part I, First Schedule, of the Medical Benefit Regulations, an insurance practitioner at present is not responsible for treatment. He said that the first time the draft came forward for criticism it was thought that the word "supervision" in paragraph 29 meant a general looking after the pregnancy of the woman; but later Dr. Brackenbury had put forward quite another interpretation, that the maternity doctor was to attend the woman for every complaint or accident, however unrelated to pregnancy, during the period in question, which under this arrangement might be eight or nine months. This would mean that those doctors who did not do maternity work would eventually lose the mothers of families as patients altogether, and with them would go the other members of their household, so that the practitioner would be left to attend only bachelors and spinsters. He wanted to know exactly what Dr. Brackenbury meant by "supervision."

Dr. BRACKENBURY said that it was not a question of what he meant but of what the Conference meant. There were two alternative methods of providing for this pre-natal attendance. If the Conference would indicate its preference the Council could be left to revise the wording of the paragraph. The number of cases in which any question of an alternative would arise would be very small, for in most cases the woman's insurance practitioner would be the practitioner in charge during the pregnancy. It was only when the practitioner refused maternity work that any question would arise. But the issue was this: Did the Conference prefer that from the time the woman recognized that she was pregnant and desired attention in connexion with maternity she would go over entirely for this period to a new doctor of her choice, or that there should be an obligation on the insurance practitioner on whose list she was, but who was not willing to attend her during confinement, to make arrangements to consult with and to inform the doctor whom she did choose to attend her, if necessary, during her confinement of all those conditions which it was important for him to know about? Personally he preferred this second alternative.

Dr. J. A. MACDONALD asked at what period this consultation service would cease. Dr. BRACKENBURY answered: Ten days after the confinement.

Dr. BOXE asked what would happen in a case of premature labour. Dr. BRACKENBURY said that if the woman had a miscarriage before the twenty-eighth week the insurance practitioner would attend her as he now did. If there was premature labour after the twenty-eighth week she would call in the maternity doctor, her insurance doctor having ceased to act in such a contingency.

After some discussion it was thought well, Dr. Fothergill agreeing, to put the question to the Conference in this form: Did it favour (1) the transference of the pregnant woman from the ordinary practitioner's list to another doctor on a maternity list for a specific period for all purposes, or (2) making it obligatory on the insurance practitioner during the maternity period to arrange for the consultative service of another general practitioner who did not refuse to take maternity cases?

The voting was almost unanimously in favour of the second of these alternatives, and it was left to the Council to adjust the wording of the paragraph in view of this vote.

Dr. GEDDON WARD (Kent Panel Committee) moved:

That midwifery services should be provided on the basis that payment therefor is to be drawn from cash benefit payable to the person benefited on such conditions as may be decided.

He regretted that on the spur of the moment he could not

state the conditions, but he thought the cash benefit basis would offer a possible means of reconciling divergent opinions in that Conference. After a short discussion the amendment was lost.

Dr. TWINING brought forward an amendment the purpose of which was to make it quite clear in the Memorandum that any extra services would be paid out of special funds, in order that the general practitioners' fund should remain intact. Dr. BRACKENBURY agreed to add some words to the appropriate paragraph making this quite clear.

#### Complaints.

Dr. GORDON WARD criticized the Memorandum on account of the procedure it suggested for dealing with complaints; he urged that in this respect it was not sufficiently definite. Dr. BRACKENBURY read paragraph 40, and described the procedure laid down. Dr. WARD asserted that the function of the purely professional committee set out in the Memorandum could only be interpreted as that of "reporting" on the case; Dr. BRACKENBURY and others maintained that it meant "judging" or "deciding." An amendment by Dr. WARD was lost.

Dr. L. J. PICTON (Cheshire Panel Committee), referring to the statement in paragraph 40—"that an appeal to the Courts should be possible not only on the ground of improper procedure as at present, but also on the ground that the penalty inflicted was out of proportion to the offence"—said that his Division had always been exceedingly keen on this matter, and they were glad that the principle of an appeal to the Courts was embodied in the Memorandum. But they wished it to be extended, so as to cover not only an appeal for mitigation of penalty, but an appeal on the merits of the case. He moved:

That paragraph 40 (4) be so altered that an appeal may be made not only with the object of mitigation of penalty, but on the merits of the case.

What the Conference had already done, greatly enlarging, as it would if carried out, the scope of the Insurance Act, made the resolution all the more important. Doctors should be placed on the same footing as any ordinary citizen; there ought to be the possibility of an eventual appeal to the Courts. It would seldom be used, but it would confer a sense of freedom and provide a safeguard against harsh, tyrannical action of any Ministry.

Dr. BRACKENBURY said that the Insurance Acts Committee had discussed the matter for more than ten years, always deliberately coming to a conclusion opposite to that of Cheshire. Two considerations, the first not easy to make clear, both important, had always decided the action of the Committee. First, Parliament voted money for the insurance service, and entrusted to a Government department the administrative duty of seeing that it was properly used. They could not do away with the administrative part of the monetary machinery of the country by saying that in all the cases under consideration the Law Courts should have the final say. As long as the Ministry of Health had the duty of seeing that moneys voted by Parliament for the purposes for which they were voted, the Ministry must have a certain amount of quasi-judicial authority as regards the granting to or the withholding of money from authorities which did not use it properly. Secondly, if there was unlimited appeal, it could be used by both parties. At present there was a right to an appeal to the Courts from the decision of the Ministry if the proper procedure had not been adopted. If it was alleged that the Ministry had not carried out the Regulations, or even if it was alleged that the atmosphere of the court or committee in which they were carried out was not a judicial atmosphere, they could go to the Courts and claim that the procedure was irregular and that the penalty should be quashed. The paragraph suggested that, in addition, they should be able to go to the Courts on the ground that the penalty inflicted was out of all proportion to the offence alleged or proved. That was safe, but if they did what Cheshire wanted, and there was an appeal to the Courts on all grounds on all occasions, not only the doctor but the patient could appeal, the approved society could appeal; and they had always come to the conclusion that that would be worse for the profession than if there were no appeal at all. They did

not want to give insured persons or approved societies or officials on their behalf the unlimited right of appealing to the Courts in every case in which a doctor had been acquitted by the Medical Service Subcommittee.

Dr. GORDON WARD (Kent Panel Committee), supporting very strongly the Cheshire resolution, said he was aware of the administrative argument advanced by Dr. Brackenbury, and that held so long as the Minister of Health behaved in a reasonable, tolerable fashion. But if he did not so behave, then it was for them to press for whatever means were available to make him do so. Such means were an appeal to the Courts. That that was necessary in some cases was admitted by the recommendation of the Memorandum, to which Dr. Brackenbury subscribed. The administrative considerations no longer sufficiently protected them, and he cited a case which was not one of excessive penalty or involving a point of law, and yet one that ought to be brought before the Courts.

Dr. PICTON replied that every word Dr. Brackenbury had said about the administrative difficulty, and the Ministry of Health being responsible to Parliament, operated equally against the recommendation of the Council, that the appeal should be for mitigation of penalty. His argument was either true in both cases or not at all.

The amendment was then put and lost, 65 voting in its favour, and 79 against.

#### Administration.

Dr. TWINING (Devonshire) moved to delete the final clause in paragraph 44, which stated that county and county borough councils were probably the least unsuitable bodies to have the administration of health services. Those for whom he spoke preferred Insurance Committees.

Dr. D. F. TODD (Durham Panel Committee) supported this amendment. County and county borough councils were the worst possible bodies. In a great part of the country they were constituted on political lines. He preferred to keep the Insurance Committees, though these should be reconstituted in certain respects. Many medical officers of health, again, were all that could be desired, but there were a large number of others who had no knowledge of or sympathy with general practice.

Dr. H. J. CANDALE (London Panel Committee) could not endorse this laudation of Insurance Committees. They were bodies with a large number of members who were supposedly representative of insured persons, but who really represented the bureaucratic staffs of approved societies. In his own experience the only lay members of the Insurance Committee who were at all sympathetic with the medical profession were the representatives appointed by the county councils.

Dr. BRACKENBURY asked whether it was really proposed by those who loved Insurance Committees so much that they should have, what was set out in these paragraphs, the control of all public health administrative matters. If there was to be a unification of administration of all health services, including the insurance service, the administration must be ultimately in the hands of one body. The Insurance Committees consisted largely of officials of approved societies, together with a number of representatives of county or town councils. The policy of unification had been endorsed by the Council, the Representative Body, and all bodies within the profession. The proposal was not that these authorities, the county or town councils, should have unlimited power, but that they should act through a statutory committee upon which there would be proper representation of all interests concerned, including the medical profession.

The amendment by Devonshire was lost by a very large majority.

Dr. O. R. M. WOOD (West Suffolk Division) moved, in connexion with paragraph 46, that the general administrative officer should be an officer who had had experience of general practice.

Dr. MORTON MACKENZIE (Reigate Division) supported this amendment. The Memorandum, he said, was not very clear on this point. If there was going to be any question of control of the insurance service it should be in the hands of a man who had had some recent experience of general practice.

Dr. FORTMEYER said that regard must be had to the fact that this was an endeavour to get the whole of the health services under one control. If the public health services as at present existing were to be taken in it must be recognized that the medical officer of health had a status. It was laid down in the Memorandum that with the medical officer should be associated the chairman of the local medical committee in its new form, a man who would be a clinician, and any reasonable medical officer of health who wanted an efficient service would be bound by his advice on clinical questions.

The CHAIRMAN said that this chief administrative medical officer would supervise all the work under the unified health services. Some districts in the country might be unfortunate in their experience, but, generally speaking, the public health service contained most admirable officers.

The West Suffolk amendment was lost by a considerable majority. An amendment by Devonshire similar in effect was also lost.

#### Certification.

Dr. H. C. JONAS (North Devon Division) moved:

That this Conference is of opinion that paragraphs 50 and 51 do not adequately express the objections of the medical profession to the present certification rules obligatory on insurance practitioners, and therefore desires the Memorandum of Evidence to be amended accordingly.

Dr. Jonas said that once again the question of certification was going to suffer through coming on at the very end of the agenda, but, anxious as members were to get away, he did wish to make out a case for the general revision of the certification rules. The rules as they stood at present were objectionable in several ways. If they were to be kept properly they necessitated a knowledge on the part of the insured person as to their exact nature, and at present no effort was made to acquaint the insured person with the rules. Even the higher officials of approved societies did not know so much about the certification rules as the medical members of Insurance Committees. A great deal was said about these certificates being a check on the funds of the societies. To hear people talk one would imagine that the proper object of those funds was that approved society reserves might be accumulated. But actually the approved societies were in the position of public trustees for insured persons, who were entitled to the money as soon as they became sick. He went on to argue that the certificate was twofold. In the first place, it was a medical opinion that a person was suffering from some condition, and in the second place, a non-medical statement, "I have to-day examined." Nearly all the complaints about certification related to this non-medical part of the certificate. By the certification rules the doctor was obliged to see the patient every time the certificate was given. These regulations as to certificates kept many doctors from entering the insurance service. He urged that the whole question of certification was suitable for inquiry before the Commission.

The CHAIRMAN said that it was obvious that Dr. Jonas and his constituents had taken a great deal of trouble over this matter. Would Dr. Jonas be content with an assurance that the Council, in finally drafting the Memorandum, would take this matter into consideration and see what safeguards could be incorporated?

Dr. Jonas said he was willing to accept that assurance. He maintained that it was quite possible for a medical man to say that a person was unfit for work even though he had not seen him on that actual day, nor perhaps for a week or a fortnight previously. Dr. Jonas, who was given an extension of time by the Conference that he might elaborate his point, went into the matter somewhat exhaustively, and submitted to the Chairman a document which he and others in his area had drawn up. (See SUPPLEMENT, January 31st, 1925, p. 53.)

Dr. J. CASTLEY (Salford Panel Committee) supported the North Devon resolution, as also did Dr. WILLIAMS-FREEMAN, who said that he believed Dr. Jonas had behind him all the rural practitioners of the country. Often they found themselves obliged to go and visit a man eight miles away to give a weekly certificate, simply to satisfy the approved society.

The amendment was referred to the Council.

#### Age of Entry into Insurance.

Dr. J. M. MITCHELL (West Bromwich Division) moved a resolution expressing the view that the age of admission to medical benefit should be 14 instead of 16 years, thus avoiding the hiatus of two years between the school medical service and the insurance service. Fourteen years was a very usual age for youths to start work, and it was at this time that they were liable to develop scoliosis or incipient phthisis or other conditions.

Mr. BISNOR HARMAN took exception to the resolution, which appeared to him to state that 14 years was considered a suitable age for a lad to go to work. He dissented from that view. By making the age 16 there was an implication that 16 was the earliest age. To prevent any gap, would it not be well simply to say that a worker should be entitled to medical benefit as soon as he or she commenced work?

Dr. J. HOLMES (Bury) spoke, as a certifying surgeon, of the many slight but potentially serious ailments he had seen in young persons under 16 which certainly required the attention such persons would receive were they eligible for national insurance and placed upon an insurance practitioner's list.

The CHAIRMAN asked whether Dr. Mitchell would accept as an alternative to his resolution: "That a worker should be entitled to medical benefit as soon as he or she commences work, irrespective of the question of age."

Dr. MITCHELL agreed, and this was accepted with one dissentient.

#### Limitation of Lists.

Dr. M. W. RENTON (Kent Panel Committee) had a motion which asked that any proposed legislation controlling further the limitation of medical practice (as, for example, limitation of lists under National Insurance), and which interfered with the accepted principle of the medical profession, should be opposed, and that there should be free choice of doctor and patient respectively. He could find no reference in the Memorandum to any means for safeguarding general practitioners from curtailment of legitimate practice. It was not so much the mere size of the list as the personal factor, the nature of the practice, and the free choice of doctor which determined efficiency or otherwise. His Committee desired to have a clear expression of opinion from the Conference as to whether it approved or disapproved the limitation of the rights of the practitioner to reap the fruits of his earlier efforts, his experience, and his industry.

Dr. J. C. MATTHEWS (Liverpool Division) said that his Division had intended to put up a similar amendment. At the meeting in his area the inclusion of dependants was only accepted on the understanding that limitation of lists would be abolished in the future. It was disappointing to find that there was no reference to this in the Memorandum. It was quite clear, in any event, that the limiting number would have to be increased.

The CHAIRMAN said that Dr. Renton appeared to propose that beyond the existing limitation there should be no further limitation (that is, with regard to dependants), whereas Dr. Matthews wished to abolish all limitation if dependants were included.

Dr. MATTHEWS said that his Division would be content if the Council would take the question into consideration, and, Dr. RENTON speaking to the same effect, this was agreed to as a reference to the Council.

#### APPROVAL OF THE MEMORANDUM.

The Conference then, by a unanimous vote, approved the revised Memorandum of Evidence as amended, and requested the Council of the British Medical Association to place the same before the Royal Commission as the considered opinion of the medical profession of Great Britain upon the matters contained therein.

It was agreed that if there were a full report of the Conference in the SUPPLEMENT it would be unnecessary to print and circulate the minutes, the settling of which was left to the Chairman and Medical Secretary.

A hearty vote of thanks to the Chairman (Dr. Bolam) for the businesslike way in which he had conducted the proceedings was proposed by Dr. D. F. TOWN, and accorded by acclamation.

## SPECIAL REPRESENTATIVE MEETING.

### AUTHORIZATION OF REPRESENTATIVES TO ATTEND CONFERENCE.

THE Special Representative Meeting of the British Medical Association, called on the requisition of the Council, was held in the Central Hall, Westminster, on the morning of Thursday, March 12th, under the chairmanship of Dr. H. B. BRACKENBURY. Its single purpose was to authorize the members of the Representative Body to attend a Conference the same day in association with representatives of Local Medical and Panel Committees to consider the Memorandum of Evidence proposed to be submitted to the Royal Commission on National Health Insurance.

The CHAIRMAN said that a notice of amendment had been given by Dr. Fothergill and Mr. Turner, and after consideration he had ruled it out of order. It had now been sent up again.

Dr. FOTHERGILL, on a point of order, said that it was unfortunate that the Chairman should rule a motion out of order before some explanation was forthcoming from the mover and seconder.

The CHAIRMAN said that this was quite contrary to the ordinary procedure of public business. If a motion which was inherently out of order was allowed to be discussed by its mover and seconder before it was ruled out of order very little progress would be made. But this was a serious matter. A letter had been sent to him by Dr. Fothergill, which was to him painful and extraordinary; it stated that in ruling this amendment out of order he had made himself the partisan of a group of which he was an active member, and that the writer could not see how the members of the Representative Body could have any confidence in their Chairman, whose duty it was to conduct the business without fear or favour. Dr. Brackenbury said that anybody had a right to object to his judgement, but if there was any body of opinion, even a small body, among the representatives in accordance with these views, there would be only one course for him to take. The motion which had been sent in was to the effect that the Representative Meeting should reassemble immediately after the Conference in order to consider the Conference decisions and to determine what action might be taken. He considered, however, with a sincere desire personally to have such a motion on the agenda and get it determined by the meeting, that under By-law 46 he had no option save to rule the amendment out of order. That by-law stated that the business of the meeting must be confined strictly to the specific purpose for which it was called—namely, to authorize the members to attend the Conference, not to authorize the members to review the decisions of the Conference. He had no option in view of that by-law but to rule out the amendment, and because he had done so he was accused by an important and influential member of the Representative Body of an abuse of his position. The question was whether that was endorsed by any considerable section of the meeting. (Loud cries of "No.")

Dr. P. MACDONALD asked whether it would be in order to propose a resolution of confidence in the Chairman. ("Hear, hear.")

Dr. FOTHERGILL asked the opinion of the Solicitor on the point at issue.

The CHAIRMAN said that he did not think this was a question for the Solicitor, though he was quite willing for him to answer it. He took full personal liberty in ruling this motion out of order. The amendment was in fact to call a Special Representative Meeting for a different purpose.

The SOLICITOR (Mr. W. E. HEMPSON) said that he had seen the correspondence which had taken place on this matter. He had considered the position in the light of By-law 46 and also By-law 67. The concluding paragraph of the latter by-law was that no business should be transacted at a special meeting other than that for which the meeting was called. In By-law 46 the terms were drawn very much closer, and, he thought, intentionally so. It was laid down that no business

should be dealt with by a Special Representative Meeting other than that for which it was specifically called. These imperative words had to be weighed in the light of the notice of motion which had been placed on the agenda by the Council. The motion or amendment twice handed in by Dr. Fothergill appeared to him to be entirely outside the terms of the motion which the meeting was summoned to consider, and to bring in definitely fresh material. The word "specifically" used in the by-law was a word of great significance. In his view the by-law made it impossible for the amendment to be allowed.

Dr. FOTHERGILL said that in view of the Solicitor's statement he wished to withdraw his amendment at once, and to apologize to the Chairman for the indiscreet way in which he wrote that communication. (Loud applause.)

The CHAIRMAN said that he was very much obliged to Dr. Fothergill for that expression. It was painful to him to begin his chairmanship of the Representative Body with a collision with a member, especially one so jealous of the rights and privileges of the Representative Body as Dr. Fothergill. At this time particularly it was necessary to emphasize agreements rather than differences. He accepted fully what Dr. Fothergill had said. He could assure Dr. Fothergill that he (the Chairman) was equally jealous of the rights of the representatives.

Mr. E. B. TURNER asked for some guidance as to the nature of the Conference. Was it a fact that it was called simply for consultation, and that it had not the slightest power to determine or alter the policy of the Association?

The CHAIRMAN said that Mr. Turner had correctly stated the position. The Memorandum of Evidence was the Council's document. The Council had been very anxious throughout to take responsibility for the giving of that evidence, but it had equally desired to have the opinion of the profession behind the evidence to be put forward. The programme which it had laid down whereby that evidence was drafted, and then submitted to the widest possible criticism, and finally adjusted in the light of that criticism, was designed with that end in view. The Conference had nothing to do with the policy of the Association. The Representative Body would have a perfectly free hand hereafter. The purpose of the Conference was simply to afford guidance to the Council as to the feeling of the profession.

Dr. FOTHERGILL asked whether the Representative Body as such had a policy with regard to the extension of the Acts to dependants and also with regard to the maternity service, and if, in the course of the Conference, a vote should be taken which negatived this policy, what would be the position of the Council in presenting the evidence?

The CHAIRMAN said that there was no resolution of the Representative Body dealing with the question of dependants. With regard to the maternity service, there was a resolution endorsing a paragraph in a report which was almost exactly on the lines of the paragraph on maternity service in the present Memorandum. That, however, was adopted, not as a special resolution, but as part of a report which was approved. But whatever happened to this evidence, the Association would have a free hand in determining matters of policy, although, no doubt, should the arrangements which had been suggested in evidence be recommended by the Commission as they stood and embodied in an Act of Parliament it would be difficult for the Association to do other than support it; even in that event it would not be technically the policy of the Association. The policy which was to govern a particular situation would have to be decided hereafter. The Royal Commission had to inquire into what, if any, alterations, extensions, and developments might be made in the scheme of National Health Insurance, and this evidence merely stated what the Association considered desirable if it could be obtained. The suggestions were, of course, accompanied by various provisos and conditions, and those who put forward the evidence were in no way committed to any suggested scheme unless it was accompanied by all the provisos and conditions set out.

Dr. J. STEVENS: Will it be within the power of the Association at a future date to change its mind?

The CHAIRMAN: Absolutely.

Mr. TURNER wished to ask the Chairman of Council whether, should the Conference send up decisions contrary to the declared policy of the Association with regard to contract practice, and the Council submitted that as evidence to the Royal Commission, the Council would not be going beyond its powers as a purely executive body. He wished also to ask the Solicitor whether in those circumstances an injunction would lie against the Council. He had a letter from a member who was prepared to ask for an injunction.

The CHAIRMAN OF COUNCIL (Dr. Bolam) thought that the maxim "wait and see" was appropriate in the circumstances. Mr. Turner had supposed a situation which probably would not arise. If it did arise Mr. Turner would be one of the members of the Council who would have to decide on the action to be taken. The Council was bound by the decisions of the Association. If it did not abide by those decisions it took its life in its hands. The Council, however, was not the executive body of the Conference—there must be no mistake about that. The Council was endeavouring to elicit the opinion of the profession throughout the country by taking a new and, he thought, an advisable course of procedure. It would be guided by the opinion of the Conference, but not bound by it in the sense in which it was bound by the opinion of the Representative Body. Mr. Turner might be satisfied that the Council would endeavour to do the statesmanlike thing.

The CHAIRMAN reminded the meeting that the Conference of Local Medical and Panel Committees had its own executive body, the Insurance Acts Committee, fortunately in intimate association with the Council, and the last thing the profession wanted was that the Representative Body should go one way and the Conference of Local Medical and Panel Committees another. That would be a supreme disaster. This would be a Conference representative of the whole profession such as had never been got together before. It was necessary that they should try to see one another's point of view and not stand too much upon technicalities as to the position of the Representative Body on the one hand or of the Panel Conference on the other. He then put the motion authorizing the members of the Representative Body to attend the Conference in association with representatives of Local Medical and Panel Committees to consider the Memorandum of Evidence.

The motion was carried unanimously, and this concluded the business of the Special Representative Meeting, the Conference immediately following, as reported on the previous pages of this issue of the SUPPLEMENT.

## British Medical Association.

### CURRENT NOTES.

#### Fees for the Examination of Emigrants.

WHEN fees for the medical examination of emigrants were arranged after consultation with the officials at the Overseas Settlement Office, it was agreed that the charge should be 10s. 6d. for an adult, and 2s. 6d. for a child under 16 years of age; but in order that the aggregate charge in a case where a family was going overseas should not be too high it was agreed that not more than two children in a family should be charged for. It was believed that all concerned understood that this would mean a maximum charge of 26s. for a man and his wife and children under 16. The following statement in regard to fees was designed to give effect to the agreement:

The fees for the medical examination of migrants should be 10s. 6d. for each person over 16, and 2s. 6d. for each child under 16 years of age, and not more than two children should be charged for in any one family.

The statement is evidently capable of two interpretations. One is that it includes all children whatever their age, the other that it only includes children under 16. Local emigration officers have in some instances insisted that 26s. is the maximum charge for any family with more than two children whatever their age, and refunds of a higher charge have been demanded.

The matter has been brought to the notice of the Chief Medical Officer, and in order to remove all misunderstanding he has promised to have the wording altered so as to read as follows:

- 10s. 6d. for an adult, 16 years of age or over.
- 2s. 6d. for each child under 16 years, provided their parents or guardian are sailing with them.
- Not more than two children under 16 years of age in one family to be charged for.
- Applicants under 16 years proceeding alone will be charged 10s. 6d.

This will make it quite clear that the maximum of 26s. only applies where children under 16 are concerned. Should any difficulty arise before the new forms are issued members of the British Medical Association are requested to communicate at once with the Medical Secretary, who will take the matter up with the Overseas Settlement Office.

## Association Notices.

### SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

#### SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships, as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1925. A Scholar may be reappointed for not more than two additional terms. A Scholar may hold a junior appointment at a University, Medical School, or Hospital provided the duties of such appointment do not interfere with his work as a Scholar.

The conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

#### GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

#### Applications.

Applications for Scholarships and Grants for the year 1925-26 must be made not later than Saturday, June 6th, 1925, on the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated to whom reference may be made.

ALFRED COX,

Medical Secretary.

March 21st, 1925.

### BRANCH AND DIVISION MEETINGS TO BE HELD.

**BIRMINGHAM BRANCH: NUNEATON AND TAMWORTH DIVISION.**—At the meeting of the Nuneaton and Tamworth Division, to be held at the Nuneaton General Hospital on Wednesday, April 1st, Mr. C. A. Raison, F.R.C.S. (Birmingham), will read a paper on the acute abdomen in the child.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, E.8, on Tuesday, April 14th, at 8.30 p.m., when Dr. H. Maclean will read a paper entitled "Diabetes—its treatment: insulin up to date."

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—The Kensington Divisional dance will be held at the Kensington Town Hall on Thursday, May 7th. All money over after expenses have been paid will be handed to the Royal Medical Benevolent Fund and the Royal Medical Benevolent Guild. Further details will appear later, or can be obtained from the Honorary Secretary, 20, Upper Phillimore Place, W.8.

**METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.**—A meeting of the South Middlesex Division will be held at St. John's Hospital, Twickenham, on Wednesday, March 25th, at 8.30 p.m., when Dr. C. E. Herington will open a discussion on the early diagnosis of syphilis.

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, on Friday, April 3rd, at 8.30 p.m., when Dr. A. E. Cow, physician to St. Bartholomew's Hospital, will deliver a British Medical Association Lecture on some recent advances in endocrinology.

**NORFOLK BRANCH.**—A meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital at 3.30 p.m. on Wednesday, April 15th, when an address will be given by Dr. William Norwood East, Chief Medical Officer of H.M. Prisons Commission, on the interpretation of some sexual offences.

**NORTH OF ENGLAND BRANCH: NORTH NORTHUMBERLAND DIVISION.**—A meeting of the North Northumberland Division will be held in the Infirmary, Alnwick, on Tuesday, March 24th, at 3 p.m., when an address, entitled "The early diagnosis of nervous diseases," will be given by Dr. George Hall, and illustrated with special lantern slides. A large attendance of members is hoped for. The business agenda of the meeting will be issued later.

**NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.**—A scientific meeting of the Sunderland Division will be held at Highfield Hospital, Sunderland, on Friday, March 27th, at 7.30 p.m. (not Wednesday, March 25th, as previously announced). Scientific meetings will also be held at the Durham County and Sunderland Eye Infirmary, Sunderland, on Wednesday, April 22nd, at 7.30 p.m., and at the Borough Sanatorium, Hylton Road, Sunderland, on Tuesday, June 23rd, at 3.30 p.m.

**OXFORD AND READING BRANCH: OXFORD DIVISION.**—The next meeting of the Oxford Division will be held at the Radcliffe Infirmary on Wednesday, March 25th, at 2.30 p.m. Clinical cases.—Dr. A. M. H. Gray: The diagnosis and treatment of some common diseases of the skin; Dr. Collier, jun.: The diagnosis of the enteric group by laboratory methods.

**SOUTH WALES AND MONMOUTHSHIRE BRANCH: SWANSEA DIVISION.**—A meeting of the Swansea Division will be held at the General Hospital, Swansea, on Thursday, March 26th, at 8.15 p.m., when a series of short papers will be read.

**SURREY BRANCH: CROYDON DIVISION.**—A meeting of the Croydon Division will be held at the Croydon General Hospital on Tuesday, March 31st, at 8.30 p.m., when Dr. H. W. Barber will deliver an address on the etiology and treatment of some common diseases of the skin.

**SURREY BRANCH: GUILDFORD DIVISION.**—The Guildford Division will hold a clinical meeting in the wards of the Royal Surrey County Hospital, Guildford, on Thursday, April 2nd, at 4 p.m.; ten at 3.45.

**YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.**—A meeting of the Wakefield, Pontefract, and Castleford Division will be held at the Bull Restaurant, Westgate, Wakefield, on Thursday, April 23rd, at 8.30 p.m., when Mr. J. F. Dobson, F.R.C.S. (Leeds), will read a paper on urological diagnosis (illustrated with lantern slides). Supper at 8 o'clock.

### TABLE OF DATES.

Mar. 25, Wed.	Council Meeting
Mar. 30, Mon.	Nomination papers available for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Representatives of Public Health Service.
April 11, Sat.	Annual Report of Council.
April 25, Sat.	Last day for receipt of nominations for election of 24 members of Council by grouped Home Branches, and of 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 9, Sat.	Publication in SUPPLEMENT of nominations for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives. Voting papers posted.
May 12, Tues.	Independent motions for A.R.M. Agenda must be received at Head Office by this date.
May 16, Sat.	Last day for receipt of voting papers for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 30, Sat.	Publication in SUPPLEMENT of results of Council elections by grouped Branches, and of election of members of Public Health Service in Representative Body by Nomination papers available for election of 12 members of Council by grouped Home Representatives must be received by this date.
June 4, Thurs.	Council Meeting
June 10, Wed.	Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.
June 27, Sat.	Supplementary Report of Council appears in SUPPLEMENT.
July 3, Fri.	Amendments and riders for issue in A.R.M. Agenda must be received by this date.
July 17, Fri.	Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.
July 18, Sat.	Annual Representative Meeting, Bath.
July 20, Mon.	Annual Representative Meeting, Bath.
July 21, Tues.	Bath, President's Address.
July 22, Wed.	Council, Meetings of Sections, Conference of Honorary Secretaries, Bath.
July 23, Thurs.	Meetings of Sections, etc., Bath.
July 24, Fri.	Meetings of Sections, etc., Bath.

ALFRED COX, Medical Secretary.

## Meetings of Branches and Divisions.

### NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH: FURNESS DIVISION.

A MEETING, to which all medical men in the Furness area had been invited, was held in the Masonic Hall, Barrow, on March 4th, when Dr. ALEXANDER was in the chair.

The revised draft Memorandum of Evidence to be submitted to the Royal Commission on National Health Insurance was discussed at some length. The decisions of the previous meetings to the answers to the questions were confirmed. The Executive was authorized to hold a joint meeting with the Barrow Panel Committee to consider the agenda of the Conference in London and instruct the representatives thereon.

### YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.

The sixth of the seven monthly lecture meetings, arranged by the Wakefield, Pontefract, and Castleford Division for the present winter session, was held at Wakefield on March 12th, under the chairmanship of Dr. J. J. W. CAMPBELL (Castleford), when, in the unavoidable absence through illness of Mr. E. W. Bain, F.R.C.S. (Leeds), who was to have read a paper on middle-ear suppuration, Dr. P. L. STRICKLAND, bacteriologist to the West Riding County Council, read a paper on the limitations of routine laboratory diagnosis.

Dr. Sutherland pointed out the need for greater appreciation of the limitations of routine laboratory diagnosis, and suggested that this would be helped by a closer association between clinical and laboratory work. He then illustrated his subject by numerous and apt references to diphtheria, tuberculosis, typhoid, and paratyphoid fevers, syphilis, gonorrhoea, urinary and blood examinations, and showed the fallacies which might ensue from a too literal acceptance of reports from laboratories.

The CHAIRMAN, Drs. BUTLER, GIBSON, READER, TWIST, and others took part in the subsequent discussion, and it was agreed that no more important or useful paper had ever been read to the Division.

## GENERAL MEDICAL COUNCIL.

### EXECUTIVE COMMITTEE.

THE minutes of a meeting of the Executive Committee of the General Medical Council held on February 23rd, under the chairmanship of Sir DONALD MACALISTER, have been issued.

### Reciprocity with Italy

The President, who had explained in his address at the last session of the Council (SUPPLEMENT, November 25th, 1924, p. 201) the position with regard to reciprocity with Italy, now reported that the Italian Government had forwarded a draft agreement for the consideration of the British Government, the purport of which was quite satisfactory, though he had suggested some verbal changes. The proposed agreement is that registered medical practitioners holding diplomas issued by licensing bodies in Great Britain, in the Colonies, in India, and in British possessions between which and Great Britain reciprocity exists, may be inscribed on the professional registers of the "Ordini dei Medici" in Italy, and may practise in that country and its colonies without further examination or the necessity for obtaining new qualifications. Similarly practitioners holding diplomas issued by the Italian institutes and legally entitled to carry on practice can be inscribed in the Foreign List of the British Medical Register and practise in Great Britain and in any part of the British Empire where reciprocity exists, again without further examination or new qualifications. It was understood that the agreement will shortly be ratified. The Executive Committee expressed its satisfaction at the approaching successful conclusion to the negotiations.

### Irish Free State Medical Act.

We reported in the JOURNAL of February 21st (p. 383) that the Irish Free State Medical Bill, which provides for the continuance of the existing arrangements for medical registration, had passed through its final stages in the Senate. It has now been passed by both Houses of the Legislature, and on the day on which the Privy Council made a communication on the subject to the General Medical Council (February 21st) was expected to be presented to the Governor of the Free State for signification of the King's assent, so that presumably it is now law. A draft bill will be introduced into the Imperial Parliament on the subject. A copy of the new Irish Act was laid before the Committee. Its title is "An Act to authorize the General Council established by the Medical Acts to continue temporarily to exercise jurisdiction and authority under those Acts in respect of medical practitioners in Saorstát Éireann"—that is, the Irish Free State—and its provisions are as follows:

BE IT ENACTED by the Oireachtas of Saorstát Éireann as follows:  
1. Rights, etc., of Persons Registered and of Registration Authorities under Medical Acts.—(1) All persons registered under the Medical Acts (whether admitted to the register before or after the passing of this Act) shall in Saorstát Éireann have the like

rights, privileges, and immunities and be subject to the like obligations as persons so registered had and were subject to in Ireland prior to the establishment of Saorstát Éireann.

(2) The General Council and its officers shall have and may exercise in relation to persons and matters in Saorstát Éireann all the like powers, jurisdictions, and authorities under the Medical Acts as that Council and its officers prior to the establishment of Saorstát Éireann had and might exercise under those Acts in relation to persons and matters in Ireland.

(3) The Branch Council for Ireland and its officers shall have and may exercise in relation to persons and matters in Saorstát Éireann the like powers, jurisdictions, and authorities under the Medical Acts as that Branch Council and its officers prior to the establishment of Saorstát Éireann had and might exercise under those Acts in relation to persons and matters in Ireland.

**2. Continuance of Constitution of Councils and of Qualifications for Registration.**—(1) The General Council and the Branch Council for Ireland shall respectively continue to be constituted and the members thereof shall continue to be nominated, chosen and elected in like manner as those Councils and members respectively were constituted, nominated, chosen, and elected prior to the establishment of Saorstát Éireann.

(2) Universities and medical corporations in Saorstát Éireann shall continue to have the like powers of granting diplomas and holding qualifying examinations for registration under the Medical Acts as they respectively had prior to the establishment of Saorstát Éireann.

**3. Effects of Medical Acts in Saorstát Éireann.**—The Medical Acts shall have effect in Saorstát Éireann subject to and in accordance with the provisions of this Act.

**4. Short Title, Construction, Citation, and Duration.**—(1) This Act may be cited as the Medical Act, 1925.

(2) This Act shall be construed as one with the Medical Acts, and those Acts and this Act may be cited together as the Medical Acts.

(3) This Act shall continue in force for one year from the passing thereof and shall then expire.

The Committee directed that the Privy Council be informed of its satisfaction that for the time being a solution of the difficulty had been found.

Another Irish matter reported was that the joint committees of the Oireachtas had unanimously refused approval to the preamble of the Apothecaries' Hall (Dublin) Bill, which sought to change the title of licentiate from "Licentiate, Apothecaries' Hall, Dublin," to "Licentiate in Medicine and Surgery, Apothecaries' Hall, Dublin."

#### Conditions of Practice in Greece.

Some time ago a communication was received by the Council from the Greek Minister expressing a desire for the extension of Part II of the Medical Act, 1886, to Greece, and the Greek Legation was asked for information as to the practice of medicine in that country. The Legation had replied that foreign subjects could be registered in Greece subject to the following conditions:

(1) If they belonged to States which admitted Greek doctors into their territories; (2) if they were in possession of the "grade" of doctor from a foreign university of equal qualification to that of the University of Athens. Such a "grade," if granted before September, 1922, was recognized by the University of Athens upon deposit of a small fee, and if obtained after that date it was necessary for the recipient to undergo an examination stipulated by the statute of the university. The qualifications required for Greek subjects to practise in Greece were that, following a five years' course at the Faculty of Medicine, and the obtaining of a relative grade, they must undergo an examination before the General Medical Council of Athens, the body specially authorized by law to grant permission to practise.

The Committee resolved that the information respecting conditions of practice afforded to foreign practitioners in Greece did not afford a suitable basis on which to establish reciprocity in this country.

#### Calcutta University.

Further correspondence was read following the recent decision of the General Medical Council to discontinue the recognition of the M.B. degree of Calcutta University from November last. A remonstrance was forwarded from the university, stating that the governing body had always shown its willingness to fall in with recommendations of the Council concerning the standard of medical education, and that it had never been directly informed that the recognition of the medical degrees of the Indian universities (which came under Part II of the Medical Act) depended on inspections of examinations as laid down in Part I, which applied to examining bodies in the United Kingdom. The General Medical Council was asked to continue to recognize the medical degrees of the university until November next, by which time the revised curriculum would have been adopted in the affiliated medical college, and the necessary alterations made in the regulations for the M.B. degree. The Committee passed a resolution stating its inability to recognize, for the time being, the medical diplomas of the University of Calcutta as furnishing a sufficient guarantee of the possession of the requisite know-

ledge and skill for the efficient practice of medicine, surgery, and midwifery, but that it would welcome and give most careful consideration to any further information on the subject.

#### Medical Council for Ceylon.

It was reported that an ordinance had been passed constituting a Ceylon Medical Council. The work of registration in Ceylon has hitherto been done by the Ceylon Medical College, but it was felt that the college council was not sufficiently representative. The Medical Council is to consist of eleven members—five, including a president, nominated by the Governor, four elected by registered medical practitioners, one by registered dentists, and one by the lecturers of the college.

#### The Midwives Act.

The Committee considered certain new rules, transmitted by the Ministry of Health, involving an extension of the training required for candidates for the examination of the Central Midwives Board.

The principal alterations are that the period of training is to be six months instead of four for trained nurses, and twelve months instead of six for other pupils, and that all pupils are to be required to attend cases both within an institution and in the homes of patients, the first five cases to be attended within the institution. The Committee approved these rules, and, with some qualification, approved some new rules for midwives issued by the Joint Nursing and Midwives Council for Northern Ireland.

#### The Society of Radiographers.

At the previous meeting of the Committee an objection was taken to a proposed alteration in the articles of the Society of Radiographers. It was now reported that a letter had been received from the Institution of Electrical Engineers, at whose instance largely, and with whose assistance, the society was incorporated in 1920. The objection of the Committee was to a proviso at the end of an article which laid down the conditions under which a non-medical member of the society should work; the proviso ran as follows:

"This regulation so far as relates to prohibiting any non-medical member from making any report or diagnosis on any radiograph or screen examination shall not apply to such members of the society on January 1st, 1924, as have been employed in x-ray work for not less than fifteen years prior to that date, the names of such members being embodied in a schedule and entered on the minutes of the society."

It appeared that this proviso was inserted to meet the views of the representatives of the Institution of Electrical Engineers on the society's council, and that the Board of Trade had refused approval because objection had been taken by the General Medical Council. The Institution informed the Council that this proviso was designed to safeguard the interests of a number of well established and successful independent radiographers who for many years had been carrying on radiographic work in private both for doctors and hospitals, and whose business would be destroyed by any general restrictive provision which prevented them from making diagnoses or reports. It had been put in as a compromise, because, in the opinion of the representatives of the Institution, another part of the article would have the effect of reducing the status of non-medical radiographers to that of mere laboratory assistants, and it was desired to exempt from the general restriction those who had had long experience.

The Committee resolved to inform the Institution that it did not desire to make any comments on the subject other than those already submitted to the Board of Trade.

**Other Business.**—Other business which occupied the Committee included the finances of the Council. In 1924 the total income of the General Council was £8,335. The expenditure on fees to members and similar outgoings was £5,348. The English Branch Council received in registration fees £6,789, the Scottish Branch Council £5,104, and the Irish Branch Council £2,308. It was reported that at the forthcoming conference at Brussels to consider the establishment of an International Pharmacopoeial Bureau the British Government would be represented by Sir Nestor Tirard (General Medical Council), Mr. Edmond White (Pharmaceutical Society), and Dr. G. F. McCleary (Ministry of Health), accompanied by Mr. R. D. Hutchinson as technical adviser. In reply to a practitioner who had asked if it was permissible to give an anaesthetic for a rabbi who stated that he held a certificate for performing the rite of circumcision for Jewish children, the President had directed a reply to be sent—which was approved by the Committee—that the practitioner should stipulate that from the surgical point of view the patient should be under his professional supervision so that he might safeguard life and health should the official operation endanger either. A practitioner who had been in the habit of charging 2s. for death certificates had been asked by the Registrar-General to give an assurance that he would cease this practice. He had replied that there was nothing in the Act forbidding the acceptance of a fee, and he refused to give such an undertaking. By the

President's direction—again endorsed by the Committee—an answer was sent in reply to an inquiry that the Council had no jurisdiction to enforce the law, if it was the law, that certificates must be given without fee.

The Committee congratulated Sir Holburt Waring on his knighthood, and thanked him for his good offices in representing the Council at the jubilee celebration of Leeds University.

### DENTAL BOARD.

A MEETING of the Dental Board of the United Kingdom, "in committee of the whole Board," was held on February 10th, under the chairmanship of the Right Hon. F. D. ACLAND.

**Police Notification of Convictions.**—Some correspondence was read with regard to the notification by the police of convictions of medical and dental practitioners. It appeared that a dentist in Scotland had been convicted, but that the conviction had not been officially reported to the Board. The local chief constable, on being communicated with, stated that the instructions from the Secretary for Scotland were that reports should be made to the Board only in cases where fines were imposed. On representations from the Board, the Secretary for Scotland has now issued a new instruction that all convictions of medical and dental practitioners, however trivial, whether a fine is imposed or not, shall be reported to the General Medical Council and the Dental Board respectively. An exception is made in cases where imprisonment follows the conviction, when the notification will, as formerly, be reported by the prison governor. The Ministry of Home Affairs of Northern Ireland has agreed to issue similar instructions to its police. So far as England and Wales are concerned, the Home Office instructions already meet the case.

**Registration Fees and Income Tax.**—A letter was read from the principal Inspector of Taxes stating that instructions had recently been issued by the Board of Inland Revenue to the effect that no objection would be raised to the allowance as an expense in the assessments under Schedules D and E of the statutory fees payable to the Dental Board for general registration, annual retention, or restoration to the Register.

**Minor Dental Work.**—In view of a proposal to make certain alterations in the circular issued by the Board of Education in 1922 dealing with minor dental work in the public dental service by persons not registered dentists, a committee of the Board which had had this matter under consideration met the Ministry of Health and the Board of Education, and strongly deprecated any modification of the terms of the circular. The Board approved this action of its committee.

**Registration.**—It was reported that on January 15th a letter was sent to 513 practitioners who had not paid the annual fee for the retention of their names on the *Dentists Register*, and that at the beginning of February a list of all the names still outstanding was sent to the chief constables with a request to report all cases in which the Act was being contravened. These figures exclude some 239 practitioners resident in the Irish Free State, to whom a special notice has been sent, stating that unless and until they desire to practise in Great Britain or Northern Ireland it is not necessary, so far as the Board is concerned, for them to retain their names on the Register. At the May session, 1924, Mr. Alfred Imrie Lounon applied for registration thirteen months after the expiration of the interim period allowed, his explanation for the delay being that he did not know the Act. The Board refused registration, although it found that in all other respects his application was in order, and Mr. Lounon appealed to the courts, and it was reported that his appeal had been allowed.

**Dentists in the Straits Settlements.**—The first Ordinance passed for the registration of dentists in the Straits Settlements was reported to the Board. It forbids the practice of dentistry within the colony by unregistered persons, and provides for the registration of any person who holds a degree or diploma from any examining body in the British Empire or any foreign country so long as such degree or diploma is recognized by the General Medical Council as registrable.

**Educational Grants.**—Grants of an aggregate amount of £24,300 have been offered to the dental schools by the Board, but, pending fulfilment of the Board's conditions and the necessary preliminary arrangements, no payments have yet been made. The Medical School of Guy's Hospital has intimated its acceptance, on the Board's conditions, of the grant of £5,000 towards the cost of the proposed extension of the Dental School. The University of Leeds had accepted a grant of the same amount towards the cost of a new building for the Dental School. On an intimation that the University College Hospital Medical School is considering the question of improving the Dental School, the Board agreed to consider an application for a grant towards the cost of a comprehensive scheme of improvements in the accommodation and teaching facilities.

## National Insurance.

### THE ROYAL COMMISSION.

THE twenty-first meeting of the Royal Commission on National Health Insurance was held at the Home Office on March 12th, Sir Andrew Duncan in the chair. The National Federation of Rural Approved Societies, represented by Mr. W. Wood and Mr. W. Hyde, gave evidence on the position and experience of rural societies under the insurance scheme. Evidence relating to a particular society—the Scottish Rural Workers' Society—was given by Mr. James Falconer and Mr. Wood. Thereafter Sir Norman Hill, Bt., was examined on the working of the Seamen's National Insurance Society.

Proof copies of the oral evidence and the relative statements submitted at the meeting of February 26th may be obtained from H.M. Stationery Office, Adelphi House, Kingsway, London, W.C.2, on remittance of cost (3s.) and postage.

### NATIONAL INSURANCE INQUIRIES.

#### A FATAL CASE OF DIPHTHERIA.

WE have received this week from the Ministry of Health a set of documents relating to a Committee of Inquiry appointed by the Minister to investigate the professional conduct of a London insurance practitioner, Dr. Z, in respect of his treatment of a male patient, A. B., aged 18, who died of diphtheria on May 5th, 1924.

The complainants were the London Insurance Committee, who charged the respondent, Dr. Z, with gross negligence in that he failed (a) to take a swab of the patient's throat; (b) to diagnose that he was suffering from diphtheria; and (c) to arrange for his removal to hospital as a suspicious case between April 5th and 30th. The complainants alleged that the continuance on the medical list for the County of London of Dr. Z would be prejudicial to the efficiency of the medical service of the insured. The inquiry was held in public on December 19th last. The Committee of Inquiry consisted of a barrister-at-law (chairman) and two medical practitioners. The complainants were represented by counsel and the respondent by a solicitor. The alleged facts of the case and the grounds of complaint were formulated by the complainants in twenty paragraphs, which are included in the Committee's report.

#### Findings of Fact.

The following is a summary of the earlier findings of fact by the Inquiry Committee. The patient, A. B., had on more than one occasion been treated by Dr. Z for septic sore throat. On April 5th, 1924, A. B. attended at Dr. Z's surgery for treatment of a sore throat. He was then suffering from acute follicular tonsillitis, but without any marked fever. Dr. Z prescribed suitable medicine and treatment, visited A. B. at his home on April 7th, 8th, 9th, 11th, 14th, 15th, 16th, 17th, 19th, 21st, 23rd, 25th, 26th, and continued to treat him for tonsillitis, and issued certificates to that effect. On April 9th there were signs of a broken quinsy. The Committee continues:

"At some date in the middle of April which it is impossible to fix with certainty, but which from the condition of the deceased when he was removed to hospital may be placed on April 12th, or a few days thereafter, the deceased was attacked by diphtheria. On April 14th he had one single attack of nasal haemorrhage, and on the night of that day suffered from regurgitation in an attempt to take some liquid food, and on two subsequent days suffered the same experience. These symptoms were made known to the respondent. During the earlier part of the illness the deceased's throat was extremely swollen and painful. From about April 15th onward his speech was affected. On or about April 21st the deceased suffered from pains in his chest. During the first three weeks of the illness there were signs of a white or yellow-white patch on one or other side of the throat internally. The temperature of the deceased never rose much, although on April 18th the respondent found a temperature of 100° or 101°. The respondent tested for the possibility of paralysis of the soft palate on more than one occasion.

"At some of the symptoms indicated the being present, the respondent continued to follicular tonsillitis, and regarded the condition of the deceased as improving. On April 26th, at his visit, the respondent recommended a change of air, and permitted the deceased to be out of bed on the three succeeding days. The deceased had then no temperature. The respondent viewed the difficulty of speech and the regurgitation as due to spasm produced by the tonsillitis. In fact, the condition of the deceased was not improving, and he was worse during the days April 26th-29th, and was seriously ill when he visited the respondent's surgery on April 30th. On that day the respondent diagnosed the case as probably one of diphtheria, mainly owing to a test of the soft palate, which showed signs of paralysis. His suspicion of diphtheria was heightened by a suggestion of the mother of the deceased, who accompanied her son to the surgery, to the effect that the illness might be due to diphtheria.

"Following upon this diagnosis the respondent gave the necessary certificate for diphtheria, which enabled the removal of the deceased

to the Eastern Hospital at Homerton. The deceased was then in a comparatively advanced stage of the disease, and died from its effect, coupled with that of Vincent's angina, which had probably supervened towards the end of April.

"It is not possible in practice for a doctor to arrange for the removal to a diphtheria hospital of 'a case of suspicion.' Before a patient can be so removed the doctor must give a definite certificate of diphtheria.

"The respondent did not throughout the period of his treatment take a swab of the throat for the purpose of ascertaining whether or not diphtheria was at any time present. The respondent did not, until April 30th, suspect diphtheria, but adhered until that date to his original diagnosis of follicular tonsillitis. The respondent was not averse in his ordinary practice to the taking of swabs or to the serum treatment in cases of suspected or proved diphtheria."

#### Observations by the Committee.

Before submitting its inferences of fact the Committee of Inquiry says that it thinks it right to offer the following observations:

"We were enabled to view the whole case in the light of expert evidence bearing both upon the possibility of a correct diagnosis in the earlier stages of the illness and the possible result of an incorrect diagnosis.

"When a charge of gross negligence is made against a doctor it seems just to avoid an attitude of mind which—to use a colloquial phrase—savours of being wise after the event, and not to attach undue weight to the death of the patient with the obvious exception of cases in which the death can be proved to be attributable to such negligence.

"Evidence was adduced as to conversations between the mother of the deceased and the respondent as to the insistence by the respondent throughout that the illness was not caused by diphtheria, although some of the symptoms were consistent with that disease. We formed the opinion that as a matter of fact the respondent never suspected diphtheria until April 30th, and our findings of fact expressed . . . above seem to render specific findings of fact as to those conversations unnecessary."

#### Inferences of Fact.

The Committee submits the following inferences of fact:

- (i) The respondent probably regarded the deceased as a person liable to suffer from a septic form of sore throat, and was influenced in forming this opinion by the fact that he had on two previous occasions attended the deceased for acute follicular tonsillitis.
- (ii) The respondent was correct in his original diagnosis of follicular tonsillitis. In so far as he was guilty of any failure to diagnose the subsequent onset of diphtheria, the case was one in which such onset may well have been masked by the presence of tonsillitis and the further complication of Vincent's angina.
- (iii) It is impossible to state with certainty whether a swab taken at the appropriate time would have given a sure indication of the presence of diphtheria, but we can only describe the fact as unfortunate that the respondent, in his persistent diagnosis of tonsillitis, did not adopt this further test for the purpose of checking his opinion.
- (iv) Apart from any question as to the degree of skill possessed by the respondent, no possible suggestion can be made against the respondent for any neglect in attendance. It was clear from the evidence that, even assuming his failure until April 30th to detect the presence of diphtheria, he exercised great care in the case, as is shown *inter alia* by the number of visits which he paid.
- (v) It is impossible to hold that the death of the deceased was due to negligence on the part of the respondent—that is, to the exclusion of other possible causes.
- (vi) We observe from the form of the representation that the charge relates only to the conduct of the respondent with respect to one case.

"In our opinion," the Committee concludes, "the charge of gross negligence wholly fails. The facts indicate the possibility of criticism of the respondent in the matter of his professional skill, but an illness which commences with tonsillitis and is complicated by the subsequent onset of diphtheria and Vincent's angina is probably not of common experience and adds to the difficulty of making a correct diagnosis. We think that the complainants were not justified in making their representation and thus putting in motion the machinery which involved the inquiry heard by us. In pursuance of this view we recommend that the complainants be ordered to pay to the respondent his taxed costs of the inquiry."

#### The Minister's Decision.

The formal document conveying the Minister of Health's decision states that the Minister has decided not to remove Dr. Z's name from the list of the London Insurance Committee, and directs that Dr. Z's costs in connexion with the inquiry (to be taxed as between party and party) shall be paid by the Insurance Committee. A letter from the Minister, addressed to the London Insurance Committee, contains the following observations:

"While the findings contained in the report do not justify the conclusion that the practitioner's continuance on the list would be prejudicial to the efficiency of the service, the Minister has felt bound to consider whether the standard of treatment provided by the practitioner in the case in question was such as an insurance practitioner may reasonably be expected to provide for his patients.

"The Minister is advised that some of the symptoms from which, according to the report of the Inquiry Committee, this patient suffered, were such as should have suggested the presence of diphtheria to any practitioner exercising a reasonable degree of care and skill in his attendance on the patient with sufficient force to make it incumbent upon him to take such steps as were reasonably open to him to ascertain whether he was justified in his view that the case was not one of diphtheria. The Minister is therefore of the opinion that Dr. Z, in omitting to take such steps, failed to take precautions which any reasonably prudent medical practitioner would have taken.

"The Minister is therefore in agreement with the original recommendation of the Medical Service Subcommittee, that a substantial deduction should be made from the practitioner's remuneration. He has accordingly decided that £20 must be withheld from the money payable to the Insurance Committee in respect of medical benefit. This sum should, in accordance with Article 36 of the Medical Benefit Regulations, be recovered from Dr. Z by deduction from his remuneration."

## Naval and Military Appointments.

### ROYAL NAVAL MEDICAL SERVICE.

**Surgeon Captain R. W. G. STEWART, O.B.E.,** to R.N. Hospital, Plymouth.  
**Surgeon Lieutenant J. A. E. TANNIAN** to the *Cricketer* (appointment to the *Mantis* cancelled).

### ROYAL ARMY MEDICAL CORPS.

**Major and Brevet Lieutenant-Colonel C. W. HOLDEN, C.M.G., D.S.O.,** to be Colonel J. Dorgan, to retired pay.  
"T. V. OLHAM, receiving a gratuity, and  
"G. DRESSING, M.C., receiving a gratuity;  
**J. B. WILLIAMSON** on account of ill health.

### ROYAL AIR FORCE MEDICAL SERVICE.

**Group Captain H. COOPER, D.S.O.,** to Headquarters, Inland Area.  
**Group Captain N. J. ROOPE, O.B.E.,** is placed on half-pay, Scale A.  
**Flight Lieutenant A. F. ROOK** is promoted to the rank of Squadron Leader. **Flight Lieutenant P. A. HALL** to No. 1 School of Technical Training (Boys), Halton.  
**Flying Officer L. C. PALMER-JONES** to No. 1 School of Technical Training (Boys), Halton.

### REGULAR ARMY RESERVE OF OFFICERS.

#### ROYAL ARMY MEDICAL CORPS.

**H. L. Oldershaw** to be Lieutenant.

### TERRITORIAL ARMY.

#### ROYAL ARMY MEDICAL CORPS.

**Second Lieutenant K. V. MILBURN** (late R.F.A., T.F.) to be Lieutenant.

### TERRITORIAL ARMY RESERVE OF OFFICERS.

#### ROYAL ARMY MEDICAL CORPS.

**1st London Field Ambulance.**—The announcement regarding Captain (now Major) D. S. Sutherland, which appeared in the *London Gazette* of December 30th, 1918, is cancelled.

### COLONIAL MEDICAL SERVICES.

**Dr. H. C. E. QUIN** appointed M.O.H., Medical Department, Gold Coast.  
**Dr. F. McGarth** appointed M.O., Nigeria. **Dr. J. M. Semple**, Medical Officer, transferred from Tanganyika to Zanzibar.

## VACANCIES.

**BELFAST:** MAIER INFIRMARY HOSPITAL.—Honorary Assistant Gynaecologist.  
**BELGRAVE HOSPITAL FOR CHILDREN,** Clapham Road, S.W.9.—(1) House-Physician. (2) House-Surgeon. (3) Assistant House-Physician. (Males.) Salary at the rate of £100 per annum each.

**BRIDGE OF WEIR:** CONSUMPTION SANATORIUM OF SCOTLAND.—Resident Medical Officer. Salary at the rate of £200-£250 per annum.

**BRITISH GUJANA:** Assistant Medical Officer. Salary £500 per annum, rising to £700.

**BROMLEY BOROUGH:** Medical Officer of Health. Salary £800 per annum.  
**EDINBURGH:** ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN.—Vacancy on the Surgical Staff.

**EVELINA HOSPITAL FOR CHILDREN,** Southwark, S.E.1.—House-Surgeon (male). Salary at the rate of £120 per annum.

**EXETER:** ROYAL DEVON AND EXETER HOSPITAL.—Assistant House-Surgeon. Salary at the rate of £150 per annum.

**FOLKESTONE:** ROYAL VICTORIA HOSPITAL.—Resident Medical Officer. Salary at the rate of £150 per annum.

**KERTFORSBURGH COUNTY SANATORIUM,** Ware Park.—Matron. Salary £140 per annum, rising to £170.

**HOSPITAL FOR SICK CHILDREN,** Great Ormond Street, W.C.1.—(1) House-Surgeon. (2) House-Physician and Assistant Casualty Officer. Salary £50 per annum each.

**HULL AND GOOLE PORT SANITARY AUTHORITY.**—Assistant Medical Officer of Health. Salary £750 per annum.

**HULL ROYAL INFIRMARY.**—Assistant House-Surgeon (male). Salary £150 per annum.

**JOHANNESBURG:** UNIVERSITY OF WITWATERSRAND.—Senior Lecturer in Dental Anatomy, Physiology, and Histology. Salary £450 per annum, rising to £650, plus relative local allowance.

**LEDS CITY:** Assistant Medical Officer for Maternity and Child Welfare. Salary £600 per annum.

**LEICESTER ROYAL INFIRMARY.**—House-Surgeon. Salary at the rate of £125 per annum.

LIVERPOOL COUNTY BOROUGH.—Three Junior Assistant School Medical Officers. Salary £600 per annum each.

LIVERPOOL SANATORIUM, Delamere Forest, Frodsham.—Assistant Medical Officer. Salary £200 per annum.

LONDON HOMOEOPATHIC HOSPITAL, Great Ormond Street, W.C.1.—Third Anaesthetist. Honorarium £50 per annum.

LONDON LOCK HOSPITAL, Dean Street, W.—Surgical Registrar to the Male Lock Hospital. Honorarium £100 per annum.

MAIDSTONE: WEST KENT GENERAL HOSPITAL.—House-Surgeon (male). Salary at the rate of £220 per annum.

MILDMAY MEDICAL MISSION.—Dental Surgeon to Out-patients.

MINISTRY OF HEALTH.—Deputy Regional Medical Officers (twelve for England and one for Wales). Remuneration £800 per annum, rising to £1,100.

NATIONAL SANATORIUM, Benenden, Kent.—Resident Assistant Medical Officer (male). Salary £300 per annum, rising to £350.

NEWCASTLE-UPON-TYNE: ROYAL VICTORIA INFIRMARY.—(1) Four House-Physicians. (2) Six House-Surgeons. (3) Junior House-Surgeons. (4) Departments. (5) House-Surgeon to Skin and V. (6) House-Surgeon to Out-patient Dressing Department. Residents remunerated at the rate of £50 per annum.

PADDINGTON GREEN CHILDREN'S HOSPITAL, W.2.—(1) House-Physician. (2) House-Surgeon. Salary £150 per annum each.

PRINCE OF WALES'S GENERAL HOSPITAL, Tottenham, N.15.—(1) House-Surgeon. (2) Special House-Surgeon. (3) House-Physician. (4) Junior House-Surgeon. (5) Junior House-Physician. Salary for (1), (2), and (3) £150 per annum, and for (4) and (5) £110 per annum.

POTLEY HOSPITAL, S.W.15.—Resident Medical Officer (male). Salary £150 per annum.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E.2.—(1) Resident Medical Officer; salary £200 per annum. (2) House-Surgeon; salary £100 per annum.

QUEEN MARY'S HOSPITAL FOR THE EAST END, Stratford, E.15.—Honorary Assistant Physician.

ROTHESMAN CORRY BOROUGH.—Assistant Medical Officer of Health (male). Salary £650 per annum.

ROYAL CHEST HOSPITAL, City Road, E.C.1.—Physician with charge of Out-patients.

ROYAL ELSWOOD INSTITUTION, Redhill.—Junior Assistant Medical Officer (male, unmarried). Salary at the rate of £250 per annum.

St. PANCRA'S DISPENSARY, 39, Oakley Square, N.W.1.—Honorary Physician.

St. VINCENT'S ORTHOPAEDIC HOSPITAL, Eastcote, Pinner.—Resident Medical Officer (male). Salary £150 per annum.

STREWSBURY: ROYAL SALOP INFIRMARY.—House-Physician (male). Salary at the rate of £160 per annum.

SUVA.—Medical Officer of Health. Salary £750 per annum, rising to £900.

WALLASEY: VICTORIA CENTRAL HOSPITAL.—Honorary Assistant Ophthalmic Surgeon.

WEST AFRICAN MEDICAL SERVICE.—Medical Officers. Initial salary £660 a year.

WEST DERBY HOSPITAL.—Resident Assistant Medical Officer at the Mill Road Infirmary, Liverpool. Salary £200 per annum.

WILKINSHIRE: ROYAL HAMPSHIRE COUNTY HOSPITAL.—Sister Tutor. Salary £150 per annum, rising to £160.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Horncastle (Lincoln), Nelson (Glamorgan).

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column advertisements must be received not later than the first post on Tuesday morning.

## DIARY OF SOCIETIES AND LECTURES.

### ROYAL SOCIETY OF MEDICINE.

Mon., 5.30 p.m., Resumed Discussion: Non-specific Disturbances of Health due to Vitamin Deficiency. Speakers: Dr. William Hunter, Dr. Robert Hutchison, and others.

Section of Ontology: Mon., 8 p.m., Mr. G. J. Harbrow: A Dental Cyst in connexion with a Deciduous Tooth; Mr. A. Livingston: The Permeability of Enamel.

Sections of Surgery, Medicine, and Pathology: Tues., 8 p.m., Special Discussion: The Treatment of Septicæmia. Openers: Sir Thomas Horder, Mr. E. P. Rowlands, and Dr. L. Colbrook.

Section of Comparative Medicine: Wed., 5 p.m., Sir Stewart Stockman: Some Problems of Foot-and-mouth Disease.

Section of Epidemiology and State Medicine: Thurs., 5.30 p.m., Dr. W. L. Burgess (M.O.H. Dundee): An Outbreak of Food Poisoning.

Section of Orology: Thurs., 8.30 p.m., Clinical and Pathological Evening.

Section of Study of Disease in Children: Fri., 4.30 p.m., Clinical Meeting at the National Hospital for the Paralysed and Epileptic, Queen Square, W.C.1. Cases will be shown.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.1.—Tues., 5 p.m., Third Lecture: Gastric Disease. Thurs., 5 p.m., Luncheon On Some Forms of Vomiting in Infancy.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.1.—Fri., 5 p.m., Sir Arthur Keith: Museum Demonstration of Specimens illustrating the Commoner Congenital Malformations of the Lower Limb.

HARVEY SOCIETY OF LONDON, Town Hall, Finsbury Green, W.—Thurs., 8.30 p.m., Discussion: Obstruction of the Colon; to be opened by Sir Lockhart-Mummery. Mr. Gordon-Taylor, Dr. Montague Smith, and others.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 8.30 p.m., Discussion: Oxaluria; to be introduced by Mr. L. Battle Rawling, followed by Sir William Wilcox and others.

### POST-GRADUATE COURSES AND LECTURES.

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL, Gray's Inn Road, W.C.1.—Fri., 4 p.m., Muscularity of the Larynx.

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION, 1, Wimpole Street, W.1.—Brompton Hospital for Diseases of the Chest: Second week as per syllabus. Central London Ophthalmic Hospital, Judd Street, W.C.1. Lecture Demonstrations in Diseases of the Eye,

daily from 2.30 p.m. North-Eastern Fever Hospital, St. Ann's Road, Tottenham: Wed and Sat., 11 a.m., Demonstrations in Treatment of Acute Infectious Diseases. Royal Northern Hospital, Holloway Road, N.7: Intensive Course. Chelsea Hospital for Women: Special Course; mostly afternoon work.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—Thurs., 4 p.m., Chief Palace.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Mon., Tues., Thurs., and Fri., 2 p.m., Out-patient Clinics. Mon., 12 noon, Reflexes; 3.30 p.m., Syphilis of the Nervous System. Tues., 3.30 p.m., Disseminated Sclerosis. Wed., 3.30 p.m., The Oculomotor Nerve. Thurs., 12 noon, Inflammatory Reactions in the Central Nervous System; 3.30 p.m., Cerebral Disease. Fri., 3.30 p.m., Demonstration of Physical Exercises. Operations, Tues. and Fri., 9 a.m.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Daily: In-patient and Out-patient Clinics, Operations, Clinics in Special Departments. Lectures and Demonstrations: Tues., 5 p.m., Treatment of the Toxæmia of Pregnancy. Fri., 4.30 p.m., Some Common Dermatoses of Children.

## British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

### Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded if desired, on application to the Librarian, accompanied by £1 for each volume for postage and packing.

### Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager): Telegrams: Articulate Westrand, London.

MEMBER SECRETARY (Telegrams: Medicebra Westrand, London).

EDITOR, *British Medical Journal* (Telegrams: Altiology Westrand, London).

Telephone number for all departments: Gerrard 2539 (3 lines).

SCOTTISH MEMBER SECRETARY: 4, Portland Square, Edinburgh (Telegrams: el: 4561 Central).

IRISH MEMBER SECRETARY: Frederick Street, Dublin (Telegrams: 4737 Dublin).

### Diary of the Association.

#### MARCH.

- 20 Fri. London: Routine Clinical Pathological Work Subcommittee, 2.30 p.m.
- 24 Tues. North Northumberland Division: Infirmary, Alnwick. Address by Dr. George Hall on the Early Diagnosis of Nervous Diseases, 3 p.m.
- 25 Wed. London: Council, 10 a.m. Oxford Division: Radcliffe Infirmary. Clinical Cases, 2.30 p.m. South Middlesex Division: St. John's Hospital, Twickenham. Discussion on Early Diagnosis of Syphilis, to be opened by Dr. C. E. Herington, 8.30 p.m.
- 26 Thurs. Swansea Division: General Hospital, Swansea, 8.15 p.m.
- 27 Fri. Sunderland Division: Scientific Meeting, Highfield Hospital, Sunderland, 7.30 p.m.
- 31 Tues. Croydon Division: Croydon General Hospital. Address by Dr. H. W. Barber on The Etiology and Treatment of Some Common Diseases of the Skin, 8.30 p.m.

#### APRIL.

- 1 Wed. Nuneaton and Tamworth Division: Nuneaton General Hospital. Paper by Mr. C. A. Reason on the Acute Abdomen (a la Child).
- 2 Thurs. Guildford Division: Clinical Meeting, Royal Surrey County Hospital, Guildford, 4 p.m.
- 3 Fri. Chesterfield Division: Maternity Hospital, Chesterfield. B.M.A. Lecture on Some Recent Advances in Endocrinology by Dr. A. E. Gow, 8.30 p.m.
- 14 Tues. City Division: Metropolitan Hospital, Kingsland Road, E.8. Paper by Dr. H. Maclean on Diabetes—its Treatment: Insulin up to Date, 9.30 p.m.
- 15 Wed. Norfolk Branch: Norfolk and Norwich Hospital. Address by Dr. W. Norwood East on the Interpretation of Some Sexual Offences, 5.30 p.m.
- 23 Thurs. ... Castleford Division: Bull Restaurant, Paper by Mr. J. F. Dobson on 30 p.m. Supper, 8 p.m.
- 7 Thurs. Kensington Division: Divisional Dance, Kensington Town Hall.

SOUTH-WEST LONDON POST-GRADUATE ASSOCIATION, St. James's Hospital, Ouseley Road, Balham, S.W.12.—Wed., 4 p.m., Demonstration of Medical Cases.

WEST LONDON HOSPITAL POST-GRADUATE COLLEGE.—W.—Mon., 12 noon, Applied Anatomy. Tues., 2 p.m., 2 p.m., Medical Wards. Thurs., 2 p.m., Fri., 10.30 a.m., Skin Department. Sat., Children. Daily 10 a.m. to 6 p.m., Sat. 10 a.m. to 1 p.m., In-patient patients, Operations, Special Departments.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION.—At Royal Infirmary: Wed., 4.15 p.m., Medical Cases.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.15 p.m., Drugs of Power. Fri., 4.15 p.m., Electro-cardiographic Demonstration; Surgical Cases.

## BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcement of Births, Marriages, and Deaths is 2s., which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

### BIRTH.

CURRIE.—At Kelowna Nursing Home, Colwyn Bay, on March 16th, the wife of Donald I. Currie, M.B., F.R.C.S., a son, (James).

### SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

#### SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships, as follows:

1. AN ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1925. A Scholar may be reappointed for not more than two additional terms. A Scholar may hold a junior appointment at a University, Medical School, or Hospital provided the duties of such appointment do not interfere with his work as a Scholar.

The conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

#### GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

#### Applications.

Applications for Scholarships and Grants for the year 1925-26 must be made not later than Saturday, June 6th, 1925, on the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated to whom reference may be made.

ALFRED COX,  
Medical Secretary.

March 21st, 1925.

### National Insurance.

#### THE ROYAL COMMISSION.

THE twenty-second meeting of the Royal Commission on National Health Insurance was held at the Home Office on March 19th, Sir Andrew Duncan in the chair. The examination of Sir Norman Hill, Bt., on the working of the Seamen's National Insurance Society was resumed, and at its conclusion he gave evidence as to the Special Fund for Seamen. Thereafter the Insurance Committees of Coventry (Mr. H. W. Vale and Mr. Lee Gordon), Cheshire (Mr. G. Wright and Mr. F. T. West), and Leicestershire (Alderman Goodacre and Mr. T. Crew) gave evidence on the constitution and administrative work of Insurance Committees, particularly with reference to the medical and treatment benefits.

Proof copies of the oral evidence and the relative statements submitted at the meeting of March 5th may be obtained from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, on remittance of cost (2s. 3d.) and postage.

### Correspondence.

#### The Joint Conference and the Capitation Fee.

SIR.—There were at the Conference (reported in the SUPPLEMENT of March 21st) such a number desirous to speak, and so little inclination to hear them, that I curbed my own desire to take a part. Therefore I would now add a few comments. I was one of the few who opposed to the last possible moment the fatal strike of 1913, and in listening to the debate on March 12th I could not but recall old arguments. For instance, Mr. Turner would have us believe that dependants would take at a minimum five times the attendances required at present, and he hinted at twenty-five times this number. In 1912 Dr. Lowry, in a pamphlet which attracted considerable notice, predicted 18 attendances per insured person per annum. The Council of the British Medical Association predicted 5.3. I, on the other hand, observing that there was already considerable, and in many places gross, overattendance in clubs, ventured, at a big meeting at Worthing, to reject both figures, and prophesied that attendances would not exceed 4, and would probably be about 3.75, the average of private clubs; and it was so.

Addressing myself to the present problem, the only published figures I know of dealing with attendances in private practice, mainly among industrial classes, and including women and children, are those of the Plender report. The average attendance per head per annum in the five towns investigated was 1.48. Bearing this in mind, and noting also the fact that a large proportion of the present National Health Insurance attendances are purely for the purpose of obtaining sickness benefit, which will not be given to dependants, I would predict that the attendances on dependants per head per annum will certainly not exceed 2 in rural areas, where children are under healthy conditions, 3.5 in average urban areas, and 6 in slums.

It was most unfortunate, and I do not know to whom the blame attaches, that the paramount question as to whether priority should be given to providing a complete service or to including dependants was never discussed at all, and no instruction has been given to the Council on this essential point. The opinion of the constituencies was, however, clearly in favour of a complete service first, and I trust that the Council will strongly emphasize this. In this respect I am in agreement with Dr. Skene. Yet it influenced me to vote against him, for it has an immense influence upon the problem in debate. Hitherto successive Chancellors of the Exchequer have refused a complete service, solely on the score of expense. Further, so far as I have followed evidence before the Royal Commission, there is no strong desire among approved societies or their members to include dependants, but a very strong disinclination to increase contributions. Therefore, it seems likely that, if a complete service is first guaranteed, so little money will be left for other purposes that the number of dependants to whom such complete service can be extended will be very limited indeed, and so far from all sorts of pressure being brought to bear to include the maximum number, every kind of influence will be exerted to ensure that the number be a minimum, and therefore none of those fears which exercise the minds of Mr. Turner and his supporters are likely to materialize. As regards the opinions expressed by Dr. Larking, I am with him whole-heartedly. I consider the removal of the present objectionable despotism as of first-class importance, and it seems to me that here is an excellent opportunity to press for it. We can say it will be impossible to include dependants

unless this tyranny is removed. If, on the other hand, we decline, as he recommends, to accept any dependants, we throw away our principal weapon for the achievement of his own end.

I wish to supplement the two letters of the Scottish Medical Secretary on the subject of capitation (SUPPLEMENT, February 28th, p. 81, and March 14th, p. 102). It has never been explained how the grave loss introduced by the ever steadily increasing number of disablement benefit cases, for whom no money was paid into the medical pool, is got over. The original explanation offered—that the loss was balanced by other gains—was patently inadmissible, for there is no gain having the same progressive character, and one of the alleged gains was really a loss. As far as I can ascertain, from evidence before the Royal Commission, some additional returns are now extracted from approved societies to furnish the necessary information to the actuary, but the matter is distinctly obscure. Perhaps Dr. Drever can throw light upon it. I would point out, in addition, that whether a district gets more or less than the full capitation depends on several factors. Most, as a matter of fact, get more. The more accurate the work of the Insurance Committee office in keeping its registers compared with the returns from the Central Index Committee, and so reducing inflation, and the fewer demands for temporary residents, anaesthetics, and emergencies, the larger the capitation, and conversely. Again, the greater the effort made to secure allocation to doctors of all the insured, and the smaller the residue of unallocated who swell the capitation, the smaller the capitation will be.

Districts where the capitation is unduly small should look to the office work of their Committee, and should also try to curtail demands for anaesthetics and the like. Districts where the capitation is unduly large should try to speed up the allocation of the unallocated, as the gain under this head is not fairly distributed. Moreover, inasmuch as no payment for drugs is attached, the presence of a large unallocated residue in a rural area inflicts a definite hardship and injustice on those doctors who dispense, and who should receive payment for drugs for all persons, allocated or otherwise, for whom they are, in fact, responsible when they are ill, just as payment for treatment is made for all alike.—I am, etc.,

Chichester, March 23rd.

G. C. GARRATT.

#### Insurance Remuneration.

SIR,—With reference to the letters of Dr. Ian D. Grant and the remarks of Dr. J. R. Drever (Scottish Medical Secretary) published in the SUPPLEMENT of February 28th and March 14th, it is impossible for Dr. Grant, or any other practitioner in a capitation area, to furnish many specific instances of persons treated who have, in point of fact, ceased to be entitled to medical benefit, inasmuch as practitioners are not notified by the Insurance Committees of the actual dates upon which insured persons so cease, or have ceased, when applying for the return of the appropriate medical record cards. Under the Medical Benefit Regulations the deletion of an insured person's name from a doctor's list takes effect as from the date specified on the Insurance Committee's notice, or from such other date, not being earlier than that date, as may be specified thereon; and this date does not necessarily coincide with the date the person actually ceases, or has ceased, to be entitled to medical benefit.

Under the Manchester system of medical benefit all the medical record cards of practitioners in the area are kept in a central office maintained by the Panel Committee, and the actual dates insured persons cease, or have ceased, to be entitled to medical benefit are notified by the Insurance Committee, thus enabling the Manchester Panel Committee to be in a position to furnish specific cases of persons who have received treatment although not entitled thereto.

One would like to know what use Dr. Drever has made of the following number of specific instances of persons who have received treatment in the Manchester area after ceasing to be entitled to medical benefit, which have been at his disposal for some years, and to ask what useful service Dr. Grant would be doing by furnishing a few isolated cases, which, indeed, he is obviously unable to do for the reasons stated above.

Year.	No. of Specific Cases.
1921 (last two quarters) ... ..	252
1922 (first three quarters) ... ..	758
1923 ... ..	1,290
1924 (first three quarters) ... ..	796

In the majority of the above cases the cause is due to the delay (varying from a few days to eight years) on the part of approved societies in notifying the Insurance Committee of the suspension of their members from medical benefit.

Three examples of these cases are as follows:

Insured Persons.	Date Ceased to be Entitled to Medical Benefit.	Date Notification Received by Insurance Committee.
A. B. ... ..	April 13th, 1913	July 14th, 1921.
C. D. ... ..	December 31st, 1915	May 24th, 1921.
E. F. ... ..	December 31st, 1918	January 12th, 1922.

(There is actual evidence of the patients receiving treatment in 1921.)

Under the Manchester system of payment per attendance the risk involved is carried by the practitioners as a whole, and not by individual doctors as in a capitation area. The question of procedure in connexion with the suspension of persons from medical benefit and its effectiveness calls for very serious consideration, as all areas are affected, and it is doubtful to see any practical outcome of this correspondence unless the Insurance Acts Committee can induce the Minister of Health to arrange for the penalization of those approved societies who fail to carry out their statutory duties efficiently. As matters stand at present it seems to be a cardinal feature of the Insurance Acts that only panel doctors must be penalized.

The immediate suggestion I would make is that every Insurance Committee should state, on the notice to practitioners requesting the return of medical record cards, the actual dates insured persons cease, or have ceased, to be entitled to medical benefit. This could be done in every insurance area without any difficulty, and the practitioners would then be in a position to see to what extent treatment (if any) has been given subsequent to date of suspension.—I am, etc.,

JNO. D'EWRANT,  
Honorary Treasurer, Manchester Medical  
and Panel Committee.

Manchester, March 17th.

#### Association Notices.

##### BRANCH AND DIVISION MEETINGS TO BE HELD.

BATH AND BRISTOL BRANCH.—A meeting of the Bath and Bristol Branch will be held at the Cottage Hospital, Wells, on Wednesday, April 8th, at 3.30 p.m., when Dr. W. A. Bond will give a British Medical Association Lecture on the legal obligations of the medical man. Tea will be provided.

BIRMINGHAM BRANCH: NUNTON AND TANWORTH DIVISION.—At the meeting of the Nunton and Tanworth Division, to be held at the Nunton General Hospital on Wednesday, April 1st, Mr. C. A. Raison, F.R.C.S. (Birmingham), will read a paper on the acute abdomen in the child.

BIRMINGHAM BRANCH: WEST BROMWICH DIVISION.—The second regular meeting for 1925 of the West Bromwich Division will be held at the District Hospital, West Bromwich, on Wednesday, April 1st, at 8 p.m. Agenda: (1) To form a Local Hospitals Committee. (2) At 8.30 p.m. Mr. Herbert Potter, F.R.M.S., will give an informal chat on marine zoology, and will illustrate his address with his microprojector.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, E.8, on Tuesday, April 14th, at 9.30 p.m., when Dr. H. Maclean will read a paper entitled "Diabetes—its treatment: insulin up to date."

METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.—A general meeting of the Kensington Division will be held on Thursday, April 23rd, at the Kensington Palace Mansions Hotel, De Vere Gardens, W.8, at 8.45 p.m. An address will be given by Dr. Seymour Taylor, consulting physician to the West London Hospital, entitled "Some medical aphorisms."

METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.—A meeting of the South Middlesex Division will be held at St. John's Hospital, Twickenham, on Wednesday, April 15th, at 8.15 p.m., for general business. At 8.30 p.m. Dr. H. C. Corry Mann, O.B.E., will read a paper on dietary during the school age.

MIDLAND BRANCH: CHESTERFIELD DIVISION.—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, on Friday, April 3rd, at 8.30 p.m., when Dr. A. E. Gow, physician to St. Bartholomew's Hospital, will deliver a British Medical Association Lecture on some recent advances in endocrinology.

NORFOLK BRANCH.—A meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital at 3.30 p.m. on Wednesday, April 15th, when an address will be given by Dr. William Norwood East, Chief Medical Officer of H.M. Prisons Commission, on the interpretation of some sexual offences.

NORFOLK BRANCH: NORWICH DIVISION.—A meeting of the Norwich Division will be held to-day (Friday, March 27th) in the Medical Library, at 8.30 p.m. Agenda: To receive reports of (a) the Dinner Committee; (b) the Representative to the Special Representative Meeting held in London on March 12th; and (c) the Executive Committee.

**LIVERPOOL COUNTY BOROUGH.**—Three Junior Assistant-School Medical Officers. Salary £600 per annum each

LIVERPOOL EYE AND EAR INFIRMARY.—House-Surgeon (male) Salary £100 per annum.

MANCHESTER AND DISTRICT RADIUM INSTITUTE.—Assistant Radiologist. Salary £500 per annum.

MANCHESTER ROYAL INFIRMARY.—Assistant Resident Surgical Officer. Salary at the rate of £200 per annum.

MINISTRY OF HEALTH.—Deputy Regional Medical Officers (twelve for England and one for Wales).—Remuneration £800 per annum, rising to £1,200.

MINISTRY OF PENSIONS.—Senior Resident Medical Officer at the Highday Group of Hospitals, Birmingham. Salary £500 per annum.

NATIONAL SANATORIUM, Benenden, Kent.—Resident Assistant Medical Officer (male). Salary £200 per annum, rising to £350.

NEWCASTLE-UPON-TYNE CITY HOSPITAL FOR INFECTIOUS DISEASES.—Resident Medical Assistant (male) Salary £350 per annum.

NEWCASTLE-UPON-TYNE HOSPITAL FOR SICK CHILDREN.—Honorary Physician to the Electrical Department.

NORFOLK COUNTY MENTAL HOSPITAL, Thorpe, Norwich.—Junior Assistant Medical Officer. Salary £350 per annum.

PODDINGTON GREEN CHILDREN'S HOSPITAL, W.2.—(1) House-Physician. (2) House-Surgeon. Salary £150 per annum each.

PRINCE OF WALES'S GENERAL HOSPITAL, Tottenham, N.15.—(1) Honorary Medical Registrar. (2) Honorary Surgical Registrar. (3) Honorary Assistant Surgeon to the Ear, Nose, and Throat Department. (4) House-Surgeon. (5) Special House-Surgeon. (6) House-Physician. (7) Junior House-Surgeon. (8) Junior House-Physician. Honorarium for (1) and (2) £200 per annum; salary for (3), (4), and (5) £150 per annum, and for (7) and (8) £110 per annum.

PURNEY HOSPITAL, S.W.15.—Resident Medical Officer (male). Salary £150 per annum.

QUEEN CHARLOTTE'S MATERNITY HOSPITAL, Marylebone Road, N.W.1.—Obstetric Surgeon to Out-patients.

QUEEN MARY'S HOSPITAL FOR THE EAST END, Stratford, E.15.—Honorary Assistant Physician.

ROCHDALE INFIRMARY AND DISPENSARY.—Junior House-Surgeon. Salary £200 per annum.

ROTHERHAM COUNTY BOROUGH.—Assistant Medical Officer of Health (male). Salary £650 per annum.

ROYAL CHEST HOSPITAL, City Road, E.C.1.—Physician with charge of Out-patients.

ROYAL DENTAL HOSPITAL, Leicester Square, W.C.2.—Honorary Assistant Dental Surgeon.

ROYAL EIMWOOD INSTITUTION, Redhill.—Junior Assistant Medical Officer (male, unmarried) Salary at the rate of £250 per annum.

SHEFFIELD UNIVERSITY.—Assistant Pathologist at the Royal Hospital and Demonstrator of Pathology in the University. Salary £500 per annum.

SHREWSBURY: ROYAL SALOP INFIRMARY.—(1) House-Surgeon. (2) House-Physician. Salary £250 and £160 per annum respectively.

SOUTH LONDON HOSPITAL FOR WOMEN, Clapham Common, S.W.—(1) Female Clinical Assistant (Ophthalmic Department). (2) Clinical Assistant (Surgical Department), to attend at Out-patient Department, Newington Causeway.

STOKE AND WOLSTINGTON UNION.—First and Second Resident Assistant Medical Officers at the London Road Institution, near Newcastle, Staffs. Salary £250 and £200 per annum respectively.

WEST AFRICAN MEDICAL SERVICE.—Medical Officers. Initial salary £650 a year.

*This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column advertisements must be received not later than the first post on Tuesday morning.*

### APPOINTMENTS.

FORRESTER-BROWN, Maud F., M.S., M.D.Lond., Surgeon to the Children's Orthopaedic Hospital, Bath.

HALL, Percy, M.R.C.S., L.R.C.P., Honorary Actino-therapist to the Mount Vernon Hospital, London.

CERTIFYING FACTORY SURGEONS.—R. G. Barnes, L.R.C.P. and S. Edin.; L.R.F.P.S.Glas., for the Teutenden District, co. Kent; T. Elliott, M.R., C.B.Leds., for the Misterton District, co. Nottingham; F. S. Tidcombe, M.R.C.S., L.R.C.P., for the Bognor District, co. Sussex.

### DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE.  
Special Discussion: Tues., 5.30 p.m., Endocrine Therapy. Openers: Dr. W. Langdon Brown, Professor Swale Vincent, Mr. Leslie Pugh, Dr. H. Gardner-Hill, Mr. Kenneth Walker. Other Speakers: Dr. Leonard Williams, Dr. H. Crichton Miller. (The meeting, if necessary, can be adjourned at 7 p.m., and resumed at 8.30 p.m.)

Section of Surgery: Wed., 8.30 p.m., Sir Charles Ballance, Mr. Lionel Colledge, and Mr. Lionel Bailey: Some Results of the Experimental Anastomosis at Certain Nerves with Neighbouring Nerves (illustrated by diagrams, microscope slides, lantern slides, and cinema films).

Section of Laryngology: Fri., 4.30 p.m., Discussion: Paroxysmal Rhinorrhoea; to be opened by Dr. J. Freeman and Dr. A. Brown Kelly, followed by Dr. James Adam, Dr. Margaret G. Tod: Results of Operations on the Nose and Throat in Cases of Asthma.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.1.—Tues. and Thurs., 5 p.m., Lumsden Lectures by Dr. Hector Cameron: Some Forms of Vomiting in Infancy.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Fri., 5 p.m., Museum Demonstration by Sir Arthur Keith: Acromegaly and Allied Disorders of Growth.

HYGIENIC SOCIETY.—Fri., 7.30 p.m., Dinner Meeting at Simpson's Restaurant, Chancery Lane, E.C. Professor W. H. Dixon and Dr. H. H. Dale: The Use and Abuse of Drugs.

MANCHESTER MEDICAL SOCIETY, The University, Manchester.—Wed., 4.30 p.m., Discussion: Encephalitis Lethargica; to be opened by Dr. D. E. Core, W. St. Clair McClure, R. J. Byrie, and J. H. Dible.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Mon., 9 p.m., Third Lettisonian Lecture by Sir Bernard Spilsbury: Wounds and other Injuries in their Medico-legal Aspect.

WEST KENT MEDICO-CHIRURGICAL SOCIETY, Miller General Hospital, Greenwich, S.E.—Fri., 8.45 p.m., Dr. E. S. Royleham: Anaesthetics for Operations in the Region of the Mouth and Nose.

### POST-GRADUATE COURSES AND LECTURES.

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION, 1, Wimpole Street, W.1.—Mon., 5.20 p.m., Lecture: Myopia—its Diagnosis and Treatment. Wed., 5.20 p.m., X-rays in Diagnosis of Lesions in Right Upper Quadrant of Abdomen. Central London Ophthalmic Hospital, Judd Street, W.C.1: Lecture Demonstrations in Diseases of the Eye. Daily from 2.30 p.m. Royal Northern Hospital, Holloway Road, N.7: Intensive Course.

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL, Gray's Inn Road, W.C.1.—Fri., 4 p.m., Suppuration of the Middle Ear.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—Thurs., 4 p.m., Fractures.

### British Medical Association.

OFFICES AND LIBRARY, 122, STRAND, LONDON, W.C.2.

#### Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded if desired, on application to the Librarian, accompanied by £d. for each volume for postage and packing.

#### Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate Westland, London).

MEDICAL SECRETARY (Telegrams: Medivocera Westland, London).

EDITOR, British Medical Journal (Telegrams: Attology Westland, London).

Telephone number for all departments: Gerrard 2520 (3 lines).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh (Telegrams: 4361 Central).

IRISH MEDICAL SECRETARY: Frederick Street, Dublin (Telegrams: 4737 Dublin).

#### Diary of the Association.

MARCH.

27 Fri. Norwich Division: Medical Library, 8.20 p.m.

Sunderland Division: Scientific Meeting, Highfield Hospital, Sunderland, 7.30 p.m.

31 Tues. London: Grants Subcommittee, 2.30 p.m.

Craven General Hospital. Address by Dr. H. W. Harber on The Etiology and Treatment of Some Common Diseases of the Skin, 8.30 p.m.

West Suffolk Division: West Suffolk General Hospital, 3 p.m.

APRIL.

1 Wed. Nuneaton and Tamworth Division: Nuneaton General Hospital. Paper by Mr. C. A. Raison on the Acute Abdomen in the Child.

West Bromwich Division: District Hospital, West Bromwich, 8.30 p.m.

2 Thurs. Guildford Division: Clinical Meeting, Royal Surrey County Hospital, Guildford, 4 p.m.

3 Fri. Chesterfield Division: Maternity Hospital, Chesterfield. B.M.A. Lecture on Some Recent Advances in Endocrinology by Dr. A. E. Gow, 8.30 p.m.

8 Wed. Bath and Bristol Branch: Cottage Hospital, Wells. B.M.A. Lecture by Dr. W. A. Brand on the Legal Obligations of the Medical Man, 3.30 p.m.

14 Tues. City Division: Metropolitan Hospital, Kingsland Road, E.8. Paper by Dr. H. Maclean on Diabetes—its Treatment: Insulin up to date, 9.30 p.m.

15 Wed. Norfolk Branch: Norfolk and Norwich Hospital. Address by Dr. W. Norwood East on the Interpretation of Some Sexual Offences, 3.30 p.m.

South Middlesex Division: St. John's Hospital, Twickenham. General Business, 8.15 p.m.; Paper by Dr. H. C. Corry Mann on Dietary during the School Age, 8.30 p.m.

23 Thurs. Kensington Division: Kensington Palace Mansions Hotel, De Vere Gardens, W.8. Address by Dr. Seymour Taylor on Some Medical Aphorisms, 8.45 p.m.

Wakefield, Pontefract, and Castleford Division: Bull Restaurant, Westgate, Wakefield. Paper by Mr. J. F. Dobson on Urological Diagnosis, 8.30 p.m. Supper, 8 p.m.

MAY.

7 Thurs. Kensington Division: Divisional Dance, Kensington Town Hall.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Daily: In-patient and Out-patient Clinics, Operations, Clinics in Special Departments. Lectures and Demonstrations: Tues., 4.30 p.m., Lantern Lecture: Nature's Reminders of the Humble Origin of Man. Fri., 4.30 p.m., Nasal Obstruction, its Causes and Remedies.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION.—At Royal Maternity and Women's Hospital: Wed., 4.15 p.m., Obstetrical Cases.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.15 p.m., Cutaneous Eruptions of the Skin. Fri., 4.15 p.m., Medical and Surgical Cases.

### BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcement of Births, Marriages, and Deaths is 9s., which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

#### DEATHS

BRACKENBURY.—On March 21st, at Quernmore Road, Stroud Green, N.1, Joan, elder daughter of Dr. and Mrs. H. B. Brackenbury, aged 23 years.

STEWART.—On March 18th, at St. Mildred's Cottage, Milverton, Somerset, William Stewart, M.D., late of Bank House, Bacup, Lancs.

### PROCEEDINGS OF COUNCIL.

Wednesday, March 25th.

A MEETING of the Council of the Association was held at 429, Strand, on Wednesday, March 25th. Dr. R. A. BOLAM presided, and the following members were present:

Mr. J. Basil Hall (President), Dr. H. B. Brackenbury (Chairman of Representative Body), Mr. N. Bishop Harman (Treasurer), Mr. C. P. Childe (Past-President), Dr. R. Wallace Henry (Immediate Past Chairman of Representative Body), Dr. F. G. Thomson (President-Elect), Dr. C. O. Hawthorne (Deputy Chairman of Representative Body), Dr. G. A. Allan, Surgeon Rear-Admiral Sir Percy Bassett-Smith, K.C.B., C.M.G., R.N.(ret.), Dr. T. Ridler, Bailey, J. R. H. S. Beadles, Dr. J. W. Bone, Dr. H. C. Bristowe, Dr. G. F. Buchan, Dr. H. Guy Dain, Dr. J. Don, Dr. C. E. Douglas, Mr. T. P. Dunhill, Mr. W. McAdam Eccles, Dr. C. E. S. Flemming, Dr. E. R. Fothergill, Dr. T. W. H. Garstang, Dr. J. Giusani, Dr. F. J. Gomez, Dr. F. W. Goodbody, Colonel C. B. Heald, Dr. G. B. Hillman, Dr. I. W. Johnson, Dr. R. Langdon-Down, Dr. David Lawson, Dr. R. W. Leslie, Sir Richard Luce, M.P., K.C.M.G., Dr. A. Lyndon, Dr. J. A. Macdonald, Dr. S. Morton Mackenzie, Dr. A. Manknell, Dr. G. W. Miller, Dr. Hugh Miller, Dr. Christine Murrell, Mr. A. W. Nuthall, Lieut.-Colonel F. O'Kinealy, I.M.S.(ret.), Dr. William Paterson, Dr. R. C. Peacocke, Dr. F. Radcliffe, Lieut.-Colonel J. W. E. Rait, I.M.S.(ret.), Dr. G. Sanders, Dr. John Stevens, Dr. W. E. Thomas, Dr. G. Clark Trotter, Mr. E. B. Turner, Sir Jenner Verrall, Dr. J. F. Walker.

The Chairman reported the deaths of four who had been closely associated with the work of the Council—namely, Sir Clifford Allbutt, the revered ex-President, Colonel R. I. D. Hackett, A.M.S.(ret.), Dr. Evan Jones, and Dr. J. McGregor-Robertson, all past members of Council.

A vote of condolence with the families was carried standing, and a further vote was passed to Dr. Brackenbury on a domestic bereavement. The Chairman mentioned that Dr. Brackenbury's work in the preparation of the Association's evidence to be given to the Royal Commission on National Health Insurance had been carried out while he was suffering great anxiety and grief, and the profession was all the more deeply indebted to him for his labours. ("Hear, hear.")

Congratulations were accorded to members who had received honours.

A message of thanks to the Association for its assistance in obtaining subscriptions was received from the Royal Medical Benevolent Fund.

#### *Award of the Gold Medal to Dr. Bolam.*

The following motion, of which the President had given notice at a previous meeting, came next on the agenda:

That the Gold Medal of the Association be awarded to Dr. Robert Alfred Bolam, F.R.C.P., LL.D., for his distinguished services to the Association and the medical profession, and in special commemoration of his work in connexion with the acquisition of the new House of the Association, 1921-25.

Dr. Bolam left the meeting while the discussion on this motion took place, the Treasurer presiding in his stead.

The President said that Dr. Bolam's work in connexion with the new House was a fitting coping-stone to his other great services. He felt some hesitation in saying anything to his fellow members about the sterling qualities of Dr. Bolam, for most of those present had been longer in association with him than he had himself. He would say only one thing: if Dr. Bolam had a motto in life it must be "Service, not self." (Applause.) Short as his own experience of the Council had been, the patience and skill of the Chairman had made a great impression on his mind. Dr. Bolam was a man who "set the cause above the crown, and loved the game before the prize."

The motion would, of course, have been supported by every member of the Council, but he (Mr. Basil Hall) had chosen to attach to it, with their hearty consent, the names of the Past-President, the President-Elect, the Chairman of the Representative Body, the Chairmen of all the Standing Committees, Dr. Manknell, as representing the Division to which he himself belonged, and Dr. Fothergill, who, he believed, in term of service, was the oldest member of the Council.

Mr. C. P. Childe (Past-President), in seconding the motion, said that it would be waste of time to endeavour to enumerate the many services which Dr. Bolam had rendered to the Association, but if the qualification for the Gold Medal consisted, as he believed it did, of eminent services to the Association, and through it to the medical profession generally, then Dr. Bolam had not only qualified for this distinction, but had qualified with honours. His work in connexion with the acquisition of the new House was only one of his activities on behalf of the Association, and his business capacity, his unremitting attention to affairs, his sound judgement, his firmness (combined with courtliness) in the chair, and his sympathy and kindness of heart, had won for him a unique position on the Council.

Dr. Maedonald, in supporting the motion, said that when Dr. Bolam was suggested as his successor in the chairmanship of the Council he knew at once that he was the most suitable man who could have been chosen. There must be something invigorating about high office in the Association, for although when Dr. Bolam came to the chair he was really very ill, he was now, in spite of his arduous labours, very much better in health.

Dr. Wallace Henry said that during his chairmanship of the Representative Body he was in close association with Dr. Bolam, and realized how keenly he sought to promote the interests of the Association. In doing so he sacrificed time, money, and health.

Dr. Douglas, on behalf of the Scottish members, testified to Dr. Bolam's great help in the purely Scottish affairs of the Association. He attributed some of his excellences to the fact that he was a North Countryman, living close to the Scottish border. He had a shrewd intellect, a sense of humour, a spirit of determination—in fact, he might almost be a Scotsman!

By the regulations governing the award of the medal, the vote on the motion was taken by ballot, and a three-fourths majority was necessary. Forty-one members of Council were present, and the scrutiny showed that forty-one "Ayes" had been recorded.

Dr. Bolam, on returning to the Council, was heartily greeted, and expressed his acknowledgements of the honour done him. He was overwhelmed by the terms of the motion, and by the unanimity of the support which it had commanded. What work he had been able to do for the Association and for the profession—and anything he had done outside the circle of the Association had been in most cases at its instance—was more than rewarded by the appreciation of the members of the Council, who were well aware of the faults, the crudities, and the mistakes (of which he himself was very conscious), and yet continued to give him their confidence. He was deeply grateful to them all for their continued kindness during the five years of his chairmanship. It was possible to do service in face of difficulties, but nothing helped one so much to carry on as the knowledge that one had the support and appreciation of one's colleagues, which had found such kind expression that day. (Applause.)

Dr. Bolam then again took the chair.

#### Nomination of President.

On a communication from the Honorary Secretary of the Nottingham Division, intimating that the Division desired to nominate Mr. R. G. Hogarth, C.B.E., F.R.C.S., as President for 1926-27, the Council unanimously agreed to recommend the election of Mr. Hogarth to the Representative Meeting.

Sir Richard Luce desired to associate himself with this recommendation. He had known Mr. Hogarth very intimately ever since he had been in practice, and he was well aware of the high appreciation in which he was held in Nottinghamshire and throughout the East Midlands. He had the confidence of the whole of the profession, and the Association could not possibly have a better President during the year which began with the Nottingham meeting.

#### "Birth Control."

Dr. Fothergill brought forward the motion, which was postponed from the last meeting of Council, asking that a special committee be formed to consider and report to Council whether the Association could usefully issue a medical pronouncement to the profession and public on the question of birth control; and, if so, how and in what manner steps should be taken to prepare and issue such a pronouncement. Dr. Fothergill recapitulated the arguments which he had advanced on the last occasion (SUPPLEMENT, March 7th, p. 90), and drew attention to a report which was just being issued by the Bishop of Winchester's Committee on the economic, social, and ethical aspects of this problem; the medical aspect had been purposely left alone. The medical profession in America had appointed a Maternal Health Committee, which was elaborating the medical aspect. The speaker maintained that just as the private person was entitled to expect guidance from his doctor on medical questions or sociological questions with a medical side, so public bodies and other groups of the laity had a right to look to representatives of the profession for similar information and guidance. There was no body other than the British Medical Association to speak on this question in the name of the profession. Much harm was being done at the present moment by unauthorized and uneducated propaganda. The profession could not leave alone a subject which involved its prestige. He indicated the several respects in which research on this problem was desirable by a medical group. The only object of the resolution was a preliminary inquiry.

Mr. Turner, in seconding, said that this was one of the "live" questions of the day, about which doctors were continually being interrogated. It was unfortunate that at the present time there was no definite medical pronouncement at

all. Great pressure was being brought to bear upon the Government and the Ministry of Health that the teaching of birth control should be allowed at maternity and child welfare centres, and surely the Association should make some pronouncement on such a question. It was very unfortunate that reports by lay bodies should get the start of pronouncements by the Association. It was a right and proper thing that the Association should face this matter.

Dr. Hawthorne moved us an amendment:

That the Council does not judge the announcement of any formal finding on the policy and practice of birth control to be either necessary or advisable, as the subject is already fully discussed in numerous books and other available publications, as it is the cause of acute controversial differences between different sections of the profession, and as the functions of the British Medical Association do not include the responsibility of suggesting to members of the profession the nature of the advice they should give to their patients.

He pointed out that the terms of the amendment did not involve any expression of opinion upon the desirability or otherwise of birth control. The expression of opinion in the amendment was confined entirely to the question whether it was or was not advisable for the Council to attach its authority to an opinion in one direction or the other. It was unnecessary and inadvisable for the Association to enter upon this controversy. The facts, so far as they could be determined, were already at the disposal of every member of the profession, and as the question was as to the advice which a practitioner should give to his patients it was his duty to equip himself with the information already available if he decided to give advice at all. It was not the function of the Association to set up a standard according to which medical practitioners could advise their patients. Dr. Fothergill had spoken of collecting facts; but the facts were already published and available. The reasons why the course proposed was inadvisable were: (1) that it would seem to interfere with the general doctrine of the freedom of the individual practitioner and with the corresponding individual responsibility; and (2) the question was one of acute controversy, not confined to the calm of the intellectual plane, but engaging emotion and prejudice. It must not be forgotten that large sections of the profession deemed the practice of birth control to be highly immoral—for example, the members of the Roman Catholic Church and of sections of the Anglican Church.

Dr. Maedonald seconded the amendment, supporting heartily what Dr. Hawthorne had said. The Association would be led into difficulties if it took any steps to deal with this subject. The question of birth control *qua* birth control was purely social and political, not medical at all, though, of course, when it came to the actual practice, the view of the medical profession came in. He objected also to the setting up of a new committee to consider this subject, if it was to be considered at all; the members of this proposed committee were all nominated by Dr. Fothergill. If it was necessary to make any reference at all it might well have been to the Medico-Political Committee.

Sir Richard Luce said that this was a subject which was very prominent at the present time, and one in which the education of the medical profession itself was important. There was a strong feeling that the profession ought to be in a position to afford help and information, not on the sociological, but on the scientific side. He was in favour of having some sort of inquiry by the Association, but it should be confined to scientific aspects. The question, which might come forward in the way of proposed legislation, had already been considered by the medical members of the House of Commons, who would gladly be associated with an inquiry of this sort, if the Association saw fit to initiate it.

Dr. Flemming opposed the amendment because it was side-tracking the issue. The issue was not that the Association should lay down a policy with regard to birth control. He hoped that if the motion was passed the reference would be strictly limited to the medical aspects. The social, moral, and economic aspects were for statesmen to consider, but before the statesmen could so consider they must be informed as to the likely effect of birth control on the persons immediately concerned, and the profession ought to be able to give a definite answer without trespassing on the dangerous by-paths indicated in the present debate.

Dr. Langdon-Down said that there were certain matters upon which it was very difficult to get at the facts, because they were widely spread and necessitated a collective investigation. It might be useful for the Association to collect the facts, as, for instance, the actual effects of this practice on the population. The books written on the subject were written for the most part with a bias. Collective inquiries of this kind had been carried out by the Association.

Mr. Bishop Harman said that the burning question was not medical at all, but ethical, and therefore it was not incumbent upon the Association to interfere. He recalled the precedent

of the Council's action with regard to the proposed inquiry on faith-healing, which was turned down, some thought at the time unwisely, but the justification for the Council's action was to be found in the recent pronouncement of the Bishop of Durham.

Dr. Hawthorne pointed out that what Dr. Fothergill's motion aspired to was, not a collection of facts, but the pronouncement of medical opinion, and that being so, it would be impossible to confine the issue within the narrow limits suggested by some supporters of the motion.

Dr. Hawthorne's amendment was carried by a very large majority.

#### Post-Graduate Education.

The Chairman gave an account of certain informal but very important conversations on the subject of post-graduate education in this country which had been proceeding during the past few months. They arose at the suggestion of Sir John Lynn-Thomas, a former member of the Council, who, as a result of a visit to New Zealand, where he acted as the delegate of the Association, was impressed by the lack of machinery for assisting practitioners from overseas who came to this country for educational purposes. The informal meetings, of which four had been held, had been presided over by Sir Thomas Horder, and after various conversations he (Dr. Bolam) undertook to approach the Council of the Association, and to suggest that facilities might be offered to the post-graduate movement in the Association's new House by way of a theatre for lectures and the nucleus of a bureau. The Fellowship of Medicine and Post-Graduate Association of London had done a considerable amount of work on the subject, but much more remained to be done, and the Fellowship had been assured that any new efforts set on foot as the result of these meetings were intended in the spirit of co-operation. It was felt that possibly the Hastings Conference Hall in the new building might form a meeting place for demonstrations and systematic lectures. A certain expenditure would be entailed by the Association, but it would really be an extension of work the Association already undertook in the shape of advice and information to graduates.

Dr. Hawthorne said that the Council would sympathize with efforts from any quarter to increase the facilities for post-graduate teaching. London was the greatest clinical centre in the world, and yet there was no post-graduate scheme at all commensurate with the need and the opportunity. The Science Committee in September last appointed a nucleus Post-Graduate Subcommittee to watch the question and report. He desired to know exactly where the Science Committee stood in relation to these other conversations which had been proceeding independently. He also desired to know whether the facilities which it was suggested might be offered in the Association's House would be independently of or in association with those of the Fellowship of Medicine.

The Chairman said that it might be that the Council would think the question of post-graduate education one of such urgency that whether the co-operation of the Fellowship of Medicine could be secured or not the Association should provide facilities, and then it would be for those who had the matter in hand to try and enlist the co-operation of all those outside the British Medical Association. It was not contemplated that the use of the Association's House and the other facilities would be provided without recognition.

Dr. Morton Mackenzie moved a resolution welcoming the idea that the Association should take a greater interest in post-graduate education, and authorizing the Chairman to confirm the offer of secretarial help, office facilities, and the use of lecture hall. The position of post-graduate work in London was deplorable, and he thought a very great debt of gratitude was owing to Sir Thomas Horder and Sir Dawson Williams—the moving spirits of this new endeavour—for the time and trouble they had devoted to putting things on a better footing. There was something about the organization of post-graduate work which seemed to become sterile at once. He regretted that the Association had not taken advantage of an earlier opportunity to appoint a whole-time officer to deal with this subject. It would have led to a much better co-operation between the Association and the staffs of the large hospitals. The work was not being done as it ought to be done in London. If the Association took it on he believed that, in conjunction with the Fellowship, very good work could be done.

The Chairman suggested and Dr. Mackenzie accepted the following reading of the resolution:

That the Council welcomes the idea of the Association taking a greater interest in the organization of post-graduate work in London, and authorizes the Post-Graduate Subcommittee to continue negotiations to this end, and in the event of a satisfactory scheme being proposed would be prepared to provide facilities in its own House.

Mr. Bishop Harman believed that post-graduate education could be made a "profitable industry." He spoke from an

experience of twenty years of the West London Hospital Post-Graduate College, which paid its way and paid its lecturers. There might be some little deficit at the beginning in the Association scheme, but as graduates were attracted to London their registration fees and payments for facilities would become a valuable source of revenue.

Mr. McAdam Eccles said that after the primary education of the medical student for qualification nothing was so important for the profession at large and for the public as post-graduate teaching, and London certainly had been and still was woefully behind the times. It was apt to be forgotten that there were two sides to this particular type of education—one for those who came from abroad and required very special courses, and the other for the general practitioner at home, a matter to which the Ministry of Health was now turning its attention. If the British Medical Association could take up post-graduate teaching he was a little doubtful as to whether it should embark on the higher teaching, at any rate at present, because the basis of post-graduate teaching was clinical material and teachers; and although a bureau and a lecture hall and social amenities might be provided, unless the hospitals and other centres could be "roped in" and the teachers secured, any scheme of post-graduate education must fail. It was the outstanding wealth of clinical material and the ability of the teachers in some of the foreign centres which had drawn, and in some cases, in America particularly, was still drawing, the students.

Mr. Childs strongly supported the proposal, which he thought would have great propagandist value for the Association. Mr. Nuthall also thought it would be greatly to the advantage of the Association to enlarge this side of its scientific work. Mr. Dunhill said that a bureau in the Association offices would not give the prospective students what they required. They wanted to see clinical material and museums and bacteriological work. Before the Association embarked definitely upon this provision there should be a preliminary survey of the field.

Sir Jenner Verrall thought that the speeches showed the necessity for inquiring more fully into this matter. Certainly no time was to be lost. When visiting Canada the Medical Secretary and he appreciated the fact that members of the profession were anxious for such facilities, and that facilities were being provided elsewhere, to the detriment of the Association if it wanted to provide anything of the kind itself.

Dr. Hawthorne suggested that all the gentlemen who had been engaged in these conversations should be asked to meet the Post-Graduate Subcommittee. In his judgement the spending of money for this purpose could hardly be justified unless it was shown that there would be a reasonable financial return. Allowing something for the propaganda value of work of this kind, to take Association money for this purpose and confine to London what was provided would require very careful consideration before it was permitted. A great deal of work was done, especially through the efforts of Sir Dawson Williams, immediately after the war, when graduates were on their way back after service, but the matter since then had dragged.

The Chairman said that in the conversations it was explicitly laid down that not only London would be considered in affording facilities; it was hoped, for instance, that Oxford and Cambridge would help. The bureau would afford information about all post-graduate facilities throughout the country. A certain amount of information had been obtained as to clinical facilities, and their utilization as a result of these conversations, which would be at the disposal of any joint committee or enlarged committee which might be given the reference.

The principle in Dr. Morton Mackenzie's resolution was then agreed to by the Council, but a slight change was made in the authorization to the committee; the matter was referred to the existing Post-Graduate Subcommittee together with those who, under Sir Thomas Horder's chairmanship, had been engaged in the preliminary conversations referred to. The effect of this was to set up an *ad hoc* committee of Council consisting of the members of the two bodies concerned.

#### Veneral Diseases and Insurance Practice.

Dr. Dain, Chairman of the Insurance Acts Committee, referred to the evidence which the National Council for Combating Veneral Diseases was proposing to give before the Royal Commission on National Health Insurance. It appeared probable that, judging from a circular letter which the National Council had sent to each of its branches, the claim would be made that the treatment of gonorrhoea, although at present, by the ruling of the Ministry of Health, within the competence of the general practitioner, necessitated such lengthy special treatment and such a large number of specialized instruments and apparatus as to render success in general practitioner treatment in the majority of cases an impossibility. Dr. Dain moved a recommendation on behalf of his Committee, "That the treatment of any disease as such should not be removed from the province of the general practitioner's duties, and that the

treatment of syphilis and gonorrhoea does not call for a special modification of this principle." He said that the general practitioner was responsible in the first instance for any and every disease for which a patient came to him. If the disease required the treatment of a specialist, then it was his duty to pass the patient on to a specialist.

Mr. Turner said that it had been his work on the National Council to keep the activities of that body in accordance with the principles of the Association. The question of the treatment of syphilis and gonorrhoea became rather acute about 1920, when large districts were not covered by clinics, and a discussion took place in the Representative Meeting, which practically unanimously agreed with the proposals of the then Local Government Board whereby salvarsan was to be given only to such practitioners as showed themselves to be qualified to administer it. In districts where there was no clinic available the patient was dependent on the general practitioner for his treatment, and the idea of the National Council had been to get men to qualify themselves so as to undertake treatment in those districts. He moved an amendment which would make the latter part of the motion read, "but that the treatment of syphilis and gonorrhoea calls for a special modification of this principle."

Dr. Brackenbury said that Mr. Turner's proposition arose from two assumptions with which he could not agree—one that the general practitioner was always foolhardy, and the other that the specialist never made a mistake. He would, however, suggest some alteration in the wording of the motion, making it plain that the treatment of any disease as such should not be removed from the province of general practitioners as a class, and that syphilis and gonorrhoea did not call for a specific modification of this principle. He understood Mr. Turner to plead that syphilis and gonorrhoea at all stages and in all persons required this special skilled treatment, which general practitioners were not in a position to give. That would involve the removal from the purview of the general practitioner of, for example, locomotor ataxy. He hoped the Council would maintain the principle that there was no disease which, because it was such and such a disease, should therefore, in all its stages and manifestations, be removed from the sphere of the general practitioner.

Dr. Hawthorne agreed with the sound doctrine preached by Dr. Brackenbury, but his explanations would not be available to those to whom this resolution would go. The true position of the profession was not defined by stating that particular diseases should not be removed from the purview of any practitioner. The true position was that in consequence of the training of the practitioner, which enabled him to know what he was competent and not competent to do, every practitioner must be deemed competent to advise any patient, whatever the nature of the patient's complaint. That was the time-honoured tradition of the profession, and was in harmony with the actual facts. The statement of principle which he favoured said nothing about treatment, but everything about advising the patient. Every medical practitioner was continually telling some individual patient that he was not competent to treat the condition which the patient presented. Dr. Dain agreed with Dr. Hawthorne, but said that in this resolution his Committee had been dealing with a specific point submitted to it, and not with the whole question.

Mr. Turner's amendment was lost, and discussion continued on Dr. Brackenbury's alternative wording.

The Chairman of Council said that he was entirely in agreement with the principle enunciated by Dr. Brackenbury. Within his knowledge there were plenty of practitioners at the present day who were doing this work very efficiently, both with regard to syphilis and to gonorrhoea. It would be very unwise to depart from the general principle that the general practitioner must be the guide in the matter of treatment, and very often must be the person actually undertaking the treatment in all these cases.

Dr. Brackenbury's amendment—

That the Association maintains the principle that the treatment of any disease as such should not be removed from the province of general practitioners as a class, and that syphilis and gonorrhoea do not call for special modification of this principle.

was carried.

#### THE EVIDENCE BEFORE THE ROYAL COMMISSION.

The Chairman brought forward a report of the recent Conference of members of the Representative Body and of representatives of Local Medical and Panel Committees (SUPPLEMENT, March 21st, p. 105). He said that it was the largest meeting of representatives of the profession which had been held for many years, and was very cordial and unanimous. On the whole, the Memorandum found general agreement, but there were a few resolutions of the Conference necessitating some alteration to the Memorandum, and some others referred by the Conference to the Council for consideration.

Dr. Brackenbury said that with regard to the suggested provisions for maternity service, the Conference was distinctly in favour of the method of consultation of practitioners during the maternity period rather than that of substitution. He accepted certain amendments by Dr. Fothergill in the new paragraph 29 with the object of making this position quite clear. With these amendments incorporated the latter part of paragraph 29 would read:

"... Within these limits, therefore, every maternity case should be in relationship with a responsible medical practitioner, though if the mother arranged for the actual attendance of such practitioner in respect of a normal confinement this would be an arrangement outside the insurance provision. Provision for a woman within the insurance scheme would thus be for (a) ante-natal medical examination (if requested by her) and supervision, (b) attendance by a registered midwife during normal labour and the puerperal period, (c) attendance by the practitioner of her choice during labour and the puerperal period when his attendance is requested by the midwife under defined conditions or when as the result of his ante-natal examination he has declared his personal attendance to be necessary. Professional services under these headings would be remunerated as in the case of the other extra services, by a special scale of fees."

Dr. Fothergill pointed out that there were two classes of women to be considered in this connexion: one, an insured person in her own right, with regard to whom the Conference said that she should not be removed from the doctor on whose list she was, except during the maternity period; the other, the wife of an insured person, who would not have an insurance practitioner at all and whose private doctor might not undertake maternity work.

Dr. Brackenbury said that this was a considerable difficulty. It was met, of course, if the suggestion made elsewhere in the Memorandum with regard to the inclusion of dependants was adopted. Otherwise difficulty would arise in the contingency of an insured man's wife, not herself an insured person, about to become a mother, and whose private practitioner did not undertake maternity work, but such cases would be rare.

Dr. Fothergill suggested that after the words "Provision for a woman within the insurance scheme" (in the paragraph quoted above) there should be added the words "as set forth in this Memorandum." Dr. Brackenbury agreed to this, and the revised paragraph thus amended was accepted by the Council.

#### The Liberties of the Profession.

Dr. Brackenbury then brought forward an additional paragraph of great importance, which he had drafted with regard to the judicial or semi-judicial functions of the Ministry:

"There have recently been a number of cases in which the action of the Ministry of Health in imposing penalties on practitioners has appeared to the Association to be of an inexplicable character, and has given rise in the minds of many practitioners to a feeling of injustice, or even of a suspicion of vindictiveness. The Association recognizes the administrative duties of the Ministry in this connexion, and is very anxious to foster in the profession a feeling of confidence in the exercise by the Ministry of its judicial, or quasi-judicial, functions associated therewith. When, however, agreements with the profession have been reached with regard to the machinery and procedure by which decisions shall be arrived at, it is exceedingly disquieting to find that, though the machinery is used and the procedure followed, there are cases in which there seems little or no relationship between the decisions of the Ministry and the reports or recommendations of the bodies on which action is supposed to depend. The Association desires to emphasize its view: (1) that when a complaint has been dealt with by the bodies set up by the Regulations for this purpose there should not be a liability to have the whole matter reopened by separate departmental action, either by the Ministry itself or by those bodies at the instigation of the Ministry; (2) that when the complaint has been made in one prescribed form penalties should not be inflicted in respect of offences not formally alleged or of offences which, if alleged, should have been formulated in a different prescribed way and might have required a different line of defence; (3) that full consideration should be paid to the findings or recommendations of a committee (whether Medical Service Subcommittee or Inquiry Committee) which has itself investigated the details of the case in mitigation of the heinousness of the misconduct even when proved; (4) that it is essential to draw a strict distinction between professional conduct in the attention given to a patient and the nature of the exact professional treatment given to the patient, and that the propriety or otherwise of any particular method or line of treatment should not be made the subject of investigation in connexion with the insurance service."

Dr. Fothergill complained of the unduly moderate language of the proposed new paragraph. He would use a much stronger phrase than "It is exceedingly disquieting."

Dr. Brackenbury, declaring his belief in the virtues of understatement rather than overstatement, said that the witnesses would go armed to the Commission with full particulars of all the cases—five in number, he believed—of extreme importance, which were the subject of complaint in this paragraph, and the grievance would be plainly stated by the witnesses, who would say that the profession could not tolerate this sort

of procedure if it went on without explanation from the Ministry. What he would maintain was that the specific charges must be definitely formulated so that the accused practitioner might have a full opportunity of dealing with them.

Mr. McAdam Eccles pointed out what seemed to him an inordinate length of time between the finding of the Committee of Inquiry and the publication of the Ministry's decision. For six or seven weeks this matter might be hanging over the practitioner's head, and be a matter of comment in his neighbourhood.

Dr. Dain remarked that in addition to the representations which the witnesses would make to the Commission, the Insurance Acts Committee would have some very definite things to say to the Ministry of Health.

The new paragraph was agreed to.

Discussion next took place on the age of entry into insurance, which was the subject of a resolution of the Conference. After some discussion it was agreed to proceed to the next business.

Dr. Brackenbury next brought forward the resolution of the Barnstaple Division, referred by the Conference to the Council for consideration, on the subject of certification, and objecting to the present obligatory certification rules. Dr. Brackenbury said that the Barnstaple Division had devoted a great deal of time to the paragraphs dealing with certification, and had put up a series of amendments which would have resulted in changing what might possibly be underemphasis in the original document into overemphasis, with some inaccuracy of statement. But he thought there were certain things which could be done to meet the Barnstaple position, the principal being a new paragraph which he proposed to insert, protesting against certain non-professional duties and requirements of medical practitioners, which were specially burdensome in rural areas. Dr. Dain and Dr. Bone, however, criticized the proposed insertion, and Dr. Brackenbury said that he would withdraw it, but he took up a suggestion by Dr. Dain that in rural areas it might be sufficient to have in the form of certificate the phrase: "I have satisfied myself that on (date) (person) was incapable of work." On this several members asked why any differentiation should be made between rural and urban practitioners, and urged that if it was safe in the one case it was safe in the other. Dr. Brackenbury pointed out that differentiation already existed in the Memorandum as between country and town in regard to the interval between certificates. It must be recognized that there were things which it was much more difficult for the rural than for the urban practitioner to accomplish.

It was agreed to leave it to the witnesses to make the matter clear in oral evidence.

Dr. Brackenbury then said that with regard to the other suggestions left to the Council's consideration by the Conference, he would propose that they be not adopted, on the ground that most of them were already covered by the Memorandum in some form or other, or that others would be inexpedient and contrary to the spirit of the Memorandum.

Dr. Morton Mackenzie said that the Reigate Division wished to emphasize its opinion that a definite income limit for dependants should be stated, as, for example, £150. Dr. Brackenbury said that when this Memorandum was first discussed the Council decided that it was better not to put down definite figures, and income limits had not been named.

It was agreed to leave this also in the hands of the witnesses.

Four chief witnesses were then appointed to give evidence before the Commission—namely, Drs. Bolam, Brackenbury, and Dain, and the Medical Secretary—and they were given full power to call in other representatives of the profession to deal with special matters.

#### *The Joint Tuberculosis Council.*

Dr. Ridley Bailey, on behalf of the Public Health Committee, brought forward a recommendation to the effect that no useful purpose would be served by the continued representation of the Association on the Joint Tuberculosis Council. One of the Committee's reasons for this recommendation was that the multiplication of bodies doing work of a similar nature was undesirable; another was that the Memorandum which the Joint Council proposed to submit to the Royal Commission on National Health Insurance conflicted at certain points with the views advanced by the Association.

Dr. Lyndon, who was one of the representatives on the Joint Council, said that he saw no reason why the quite recent decision of the Council of the Association to appoint representatives should be reversed. He believed that, save in one respect, the evidence which the Joint Council proposed to give was in harmony with the Association's views, and in any case the Society of Medical Officers of Health, with which the Association continued to work in closest co-operation, was giving evidence, much of which was directly opposed to the Association's views. Dr. Hillman the other representative,

supported Dr. Lyndon's contentions, and said that he regarded the Joint Council as a very useful body. Dr. Brackenbury said that, studying the heads of evidence, he was afraid the Association would disagree, not on one of the points only, but on about half of them. At the same time it might be worth while to appoint representatives on a body with whose general conclusions on a particular matter the Association was not in agreement.

It was agreed that the recommendation should be withdrawn, and that the representatives should continue to attend, and should hold a watching brief in the interests of the Association.

#### *Nursing Homes (Registration) Bill.*

Mr. Turner, on behalf of the Medico-Political Committee, moved, in view of the introduction of the Nursing Homes (Registration) Bill into the House of Commons, a recommendation: "That the Council is of opinion that all nursing homes should be registered."

Dr. Fothergill moved, as an amendment:

That the Council is of opinion that adequate provision has been made for exercising control over registered medical practitioners who receive into their own homes resident patients, and therefore they should be included amongst the exceptions enumerated in Clause 13 of the bill.

Dr. Fothergill said that the definition of a nursing home as set out in the bill included "any premises used or represented as being intended to be used as a place for the reception of women in childbirth or persons suffering from any sickness, injury, or infirmity; for the purpose of the provision of such persons with nursing and medicines or food, either with or without medical or surgical aid, where any payment or reward is made, given, or promised." That definition bore upon three classes of persons whom doctors took into their homes—namely, single certified patients, border-line cases, and oldish persons with heart, rheumatic, or other chronic complaints, who wished to reside with a doctor. Hundreds of doctors would be affected. The doctor who took in such a patient would have to apply for registration and give details of his equipment, and his application could be refused for various reasons, as, for example, that the doctor himself was unsuitable, that anyone he employed was unsuitable or unqualified, that the premises were unsuitable, that the equipment for patients, staff, or domestics was unsuitable, or that too many patients were received. The Minister of Health could make general regulations, administrative and penal; a certificate had to be exhibited in a suitable approved place in the home; the medical officer of health or an appointed State registered nurse might at all reasonable times enter and inspect the premises, and there were other onerous provisions. The whole object of these patients in being with the doctor was in order that they might secure a private life, but under this arrangement they would be subject to various invasions. The medical man's house ought to come under the other exemptions—hospitals, infirmaries, etc.—set out in Clause 13.

Mr. Bishop Harman seconded the amendment, which was accepted by Mr. Turner as an addendum to the recommendation, and so agreed to by the Council, with the instruction that support should only be given to the bill if approved by the Parliamentary Subcommittee of the British Medical Association.

#### *The Finances of the Association.*

The Treasurer (Mr. Bishop Harman) said that the financial statement that he had to submit for the twelve months ending December 31st last was very satisfactory. The late Treasurer budgeted for a surplus of £5,000; the surplus realized was £8,000. The increase of membership had brought with it an increase of revenue, but, of course, of expenditure also. To a large extent the commitments on the new building were being financed out of revenue. Subscriptions in arrears were being realized in a very satisfactory fashion. For next year's budget he again anticipated a surplus, which he put modestly at £4,000.

The Chairman gave an account of the progress of the new building. The architect, Sir Edwin Lutyens, had returned from India, and expressed himself satisfied with the work which had gone on in his absence. The Gates of Honour were practically completed. A report had been made on the flags representing the towns the Association had visited; these would hang in the main hall. He exhibited the handsome flag representing London, with the City arms, presented by the Metropolitan Counties Branch. It was proposed to make suggestions to the places presenting flags as to the groundwork of the devices in order to get a harmonious colour scheme. Dr. Bolam proceeded to give some account of the finance relating to the building.

#### *Individual Medical Defence.*

Dr. Morton Mackenzie brought forward, on behalf of the Organization Committee, an exhaustive report on the question of individual medical defence, which was raised again at the Annual Representative Meeting in Bradford. He said that

this question had often been discussed by the Council, but on this occasion he was able to bring it forward in a more complete form than ever before. His Committee asked that the very important step should be taken of approaching the members by circular to find out how many of them would be prepared to join a defence organization created under the Association's auspices. A great deal of work had been done on this subject since the Representative Meeting, and an extremely able document had been prepared by the Financial Secretary showing clearly the difficulties that would confront the Association in starting medical defence work. In this document Mr. Ferris-Scott had expressed the view that, in all the circumstances, the work could not be safely undertaken on a membership of less than 6,500. A very useful history of the medical defence question had been prepared by the Intelligence Officer, Miss Lawrence; this showed that the point at which his Committee asked the Council to arrive that day had been reached twice before during the last twenty years. He thought he could lay down certain propositions which were incontrovertible. There was no doubt that if there were no societies doing this work the Association ought to take it up, but there were such societies. It was granted that it was impossible for the Association as such to do the work at all; it would have to be done by a linked body of some kind. It was also agreed that every effort had been made to get the existing societies to co-operate, and this had proved fruitless. Any idea of making medical defence compulsory on all members of the Association was out of the question. A partial form of medical defence was found to be quite impracticable if one went into details. The only possible alternative, therefore, was optional full medical defence, which meant medical defence such as was afforded by the societies existing for that purpose. This would satisfy those members who desired that the Association should provide something of this kind, and it would not offend members who already belonged to the existing societies. There were certain difficulties, most of them of a slight or temporary nature, such as the early financing of the venture. His Committee was unanimous in recommending, as a report to the Representative Body:

That, having carefully reviewed the whole question of medical defence, the Council is of opinion: (a) that the only possible form of medical defence which can be afforded to members is full medical defence (as given by the existing societies) to such members as desire it and are willing to pay a separate subscription for it; (b) that it is possible to give such full defence by initiating a separate organization; and (c) that such an organization should not be launched unless a reasonable measure of support is forthcoming.

Dr. Lyndon opposed the recommendation. If such a scheme were started it would have to be pushed, and to push it would be to declare war on the existing defence societies. He did not think that anyone would claim that the British Medical Association would do this work better or more cheaply or with fewer complaints than those special bodies which had done it for so many years. Having allowed these societies to grow up, it would be lamentable to try and suppress them. He could speak for the Medical Defence Union that its membership was increasing; it had elected 500 members since January 1st.

Mr. Bishop Harman supported the recommendation. The agitation in favour of the Association taking up this work had been going on for thirty years, and this was outstanding evidence of the desire of members of the Association for something of this kind. There was now an opportunity to put the matter to the test, and really to ascertain what support the venture would receive.

Dr. Beadles hoped the Council would pass the recommendation. He recalled that this controversy was in being when he joined the Association in 1896, and to him it appeared extraordinary at that time that he should have to go to some outside body to get his individual medical defence.

Mr. McAdam Eccles said that there was no doubt that the first thing that the newly qualified medical man or woman thought about was medical defence. When he was asked questions on this subject by young practitioners he was always sorry that he could not refer them to the British Medical Association. If the Association took up this full optional medical defence it would be an enormous advantage to the Association in its hold over new entrants into the profession.

Dr. Morton Mackenzie said that they were not declaring war on the existing societies. The existing societies had been given every opportunity of entering into co-operation, and had refused.

The recommendation was carried by a large majority, and a further recommendation to the Representative Body was also carried that a draft scheme be prepared, on the basis of an annual subscription of £1, in order to ascertain the number of members who desired the initiation of such a scheme and were prepared to join in its membership.

### Other Business.

Other committee reports, which gave rise to no discussion, were those of the Naval and Military, Science, Dominions, and Journal Committees.

The Council heard with great satisfaction that delegates from the American Medical Association would attend the opening of the new House and the Annual Meeting at Bath. It appointed the President to represent the British Medical Association at the meeting of the American Medical Association at Atlantic City in May next.

The Council congratulated the Irish Medical Secretary, Dr. Hennessy, on his election to the Dail. The Irish Committee was instructed to bring up a report at the next meeting on the Irish secretaryship, in particular on the amount of time which would be required of Dr. Hennessy in the discharge of his new duties and the effect that this might have upon the work of the office.

On the matter of the report of the Royal Commission on the Superior Civil Services in India (which was the subject of a long discussion at the last meeting of Council), Sir Richard Luce stated that the Government had made no pronouncement up to the moment. The Government had decided to bring in a bill embodying a good many recommendations of the Lee Commission, but had expressly left out the recommendations with regard to the medical services. Lord Birkenhead had stated that no steps were to be taken with regard to the medical services until further information was forthcoming from India, and Sir Richard Luce believed that the matter would be left until the return to this country of the Viceroy.

The Chairman brought forward the report of the conference on the public health scale of salaries, and said that it was very satisfactory that the Ministry of Health had agreed that the scale now suggested was a reasonable scale, and that certain provisos appended to it were also reasonable. The scale, as finally agreed for recommendation to the Representative Body, will be published as Appendix V to the Annual Report of Council in the next issue of the SUPPLEMENT, and some account of the negotiations will be found in the appropriate place in the body of the report.

The Council approved the Memorandum on Coroners' Law and Death Certification for recommendation to the Representative Body in substitution for the existing policy. This will be found as Appendix IV to the Annual Report.

The work before the Council at this session was unusually heavy. The meeting began at 10 a.m., and the business was not completed until 10.15 p.m.

## British Medical Association.

### CURRENT NOTES.

#### Annual Meeting, Bath: Ladies' Sports.

Active preparations are being made for ladies' sports in connexion with the Annual Meeting at Bath. The local golf and tennis clubs are making the visitors honorary members, and it will greatly assist in the arranging of matches and competitions if intending players would send their names in advance to Mrs. Dorseton, 16, Queen Square, Bath, who is chairman of the Ladies' Sports Subcommittee.

#### The Dorset County Council and its Medical Service.

We recently drew attention to the efforts of the West Riding County Council to obtain medical officers at a commencing salary less than that of the scale recognized by the British Medical Association, the Society of Medical Officers of Health, and the Medical Women's Federation. The offer of that council was, however, princely compared with one which is now being made by the Dorset County Council, which is advertising in the lay press for an assistant county medical officer of health at £500 per annum, with no suggestion of any regular increments in salary. The County Council goes on to intimate that the possession of a diploma in public health, sanitary science, or State medicine, and special experience in diseases of children, diseases of the eye, tuberculosis, and mental deficiency, will be considered additional qualifications for the appointment. The County Council is probably astonished at its own moderation in not demanding an acquaintance with other specialties. The medical man who gets this appointment will be entitled to regard himself as a complete "all-round specialist," though it may be doubted whether he will

be accepted by the practitioners of Dorset at the County Council's valuation of him. The commencing salary approved by the British Medical Association for a post of this kind is £600 a year, and it is postulated that the officer must have had at least three years' experience since qualification. When it is remembered that the Ministry of Health has agreed that this is reasonable and is prepared to support it, and that the Association of Municipal Corporations is also of opinion that the scale, including this section, is not unreasonable, it is to be hoped that no member of the profession, however unsophisticated, will be taken in by the ridiculous offer of the Dorset County Council.

#### The Profession and Local Authorities.

A notice has been issued to the members of the Willesden Division of the British Medical Association by the Divisional Chairman and the Honorary Secretary, stating that Drs. Lock and Skene, who have represented the profession upon the Willesden Urban District Council for the last three years, and have done good work for the public while carefully guarding professional interests, have both agreed to seek re-election. Polling is on Monday next, April 6th.

### SOUTH AFRICAN COMMITTEE.

#### THE YEAR'S WORK.

THE following is a summary of the proceedings of the South African Committee of the British Medical Association for the year 1924.

**Medical Ethics.**—A *Guide to Medical Ethics* was published early in the year, and has proved to be of great value to practitioners. There has been a growing demand for the book, which has been very favourably reviewed in the medical press. (See *BRITISH MEDICAL JOURNAL*, Supplement, April 12th, 1924, p. 161.)

**Medical, Dental, and Pharmacy Bill.**—This consolidating bill came before Parliament early in the year, and its medical penal clause was sent to a Select Committee. The President of the South African Committee gave evidence before this Select Committee in Cape Town in support of the clause. Very strong exception is now taken to Clause 34, as amended by the Select Committee, as it removed "Christian Scientists" (and other denominationalists) from the operation of the clause, and in effect permitted them to charge fees for their ministrations to the sick. It remains to be seen whether Parliament will accept such amendment.

**Benevolent Fund.**—A handsome donation to this fund was received from one of the members, and it now shows a credit balance of £517.

**New Branch.**—An application to form a new Branch with headquarters at Port Elizabeth was received, and met with the unanimous approval of the Committee. The adjacent Branches were asked to co-operate with Port Elizabeth in defining the area for the new Branch.

**Midwives: Registration and Control by Municipalities.**—As the registration and control of midwives is not provided for by municipalities generally, a motion was passed suggesting that power be taken in the contemplated Public Health Amendment Bill to enable the Minister to issue regulations permitting of this.

**Medical Organization.**—Owing to various circumstances it has not up to the present been found possible to appoint an organizing secretary for the Union of South Africa, and the British Medical Association Council has very willingly agreed to keep the offer of £1,000 a year for three years open for another year. Meanwhile the Committee recommended that for propaganda purposes the Branches should each appoint a Branch Organizing Secretary.

**Propaganda.**—A small subcommittee was appointed to frame a circular, setting forth the objects and advantages of the British Medical Association, for circulation to non-members of the British Medical Association in South Africa, with a view to increasing the membership.

**Annual Medical Lecture.**—It was resolved that a lecturer be appointed to deliver an annual lecture at various centres in the Union, and the first lecturer appointed was Professor G. Ritchie Thomson. The lecturer is to be known as "The South African B.M.A. Lecturer," and it has been decided that local lecturers be appointed by Branches for the purpose of lecturing in the outlying districts of Branch areas.

**Honorary Medical Secretary.**—It was thought that the South African Committee would be strengthened by the appointment of an Honorary Medical Secretary as an additional office-bearer, and Dr. Goldschmidt of Cape Town was unanimously elected to the office.

**Scale of Salaries in Public Appointments.**—A subcommittee was appointed to go into the matter of salaried public appointments and to report to the South African Committee. The report which this subcommittee drew up was an admirable one. It has now been sent to the Branches for their information and remarks.

**Hospitals Commission.**—Dr. Campbell Watt, as President of the South African Committee, appeared before the Hospitals Commission appointed by the Government, at very short notice. His evidence consisted mainly of resolutions passed by medical congresses and by this Committee on the following subjects: Medical Congress Resolutions—hospitals, medical attendance, mental diseases, control of general hospitals, tuberculosis among natives, medical research, and child welfare; South African Committee Resolutions—scale of salaries in public appointments, pensions for medical officers, sharing fees with hospitals.

**South-West Protectorate: Proposed Branch.**—A new Branch of the British Medical Association is about to be formed for the South-West Protectorate, and it is understood that the probable members thereof are willing to come under this Committee's jurisdiction. A letter was sent to the medical profession in the South-West Protectorate congratulating them on the steps they have taken to form a Branch and inviting them to elect their representatives to the South African Committee, if they desired such representation.

**Malaria and Agricultural Development.**—As the outcome of the Empire Parliamentary Delegation, one of whose members (Dr. Chapple) emphasized the paramount importance of combating malaria in the interests of cotton cultivation, a resolution was passed by the Committee urging upon the Government the desirability of taking such steps as will tend materially to diminish the prevalence of the disease.

### Association Notices.

#### SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

##### SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships, as follows:

1. AN ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1925. A Scholar may be reappointed for not more than two additional terms. A Scholar may hold a junior appointment at a University, Medical School, or Hospital provided the duties of such appointment do not interfere with his work as a Scholar.

The conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

##### GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

##### Applications.

Applications for Scholarships and Grants for the year 1925-26 must be made not later than Saturday, June 6th, 1925, on the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated to whom reference may be made.

ALFRED COX,  
Medical Secretary.

March 21st, 1925.

## ELECTION OF REPRESENTATIVE BODY.

## (A) Representatives of Constituencies.

THE Council has grouped the Divisions for election of the Representative Body, 1925-6, in the manner shown below. As will be seen, the 1924-5 grouping has been repeated, except that the Furness and Kendal Divisions of the North Lancashire and South Westmorland Branch have been made independent Constituencies.

Under By-laws 41 and 43. Representatives and Deputy-Representatives of Constituencies require to be elected by May 16th.

It is a matter for the Executive Committee of the Division (or, where the Constituency comprises more than one Division, for a joint meeting of the Executives of the Divisions) to decide whether the Representative(s) and Deputy-Representative(s) shall be elected by a General Meeting of the Constituency or by Postal Vote. The meeting must be called (or, where the election is by voting papers, these must be issued) by the Secretary of the Division (or, in the case of Constituencies consisting of more than one Division, by the Secretary of the Division having the largest number of members).

If election is adopted, a meeting of the Constituency is required to be held in the period June 18th to July 17th, to instruct the Representative(s).

The names of the Representatives and Deputy-Representatives require (By-laws 41 and 43) to be received by me not later than June 4th.

## (B) Representatives of Public Health Service Members.

Notification as regards the election, by public health service members, of 4 Representatives and 4 Deputy-Representatives in the Representative Body, appeared in the SUPPLEMENT of March 14th, 1925.

ALFRED COX,  
Medical Secretary.

## (II) OVERSEA CONSTITUENCIES.

The Council has made each Oversea Division and Division Branch an independent Constituency, entitled to elect one Representative and one or more Deputy-Representatives (By-laws 40 and 43).

## BRANCH AND DIVISION MEETINGS TO BE HELD.

**BATH AND BRISTOL BRANCH.**—A meeting of the Bath and Bristol Branch will be held at the Cottage Hospital, Wells, on Wednesday, April 8th, at 3.30 p.m., when Dr. W. A. Brend will give a British Medical Association Lecture on the legal obligations of the medical man. Tea will be provided.

**BIRMINGHAM BRANCH: COVENTRY DIVISION.**—A meeting of the Coventry Division will be held on Tuesday, April 7th, at 8.30 p.m., at the Coventry and Warwickshire Hospital. Agenda: Correspondence; election of representatives; report of representative; lecture by Dr. Harrison Butler on modern methods of examining the living eye.

**LANCASHIRE AND CHESHIRE BRANCH: MID-CHESHIRE DIVISION.**—A meeting of the Mid-Cheshire Division will be held on Sunday, April 5th, in the Board Room of the Altrincham General Hospital.

at 4 p.m. Tea will be provided at 3.45 p.m. Lecture by Dr. Meredith Young (County Medical Officer of Health) on the public health services.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, E.8, on Tuesday, April 14th, at 9.30 p.m., when Professor Hugh Maclean, D.Sc., M.D., M.R.C.P., Director of Medical Unit, St. Thomas's Hospital, will read a paper entitled "Diabetes—its treatment: insulin up to date." A Divisional dinner and fancy dress dance and carnival—fancy dress optional (four prizes)—will be held at the Holborn Restaurant on Thursday, April 30th, from 7.30 p.m. to 2 a.m.; bridge. Refreshments during evening. Tickets 15s.; early application will be greatly appreciated by Dr. Ernest A. Worley (honorary secretary), 43, De Beauvoir Road, N.1.

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—A general meeting of the Kensington Division will be held on Thursday, April 23rd, at the Kensington Palace Mansions Hotel, De Vere Gardens, W.8, at 8.45 p.m. An address will be given by Dr. Sermour Taylor, consulting physician to the West London Hospital, entitled "Some medical aphorisms."

**METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.**—A meeting of the South Middlesex Division will be held at St. John's Hospital, Twickenham, on Wednesday, April 15th, at 8.15 p.m., for general business. At 8.30 p.m. Dr. H. C. Corry Mann, O.B.E., will read a paper on dietary during the school age.

**METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.**—A meeting of the South-West Essex Division will be held at the Claybury Mental Hospital, Woodford Bridge, Woodford Green, on Tuesday, April 7th, at 3.30 p.m. Agenda: Correspondence; any other business. At 4.15 p.m. Dr. C. F. Harlam, superintendent of the hospital, will read a paper on the latest treatment of general paralysis of the insane by inoculation with malaria. Cases of interest will be demonstrated and pathological specimens shown. Tea at 3.15 p.m.

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—A meeting of the Chesterfield Division will be held at the Maternity Hospital, Chesterfield, to-day (Friday, April 3rd), at 8.30 p.m., when Dr. A. E. Gow, physician to St. Bartholomew's Hospital, will deliver a British Medical Association Lecture on some recent advances in endocrinology.

**NORFOLK BRANCH.**—A meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital at 3.30 p.m. on Wednesday, April 15th, when an address will be given by Dr. William Norwood East, Chief Medical Officer of H.M. Prisons Commission, on the interpretation of some sexual offences. Afternoon tea, 4.45 p.m.

**NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.**—Scientific meetings of the Sunderland Division will be held at the Durham County and Sunderland Eye Infirmary, Sunderland, on Wednesday, April 22nd, at 7.30 p.m., and at the Borough Sanatorium, Hylton Road, Sunderland, on Tuesday, June 23rd, at 3.30 p.m.

**SUFFOLK BRANCH: NORTH SUFFOLK DIVISION.**—By the kind invitation of Dr. Oakden a meeting of the North Suffolk Division will be held at St. Luke's Hospital, South Lowestoft, on Tuesday, April 7th, at 4 p.m. Agenda: Demonstration of methods of the treatment of surgical tuberculosis, by Dr. Oakden.

**SURREY BRANCH: CROYDON DIVISION.**—The annual dinner of the Croydon Division will be held at the Greyhound Hotel, Croydon, on Friday, April 17th, at 8 p.m.

**SURREY BRANCH: GUILDFORD DIVISION.**—A meeting of the Guildford Division will be held at the Royal Surrey County Hospital, Guildford, on Thursday, April 23rd, at 4 p.m., when Mr. Dudley Buxton will read a paper on the treatment of common disabilities of the feet. Tea will be served at 3.45 p.m.

**YORKSHIRE BRANCH: WAKEFIELD, PONTEFRACT, AND CASTLEFORD DIVISION.**—A meeting of the Wakefield, Pontefract, and Castleford Division will be held at the Bull Restaurant, Westgate, Wakefield, on Thursday, April 23rd, at 8.30 p.m., when Mr. J. F. Dobson, F.R.C.S. (Leeds), will read a paper on urological diagnosis (illustrated with lantern slides). Supper at 8 o'clock.

### TABLE OF DATES.

April 11, Sat.	Annual Report of Council appears in SUPPLEMENT.
April 25, Sat.	Last day for receipt of nominations for election of 24 members of Council by grouped Home Branches, and of 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 9, Sat.	Publication in SUPPLEMENT of nominations for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives. Voting papers posted.
May 12, Tues.	Independent motions for A.R.M. Agenda must be received at Head Office by this date.
May 16, Sat.	Last day for receipt of voting papers for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives.
	motions for Representative.
May 30, Sat.	Publication in SUPPLEMENT of results of Council elections by grouped Branches, and of election of members of Council and Representatives in Representative Body by Public Health Service members.
	Nomination papers available for election of 12 members of Council by grouped Home Representatives.
June 4, Thurs.	Names of Representatives and Deputy-Representatives must be received by this date.
June 10, Wed.	Council Meeting

June 18, Thurs. Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.

June 27, Sat. Supplementary Report of Council appears in SUPPLEMENT.

July 3, Fri. Amendments and riders for issue in A.R.M. Agenda must be received by this date.

July 17, Fri. Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.

July 18, Sat. Annual Representative Meeting, Bath.

July 20, Mon. Council, and Annual Representative Meeting, Bath.

July 21, Tues. Annual Representative Meeting. Annual General Meeting, Bath. President's Address.

July 22, Wed. Council, Meetings of Sections, Conference of Honorary Secretaries, Bath.

July 23, Thurs. Meetings of Sections, etc., Bath.

July 24, Fri. Meetings of Sections, etc., Bath.

ALFRED COX, Medical Secretary.

### Meetings of Branches and Divisions.

#### SOUTH WALES AND MONMOUTHSHIRE BRANCH.

The spring meeting of the South Wales and Monmouthshire Branch was held at the Hotel Metropole, Swansea, on March 26th, when the President, Dr. C. A. BRIGSTOCKE (Haverford-west), was in the chair.

#### Results of Insulin Treatment.

After the usual business had been transacted, Dr. A. CLARKE BEGG (Swansea) read a paper on the results of insulin treatment in some two hundred cases of diabetes, with special reference to the problems of diabetic coma. Dr. Begg said he had treated the problems of the course of twenty months; 51 per cent. were males and 49 per cent. females. The ages of the patients varied between 13 and 72 years. In discussing the etiology of the disease he found that heredity played a part in only 7 per cent. The onset was sudden in 6 per cent., and in one case could be attributed to fright. There had been a recent attack of influenza in 5 per cent., and in 2 per cent. there had been an accident shortly before the onset of diabetes. *Symptoms.*—Loss of weight had been a constant symptom; pruritus vulvae was present in most of the female patients; thirst and polyuria were often noted, and nourishment was common, but in no case was there an increase of appetite. The complications were: gangrene, 13 cases (4 deaths); carbuncle, 9 cases (4 deaths); pneumonia, 2 cases (2 deaths); coma, 16 cases (8 deaths); phthisis, 1 case (1 death); boils, 16 cases; cataract, 16 cases; retinitis and albuminuria were sometimes seen. As far as one could ascertain, the average duration of the disease, before the patient reported for treatment, was about six months. Of the total number, 12 had been treated on dietetic lines alone, while 190 had had injections of insulin. As to the course of the disease, 26—that is, 13 per cent. of the cases—were dead (of these a few had been admitted in *extremis*); tolerance had diminished in 29 per cent., had been maintained in 30 per cent., and had increased in 41 per cent. of the remainder. In 5 cases insulin had been discontinued—that is, in 71 per cent. tolerance had been maintained or had increased. *Deductions.*—Dr. Begg mentioned the possible results of sudden cessation of the injections. The necessity of blood tests in certain patients—for example, when a sugar-free urine was obtained—was discussed. Tolerance might be diminished by worry, influenza, boils, etc. Early treatment was essential, and in most cases the urine should be sugar-free in five to six weeks, with dieting, or dieting and insulin. Stout middle-aged women were not good cases for treatment, and the condition of the heart, arteries, and kidneys would influence the prognosis. Coma was then dealt with; Dr. Begg recognized two types: (1) the diabetic coma with acidosis; (2) the post-operative or renal type, where sugar was present in the blood and urine, but no acidosis occurs. In diabetic coma he recommended large doses of insulin (for example, 40 units), the administration of fluids freely, and clearing the bowels.

Dr. J. M. MORRIS demonstrated, among other cases, a cutaneous eruption occurring in a girl who attributed the condition to picking catkins. The distribution of the lesions on the forearms and legs suggested "artefacts." Dr. J. J. HEALY and Dr. A. CLARKE BEGG described a case of pituitary tumour. There had been loss of vision with optic atrophy; vision—R: 3/60, L. less than 1/60. Slight enlargement of the hands and feet had been noticed. Headache and vomiting were absent, but there was a paralysis of the sixth nerve on the left side. Charts and skiagrams were shown. A large tumour was seen obliterating the sella turcica. It was apparently cystic in character, but undergoing calcareous changes.

#### Branch Dinner.

The annual dinner of the Branch was held in the evening, when about sixty members attended; it was a success in every way. The toasts included those of the President, guests, and secretaries. In his reply, the PRESIDENT (Dr. C. A. Brigstocke) mentioned that in his early days as a student at Bart's he had on occasions passed public executions outside Newgate Prison, the bodies being left hanging till 9 a.m. Mr. Cook, the United States consul, was one of the guests of the evening. Musical items were provided.

#### ESSEX BRANCH: SOUTH ESSEX DIVISION.

A MEETING of the South Essex Division was held at the Victoria Hospital, Southend, on February 27th, when Dr. D. G. MACLEON MUNRO, D.C.M.S., gave an address on pulmonary tuberculosis. The meeting, at which Dr. S. G. FLOYD occupied the chair,

was very well attended, but many were unavoidably absent on account of the prevailing influenza. The lecture was greatly appreciated, and a very hearty vote of thanks was accorded to Dr. Munro for attending the meeting and delivering such an instructive address.

Dr. FLOYD compared the present-day treatment of phthisis with that of a generation ago, and thought that there should be legal measures to prevent a person suffering from active tuberculosis from entering the state of matrimony.

Dr. MEACHEN (tuberculosis officer to the county borough of Southend) gave instances of difficult diagnosis in phthisis, and commented on the fact that no mention was made by the lecturer of x-ray examination in the diagnosis of pulmonary tuberculosis. Dr. MUNRO, in reply, said that he did not consider x-ray examination of much value in early phthisis. Drs. HOBGSON and STEPHEN also spoke.

## National Insurance.

### THE ROYAL COMMISSION.

THE twenty-third meeting of the Royal Commission on National Health Insurance was held at the Home Office on March 26th, Sir Andrew Duncan in the chair. Evidence was given on behalf of the Federation Committee of English, Scottish, and Welsh Insurance Committees by the Rev. W. D. Yoward (vice-chairman), Mr. Edwin Potts (honorary secretary), Mr. W. M. Marshall (ex-chairman), and Mr. F. Llewellyn Jones (chairman of the Federation), the administrative work of the Insurance Committees and questions of the extension and improvement of medical and treatment benefits being fully dealt with. Thereafter Mr. Marshall gave evidence on the features peculiar to Scotland and Mr. Llewellyn Jones on the Welsh position. Mr. Eynon Lewis then gave evidence on behalf of the Glamorgan County Insurance Committee, with special reference to the South Wales Medical Institutes.

Proof copies of the oral evidence and the relative statements submitted at the meeting of March 12th may be obtained from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, on remittance of cost (3s.) and postage.

### LONDON PANEL COMMITTEE.

A MEETING of the Panel Committee of the County of London was held, under the chairmanship of Dr. H. J. CARDALE, on March 24th. Dr. C. M. Wilson (St. Mary's) and Mr. A. E. Webb-Johnson (Middlesex Hospital) were appointed to serve on the Committee as representatives of the consulting staffs of medical schools, in place of the late Dr. Lauriston Shaw and Mr. T. B. Layton, resigned.

#### Medical Service Subcommittee.

A solution was reported of the difficulty about the chairmanship of the Medical Service Subcommittee of the London Insurance Committee, whereby the subcommittee's work had been held up for some months. To overtake arrears the Minister has consented to the setting up of a second subcommittee as a temporary measure, and the Panel Committee proceeded to appoint its representatives on both these bodies. On the first subcommittee Drs. H. J. Cardale and E. A. Gregg were appointed, with Drs. J. H. Traquair, A. T. Swan, and A. G. Chase as deputies, and on the second subcommittee Drs. R. L. Bell and W. C. Goodden, with Drs. R. Cock, A. F. Heald, and H. C. Dixon as deputies. To represent the Local Medical Committee Drs. T. M. Ness and P. N. Allman were appointed.

#### Cases Reported by the Medical Service Subcommittee.

The Secretary (Dr. Bateson) gave a summary of the cases reported by the Medical Service Subcommittee during 1924. The number of cases reported was 87, of which 55 were substantiated and 32 not substantiated. Of the cases substantiated, 7 were cases of negligence in treatment, 10 of failure to visit insured persons, 13 of irregular issue of certificates, 5 of charging for drugs or treatment, and the remainder for various breaches of regulations, chiefly having to do with records, prescriptions, and certificates. In 1923 the number of cases reported was 104 (61 substantiated); in 1922, 79 (48); in 1921, 71 (44); and in 1920, 59 (23).

#### Alleged Preference of a Chemist.

The case was brought forward by the Ethical Subcommittee of a practitioner of whom the Pharmaceutical Committee complained that he had influenced insured patients to obtain their medicine from a certain chemist. A similar complaint was made against him a year ago, and was dealt with by correspondence with the London Insurance Committee. Upon inquiry the practitioner stated that he had never recommended his insured patients to go to any particular chemist, but when asked by new patients as to which chemist they should go to he had suggested the names of four whom he knew to be reliable. The secretary was instructed to inform the practitioner that in view of the fact that on a previous occasion had been the subject of complaint to the Insurance Committee, it was advisable that he should have the choice of chemist entirely to his patients,

and, further, that should a complaint of a similar nature be made against him in the future the Committee would feel it necessary to refer the matter to the Medical Service Subcommittee for investigation.

#### Tuberculosis Care Committee.

The Committee agreed upon a resolution to be sent to the London County Council for presentation to the forthcoming Conference of Tuberculosis Care Committees. It ran:

The Panel Committee for the County of London, having had under consideration the question of nominating medical representatives to Tuberculosis Care Committees in the London area, have desired the present representatives to report upon the usefulness of this practice. Judging from such reports, it is felt that the limited scope of duties which are at present allotted to such committees render the regular attendance of medical men unnecessary; but as the London Panel Committee desire to associate themselves in all work of this character having for its object the health and the general well-being of the people of London, they respectfully suggest to the London County Council that these committees should be given a far greater share in the carrying out of all the work connected with tuberculosis.

### LONDON INSURANCE COMMITTEE.

#### Insurance Practitioners' Fines.

At the meeting of the London Insurance Committee on March 26th, the two cases in which a practitioner's treatment of an insured person has been investigated by an inquiry committee constituted by the Ministry of Health (as fully set out in the SUPPLEMENT of March 14th, p. 100, and of March 21st, p. 122) came up for report. The Insurance Committee agreed that in the one case the sum of £10 and in the other the sum of £20 which had been withheld by the Minister from the money payable to the Committee in respect of medical benefit owing to the default of the practitioners referred to, should be recovered from the practitioners by deduction from the remuneration payable to them.

Several other cases were reported at the same meeting in which the Committee, having found a practitioner guilty of breach of the regulations, the Minister had imposed a substantial fine. In one case, in which a practitioner had irregularly supplied drugs to an insured person, and charged fees amounting to 16 guineas therefor, which amount the Committee, in censuring him, had ordered him to refund, the Minister had decided that the sum of £15 must be withheld from the money payable to the Committee in respect of medical benefit, which sum, by the regulations, will be recovered from the practitioner. In another case, in which the Committee had found that the practitioner had failed to attend and treat an insured person, notwithstanding the fact that he was aware that the insured person was sufficiently ill to be confined to bed, and that two requests had been made for treatment, the Minister decided that £5 must be withheld. The letter conveying the Minister's decision stated that the Minister had had regard to the fact that this was the first occasion on which a breach by the practitioner of the terms of service had been brought to his notice, and that he would not feel able to take so lenient a view of the matter in the event of any further dereliction. A similar fine was imposed in another case, in which a practitioner had been censured by the Committee for failure to appreciate the gravity of a case and to make further visits. In a case in which the Committee had found that the practitioner had committed a breach of the terms of service by accepting fees for treatment, and had decided to caution him and to require him to refund the money, the Minister, after taking the practitioner's representations into consideration, decided that no fine should be imposed on this occasion, but that in the event of a further breach no such lenient view could be taken. The Ministry added that the charging of fees to insured persons for services which they were entitled to receive free of charge was calculated to bring the insurance medical service into disrepute.

Some cases were also reported in which the complaint against the practitioner was that he had failed to keep records. A regional medical officer having reported that a practitioner was not keeping records properly, the practitioner was afforded an opportunity of giving an oral explanation, of which he did not avail himself, but sent a communication instead, in which he submitted that the record cards made a great demand on the time of a medical man, and that they were of no advantage to anyone. He had not used the record cards, but had entered the names in a daybook, with some particulars. The Minister decided that a sum of £15 must be withheld in this case, and the letter from the Ministry intimated that in deciding the amount the Minister had had regard to the fact that the rate of remuneration for insurance practitioners was fixed after taking into account the obligation to keep the records in question, and that in fairness to other practitioners, who were keeping records at some inconvenience and expense to themselves, it was not possible to overlook the fact that the practitioner had failed to keep records in the prescribed manner, in spite of having had his attention drawn to the matter by the regional medical officer. Another practitioner, who had failed to return certain

of the forms R.M.2 within the time specified and gave no explanation of the delay, and failed to reply to a communication addressed to him on the matter and to give an oral explanation when invited to do so, was fined £5. The Ministry stated that although requests for information on form R.M.2 were normally issued so as to allow sufficient time for practitioners to make a further examination of the insured person before returning the form, such further examination was not essential, and did not justify failure by the practitioner to return the form by the date specified.

#### Remuneration of Practitioners.

It was reported to the Committee that the Minister had advised that the amount of the Central Practitioners' Fund for 1924 had been finally determined at £5,700,300, of which London's share was £757,741. The Committee had already paid to practitioners during the year £723,483, so that £34,258 remains to be distributed by way of final settlement. The total amount paid to practitioners in respect to each unit of credit for 1924 will be a fraction over 9s. 3d.; in 1923 the amount was 9s. 7d., but the fund for that year was constituted on a capitation fee of 9s. 6d., whereas for 1924 the amount is 9s.

#### Scheme for Testing Medicines.

The Ministry of Health has had under consideration the adoption by Insurance Committees of a uniform scheme for the testing of medicines supplied to insured persons by chemists. A scheme has been prepared after consultation with the Retail Pharmacists' Union and the National Association of Insurance Committees, which provides for the taking of periodical samples of medicine dispensed on insurance prescriptions and for the analysis of the medicines to be supplied to the Committee by analysts to be appointed for the purpose by the Minister. The scheme has the Ministry's approval.

### Correspondence.

#### Disciplinary Powers: An Appeal to the British Medical Association.

SIR,—As one of the four elected representatives of the public health service I attended the Conference of the Representative Body of the British Medical Association and the Local Medical and Panel Committees on March 12th. As such I had had no special instructions from the service as a whole on the Memorandum of Evidence to be submitted to the Royal Commission on National Health Insurance, but held with others "watching briefs." I felt myself debarred, therefore, as a person with a grievance from speaking on the resolution taken on the right of appeal to a court of law of panel practitioners from the Ministry of Health's decisions and disciplinary actions taken on their professional conduct (Supplement, BRITISH MEDICAL JOURNAL, D/16, 1924-25, Sec. (c), paras. 37 and 40).

The question raised was the vital one of whether justice was served best by the Ministry's powers of disciplinary action over insurance practitioners to the extent of inflicting heavy fines and penalties, including removal from the list of panel practitioners, without appeal to a court of justice. The question in my mind was the allied one of the position of the Ministry of Health in the case of the summary dismissal of medical officers of the public health service, without reasons being given or inquiry held, by local authorities. All jurisdiction over such actions is disclaimed by the Ministry of Health on a point of law.

At the meeting on March 12th Dr. Braekenbury claimed that the Ministry of Health is bound by the "terms of the British Constitution" (that elastic but malignant nonentity) to exercise supreme disciplinary powers over insurance practitioners, because it was the Government department responsible for the payment of public moneys, and consequently of their efficient administration. The meeting decided by a narrow majority to accept this view.

Yet we have the opposite attitude taken by the Ministry of Health in repudiating any jurisdiction over the tenure of office of public health servants on the legal reading of their contracts of service with local authorities, which is three months' notice on either side. Notwithstanding in such cases they have their powers under the Sanitary Officers Order, 1922, equally with those over insurance practitioners under the Insurance Acts, equally they are responsible for the efficient administration of public moneys paid (in my case half my salary since 1913), and further, they "approve" our appointments by local authorities. Yet they merely state in my case that they have "no power to review a decision of the corporation on a matter concerning the appointment or to hold an inquiry into the circumstances," though I am an officer of fifteen years in the public health service and fifteen years in the hospital service; am dismissed without reasons given, without inquiry, discredited

professionally in the eyes of the public, and more or less broken financially, at 57 years of age.

It is with the hope that out of this sorry business some good may result to others who may follow me in the future that I appeal to the British Medical Association. I ask the Association to use all its forces and powers as a professional union in this issue, which involves justice and fair play to its members, even to the extent of obtaining a decision from a court of law on the points of jurisdiction involved. Will the British Medical Association be content to leave such vital action to an individual to fight out for the profession?

Although I am content to leave my professional reputation to those who have known my work for thirty years, to the 25,000 or more persons who signed the petition for my reinstatement, and to my dispensary patients whom I serve, yet I am entitled, I claim, in the public interest, to an inquiry before a competent tribunal. Shall a medical officer in the health service seek to serve his employers and his own interests first or his patients' interests?—I am, etc.,

Plymouth, March 25th.

F. G. BUSHNELL.

### Naval and Military Appointments.

#### ROYAL NAVAL MEDICAL SERVICE.

**SURGEON COMMANDER E. T. BURTON** is placed on the retired list with the rank of Surgeon Captain.

**Surgeon Commanders C. M. R. Thatcher** to the *Centaur*, and as Squadron Medical Officer on commissioning as ship of Commodore (D); **P. L. Gibson** to the *Diligence*.

**Surgeon Lieutenant Commanders J. R. Brennan** to the *Diligence*; **W. E. Heath** to the *Fird* for R.N. Hospital, Plymouth; **A. Craig** to the *Columbine*, additional for R.N. Hospital, South Queensferry.

**Surgeon Lieutenants H. A. M. Whitby** to the *Elcheim*; **A. G. L. Brown**, D.S.C., to the *Defiance*; **T. N. D'Arcy** to the *Pembroke*, for R.N. Infirmary, Chatham; **C. Keating** to the *Hood*; **W. Tighe** to the *Herald*.

#### ROYAL ARMY MEDICAL CORPS.

**Major-General T. W. Gibbard**, C.B., C.B.E., R.H.S., late R.A.M.C., having attained the age for compulsory retirement, is placed on retired pay.

**Colonel W. H. S. Nickerson**, V.C., C.B., C.M.G., late R.A.M.C., to be Major-General, vice Major-General T. W. Gibbard, C.B., C.B.E., to retired pay.

**Major G. H. J. Brown**, D.S.O., to be Lieutenant-Colonel, vice Lieut.-Colonel V. J. Crawford, D.S.O., promoted.

**Captain F. K. Escriott** is restored to the establishment and relinquishes the local rank of Major.

#### ROYAL AIR FORCE MEDICAL SERVICE.

**Flight Lieutenant J. C. Johnson** relinquishes his temporary commission on ceasing to be employed.

**Flying Officers D. B. Smith** to Research Laboratory and Medical Officers' School of Instruction, Hampstead, on appointment to a short-service commission, for short course; **T. W. Wilson** to R.A.F. Depot.

#### INDIAN MEDICAL SERVICE.

The services of **Captain G. H. Fraser** are placed temporarily at the disposal of the Government of Bihar and Orissa, for employment as Officiating Superintendent, European Mental Hospital, Ranchi.

The services of **Captain N. Briggs** are placed temporarily at the disposal of the Government of the Punjab for employment in the Jail Department.

**Captain A. C. Craighead** is appointed temporarily to the Medical Research Department and posted as a Supernumerary Officer at the Central Research Institute, Kasauli, with effect from the date he takes over charge.

The services of **Lieut.-Colonel H. C. Stiles-Webb** are placed temporarily at the disposal of the Government of the Central Provinces, with effect from February 14th, 1925.

**Colonel J. A. Black**, Inspector-General of Civil Hospitals, C.P., is granted leave on average pay for five months and twenty-seven days combined with leave on half average pay for a total period of eight months.

**Colonel F. Wall**, C.M.G., R.H.S., and **Lieut.-Colonel H. Emslie-Smith** have retired from the service.

**Captain G. H. N. Baker**, M.C., has been appointed Officer-in-Charge, Medical Store Depot, Rangoon, in addition to his other military duties.

**Lieutenant to be Captain: R. C. Phelps** (February 19th, 1924). (The seniority of this officer in the rank of Captain dates from November 1st, 1916, as notified in the *London Gazette* dated January 19th, 1923.)

**Captains to be Majors: E. Calvert**, R. Sweet, D.S.O., F. Phelan, N. C. Kapur, N. R. Bal, M.C., H. S. G. Haji, M.C.

#### TERRITORIAL ARMY.

##### ROYAL ARMY MEDICAL CORPS.

**Captain R. W. Mavston**, having attained the age limit, is retired, and retains his rank with permission to wear the prescribed uniform.

**W. H. Gratrix** to be Lieutenant.

#### COLONIAL MEDICAL SERVICES.

**Dr. F. G. Rose** appointed Deputy instead of Assistant Health Officer for Port of Georgetown, British Guiana. **Drs. H. Fairbairn**, T. Langan, and C. R. Steel appointed Medical Officers, Tanganyika Territory. **Dr. J. Williamson** appointed Medical Officer, Tanganyika Territory (sleeping sickness duty). **Drs. G. A. Sloan** and S. Forrest appointed Medical Officers, Uganda. **Dr. G. Fitzpatrick**, M.O., Tanganyika, transferred from Morogoro to Singida. **Dr. J. F. Corson**, M.O., transferred from Nigeria to Tanganyika.

## VACANCIES.

**BRIGHTON:** ROYAL ALEXANDRA HOSPITAL FOR SICK CHILDREN.—House-Surgeon. Salary £100 per annum.

**BRIGHTON:** ROYAL SUSSEX COUNTY HOSPITAL.—(1) Honorary Physician. (2) Honorary Assistant Physician.

**BRISTOL:** HOSPITAL FOR MENTAL DISORDERS AND NERVOUS DISEASES, 72, Camden Road, N.W.1.—Honorary Physician.

**CILDENSTONES INSTITUTION FOR MENTAL DEFECTIVES,** Whalley, near Blackburn.—Temporary Assistant Medical Officer. Salary £300 per annum.

**CORRY MENTAL HOSPITAL,** Mickleover, near Derby.—Junior Assistant Medical Officer (male). Salary £350 per annum, rising to £450, and £50 extra for D.P.M.

**DERBY CITY BOROUGH:**—Resident Medical Officer (male) at the Isolation Hospital and Sanatorium. Salary £550 per annum.

**DERBY:** DERBYSHIRE ROYAL INFIRMARY.—House-Surgeon. Salary £200 per annum.

**DEWBURY COUNTY BOROUGH:**—Medical Officer of Health. Salary £500 per annum.

**DURHAM COUNTY AND SUNDERLAND EYE INFIRMARY:**—House-Surgeon. Salary £450 per annum, rising to £550.

**EDINBURGH:** ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN.—Vacancy on the Surgical Staff.

**FULHAM:** PULMONARY INFIRMARY.—Third Assistant Medical Officer (male). Salary £250 per annum, rising to £300.

**HOSPITAL ET DISPENSIRE FARMIS,** 172, Shaftesbury Avenue, W.C.2.—Physician to Out-patients.

**HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST,** Brompton, S.W.3.—House-Physician. Honorarium £50 for six months.

**HOSPITAL FOR DISEASES OF THE THROAT,** Golden Square, W.1.—Honorary Surgical Registrar.

**LEDS PUBLIC DISPENSARY:**—Junior Resident Medical Officer. Salary £150 per annum.

**LIVERPOOL EYE AND EAR INFIRMARY:**—House-Surgeon (male). Salary £100 per annum.

**LONDON LOCK HOSPITAL,** 91, Dean Street, W.1.—House-Surgeon at the Male Lock Hospital. Salary £200 per annum.

**LOWESTOFT AND NORTH SUFFOLK HOSPITAL:**—House-Surgeon. Salary £150 per annum.

**MANCHESTER ROYAL INFIRMARY:**—Assistant Resident Surgical Officer. Salary at the rate of £150 per annum.

**MANCHESTER UNIVERSITY:**—Lecturer in Bacteriology. Stipend £500 per annum.

**MINISTRY OF HEALTH:**—Deputy Regional Medical Officers (twelve for England and one for Wales).—Remuneration £800 per annum, rising to £1,100.

**MINISTRY OF PENSIONS HOSPITAL,** Kirkburton, near Huddersfield.—Senior Medical Officer. Salary £600 per annum.

**NEWCASTLE-UPON-TYNE CITY AND COUNTY:**—Tuberculosis Medical Officer. Salary £750 per annum, rising to £900.

**NEWCASTLE-UPON-TYNE CITY HOSPITAL FOR INFECTIOUS DISEASES:**—Resident Medical Assistant (male). Salary £350 per annum.

**OLDHAM UNION:**—Resident Assistant Medical Officer. Salary £300 per annum.

**PRINCE OF WALES'S GENERAL HOSPITAL,** Tottenham, N.15.—(1) Honorary Medical Registrar. (2) Honorary Surgical Registrar. (3) Honorary Assistant Surgeon to the Ear, Nose, and Throat Department. Honorarium for (1) and (2) £200 per annum.

**POTNEY HOSPITAL,** S.W.15.—Resident Medical Officer (male). Salary £150 per annum.

**QUEEN CHARLOTTE'S MATERNITY HOSPITAL,** Marylebone Road, N.W.1.—Obstetric Surgeon to Out-patients.

**ROYAL CHEST HOSPITAL,** City Road, E.C.1.—(1) Physician with charge of out-patients. (2) Resident Medical Officer; salary at the rate of £150 per annum.

**SHEFFIELD ROYAL INFIRMARY:**—House-Surgeon. Salary £80 per annum.

**SHEFFIELD UNIVERSITY:**—Assistant Pathologist at the Royal Hospital and Demonstrator of Pathology in the University. Salary £500 per annum.

**WEST END HOSPITAL FOR NERVOUS DISEASES,** Welbeck Street, W.—Honorary Registrar.

**WINCHESTER:** ROYAL HAMPSHIRE COUNTY HOSPITAL.—Sister Tutor. Salary £150, rising to £150.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column advertisements must be received not later than the first post on Tuesday morning.

## APPOINTMENTS.

**BEATTIE,** Neil R., M.D.Durh., B.M., D.P.H., Assistant Port Medical Officer, Southampton.

**DODDS,** R. L., M.B., B.Ch., Resident Medical Officer to the Freemasons Hospital and Nursing Home, Fulham Road, S.W.3.

**FRENCH,** Ernest G., M.D., F.R.C.S.E., M.R.C.P.Lond., Dermatologist to the London Temperance Hospital.

**MCMILLAN,** Kenneth, F.R.C.S.Eng., Honorary Surgeon to the Birmingham and Midland Hospital for Women and Honorary Assistant Surgeon to the Birmingham Maternity Hospital.

**SINCLAIR,** A. H. H., M.D., Medical Referee under the Workmen's Compensation Act for the districts of Edinburgh City, Midlothian County, Orkney Islands, Linlithgow County, and Peebles County for Ophthalmic Cases.

**TRENTER,** Adam A., M.C., M.B., Ch.B.Aberd., Medical Officer of Health for Finchley.

**QUEEN CHARLOTTE'S MATERNITY HOSPITAL,** Marylebone Road, N.W.1.—Resident Medical Officer: A. J. Storey, M.A., M.B., B.Ch. Assistant Resident Medical Officer: Roy M. Saunders, M.B., Ch.B., Robert Foote, M.R.C.S., L.R.C.P.

**CERTIFYING FACTORY SURGEONS:**—J. E. Cable, M.B., Ch.B.Aberd., for the Forfar District, co. Forfar; A. W. Ewing, M.R.C.S., L.R.C.P., for the Buntingford District, co. Hertford; J. Warnock, M.D., R.U.L., for the Leeds (South) District, co. York.

## DIARY OF SOCIETIES AND LECTURES.

**ROYAL SOCIETY OF MEDICINE.**  
**War Section:** Mon., 4.30 p.m., Annual General Meeting. Colonel J. Crawford Kennedy, R.A.M.C.; Tuberculosis in the Army. Surgeon-Commander C. H. Dawe, R.N.; Tuberculosis in the Navy. War Commander H. A. Treagold, R.A.F.; Tuberculosis in the Royal Air Force.  
**Section of Orthopaedics:** Tues., 8.30 p.m., Discussion: Differential Diagnosis of Non-tuberculous Cystitis in Children and Adolescents; to be opened by Mr. Alan Todd, followed by Mr. R. C. Elmie and Mr. H. A. T. Fairbank.

**ROYAL SOCIETY,** 32, Welbeck Street, W.1.—Tues., 8.15 p.m., R. Croft Rogers: Organization and Equipment of X-ray Rooms arranged for Private Radiologists; G. T. Longborough: Acute X-ray Burns.

## POST-GRADUATE COURSES AND LECTURES.

**WEST LONDON HOSPITAL POST-GRADUATE COURSE:** Hammersmith W.—Mon., 12 noon, Applied Anatomy. Tues., 1 p.m., Surgical Wards. Thurs., 2 p.m., 10 a.m. to 5 p.m., Sat. 10 a.m. to 1 p.m., Special Departments.  
**GLASGOW POST-GRADUATE MEDICAL ASSOCIATION:**—At Ophthalmic Institution: Wed., 4.15 p.m., Eye Cases.  
**MANCHESTER ROYAL INFIRMARY:**—Tues., 4.15 p.m., Benign Swellings of the Breast.

## British Medical Association.

OFFICES AND LIBRARY, 122, STRAND, LONDON, W.C.2.

## Reference and Lending Library.

**THE READING ROOM,** in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.  
**LENDING LIBRARY:** Members are entitled to borrow books, including current medical works; they will be forwarded if desired, on application to the Librarian, accompanied by 6d. for each volume for postage and packing.

## Departments.

**SUBSCRIPTIONS AND ADVERTISEMENTS** (Financial Secretary and Business Manager. Telegrams: Articulate Westrand, London).  
**MEDICAL SECRETARY** (Telegrams: Medisera Westrand, London).  
**LONDON:** British Medical Journal (Telegrams: Articulate Westrand, London).  
 Telephone number for all departments: Gerrard 2530 (5 lines).

**SCOTTISH MEDICAL SECRETARY:** 6, Rutland Square, Edinburgh. (Telegrams: "el," 4261 Central).  
**IRISH MEDICAL SECRETARY:** Frederick Street, Dublin. (Telegrams: 4737 Dublin).

## Diary of the Association.

- 3 Fri.** Chesterfield Division: Maternity Hospital, Chesterfield. B.M.A. Lecture on Some Recent Advances in Endocrinology by Dr. A. L. Gow, 8.30 p.m.
- 5 Sun.** Mid-Cheshire Division: Altrincham General Hospital. Lecture by Dr. Meredith Young on the Public Health Services, 4 p.m. Tea, 3.45 p.m.
- 6 Mon.** London: Standing Ethical Subcommittee, 2.30 p.m.
- 7 Tues.** Coventry Division: Coventry and Warwickshire Hospital. Lecture by Dr. Harrison Butler on Modern Methods of Examining the Living Eye, 8.30 p.m.
- North Suffolk Division:** St. Luke's Hospital, South Lowestoft. Demonstration by Dr. Oakden of Methods of Treatment of Surgical Tuberculosis, 4 p.m.
- South-West Essex Division:** Claybury Mental Hospital, Woodford Bridge, Woodford Green, 3.30 p.m. Paper by Dr. C. F. Barham on the Latest Treatment of General Paralysis of the Insane by Inoculation with Malaria, 4.15 p.m.
- 8 Wed.** Bath and Bristol Branch: Cottage Hospital, Wells. B.M.A. Lecture by Dr. W. A. Brend on the Legal Obligations of the Medical Man, 3.30 p.m.
- 14 Tues.** City Division: Metropolitan Hospital, Kingsland Road, E.8. Paper by Dr. H. Maclean on Diabetes—its Treatment: Insulin up to Date, 8.30 p.m.
- 15 Wed.** Norfolk Branch: Norfolk and Norwich Hospital. Address by Dr. W. Norwood East on the Interpretation of Some Sexual Offences, 3.30 p.m.
- South Middlesex Division:** St. John's Hospital, Twickenham. General Business, 8.15 p.m.; Paper by Dr. H. C. Corry Mann on Dietary during the School Age, 8.30 p.m.

### Preliminary.

#### ANNUAL MEETING AT BRADFORD, 1924.

1. The Council has expressed to the President, Mr. Basil Hall, the Honorary Local Secretary, Dr. W. N. West Watson, their medical colleagues and the many lay persons and authorities in Bradford who co-operated with them, the hearty thanks of the Association for their successful efforts to make the Annual Meeting of 1924 a worthy successor in a long line of successful events. The Meeting was from every point of view a credit to our Yorkshire colleagues and a lasting source of pleasure to those who attended it.

#### ANNUAL MEETING AT BATH, 1925.

2. The Annual Meeting, 1925, commences at Bath with the A.R.M. on Friday, July 17th. It will be under the Presidency of Dr. F. G. Thomson, and the Association is assured of a warm welcome, not only from the President and his colleagues, but from the City authorities, who have shown their desire to make the meeting memorable in the annals of the Association and worthy of the hospitable record of the City of Bath.

#### HONOURS.

3. The Council has pleasure in announcing that during the present session honours have been conferred upon the

following Members, to whom the congratulations of the Association have been sent:—

#### K.C.V.O.

Sir Henry John Forbes Simson, F.R.C.S.Ed.

#### D.B.E.

Miss Louisa B. Aldrich-Blake, M.S.

#### Knighthood.

Mr. John Campbell, F.R.C.S.

Professor Frederick Gowland Hopkins, F.R.S.

Dr. Thomas Morison Legge, C.B.E.

Major-General Robert Charles MacWatt, C.I.E., I.M.S.

Dr. Frederic Truby King, C.M.G.

#### OBITUARY.

Sir Clifford Allbutt and Dr. G. E. Haslip.

4. The Association has suffered exceptionally during the past year by the loss of a much loved and honoured ex-President, Sir Clifford Allbutt, and the late Treasurer, Dr. G. E. Haslip. Full of years and honours Sir Clifford Allbutt was not less fortunate in the admiration and affection with which he inspired everyone who came into close personal contact with him. Among his many activities he himself ranked high his close connection with the Association. He was

President for five years, a longer period of office than has fallen to the lot of any other man, and during that time, as for many years previously and right up to the time of his death, he took so active part in the ordinary work of the Association. The Association was indeed fortunate in having for so many years the wise counsel and gracious influence of one who was universally regarded as a great physician and a great man.

Dr. Haslip's untimely death was mourned by all members of the Association for which, as Honorary Treasurer 1916-1924, he worked with a zeal and devotion rarely equalled in the history of the Association. His period of office, coinciding as it did with the death of Mr. Guy Elliston, late Financial Secretary, and with the period of the war, was one of exceptional strain and responsibility which to the great gain of the Association he cheerfully bore.

5. The Association has to deplore the loss of the following Members:—

Naoie.	Offices held in the Association.	
The Right Hon. Sir Thomas Clifford Allbutt, P.C., K.C.B.	President 1915-1921. An early Member of the old Committee of Council; Address in Medicine, 1883; Secretary, 1869, Vice-President, 1878, and President 1882 and 1889, of Section of Medicine	Dr. Clement Dukes ... A former President of the South Midland Branch and at one time Chairman of the Northamptonshire Division

Leckie Coullie, R.N., Mr. John Batten Coumbe, F.R.C.S., Dr. Alan Osborne Courts, Dr. Alfred Cowen, Dr. John Craig, Dr. Egbert Aubrey Lennox Crichtlow, Dr. Sarah Davidson, Dr. Frank Aaron Davies, Dr. Wm. Henry Davies, Dr. Henry George Denny, Dr. Armand de Waterville, Dr. James Thomson Dick, Dr. Lillian Mary Dingle, Dr. Kildare Dixon Borrowes Dobbs, Dr. Thomas Wm. Hardwicke Downes, Dr. Ernest Paul Duncan, Dr. Salv. Ellul-Grech, Dr. Frank Elvy, Dr. Edward Henry Embley, Dr. Joseph Patrick Fagan, Dr. Thomas McCraith Foley, Dr. Edith Emily Fox, Dr. James Alfred Frost, Dr. John Frederick Gordon, Dr. David Craigie Gray, Surg. Capt. Henry Wm. Gordon-Green, O.B.E., R.N. (Ret.), Capt. David Hamilton Hadden, M.B.E., M.C., R.A.M.C., Dr. Robert Hardwick Hall, Dr. Lillian Hamilton, Dr. Wm. Hammond, Dr. Maurice Gilbert Hannay, Dr. Wm. Hanway, Dr. Cecil Randle Harper, Dr. Rowland Edward Harrold, Dr. James Willis Heslop, Dr. Wm. Elisha Huff-Hewitt, Dr. Knikhasu M. Hira-Manek, Dr. Frederick Wm. Hobbs, Dr. Joseph Duncan Howe, Prof. John Irvine Hunter, Dr. Arthur Gerard Cheyne Irvine, Dr. Henry Grattan Johnston, Dr. John Harris Jones, Dr. Wm. Morris Keal, Dr. Michael Wm. Kelly, Dr. John Reginald Lambert, Dr. Henry Christopher Lampport, Dr. Gordon Abercromby Lang, Dr. John Lascelles, Dr. Alfred Lawther, Dr. Basil Stanley Llewelyn, Dr. Wm. Gibbs Lloyd, Dr. Thomas Valient Loekhart-Mure, Dr. David Sanderson Long,

Dr. John Reginald Long, Dr. Wm. Low, Capt. Donald Hector Colliu McArthur, O.B.E., R.A.M.C., Dr. Wm. Neil MacCall, Dr. Eugene Charles McCarthy, Dr. Wm. McDonald, Dr. Lucius Gerald Armstrong MacDonnell, Sir James Mackenzie, Dr. John Mackenzie, Dr. George Douglas Mackintosh, Dr. James MacMunn, Dr. Oliver Henry Arthur Maggs, Dr. Reginald Maples, Surg.-Capt. Horace Bruce Marriott, R.N. (Ret.), Fleet-Surg. Wm. Ernest Marshall, R.N. (Ret.), Dr. James Mason, Dr. Wm. Harrap Mason, Dr. James Wm. Mathewson, Dr. Jhangir Manchershah Meher-Homjee, Dr. Joseph Aloysius Mescall, Dr. David Gregg Metheny, Dr. John Arthur Mills, Dr. Alfred Wm. John Catto Mitchell, Dr. Robert Mitchell, M.B.E., Dr. Jan Marcus Moll, Lt.-Col. Anthony Hickman Morgan, D.S.O., Dr. Edward Hume Morgan, Dr. Reginald Arthur Morrell, Dr. Wm. Robert Nattle, Mr. Thomas Stanley North, F.R.C.S., Dr. Edward Nundy, Dr. John Lewis Owen, Dr. John Wm. Owen, Dr. Wm. Arnot Parker, Dr. John Frederick Fitzgerald Parr, Dr. Charles Octavius Parsons, Dr. Dosabhai Kavasji Patel, Mr. Wm. Bromfield Paterson, Dr. Pantaleon Pelletier, Dr. Charles James Pentland, Dr. Alfred Herbert Peters, Dr. James Farquharson Powell, M.C., Dr. Wm. Graham Putnam, Dr. Eric Burton Reed, Sir Sidney Russell Wells, M.P., Lt.-Col. David Wilson Scotland, I.M.S. (Ret.), Dr. Edward Henry Scott, Dr. Gerald Affleck Scott, Dr. Arthur George Shurlock, Dr. Wm. Henry Simmons, Dr. Francis Odell Simpson, Dr. Thornton Gerald Simpson, Dr. Edmund Moody Smith, Dr. Ferdinand Clarence Smith, Dr. Matthew Baird Smith, Dr. Harold Spurway, Dr. Charles Turner Standring, D.S.O., Dr. John Steel, Dr. Duncan Stewart, Dr. Percy Peter James Stewart, Dr. Frederick Arnott Storr, Dr. John Porter Tannoek, Dr. John Taylor, Dr. John Caldwell Thomas, Dr. George Augustus Thompson, Dr. James Leonard Timothy, Dr. Wm. Fentham Todd, Dr. Charles Molesworth Tuke, Dr. John Grainger Brown Turnbull, Dr. Jalejar Rustamji Vakil, Dr. Henry Charles Varley, Dr. Jerome Stephen Vassalli, Dr. Arthur John Vause, Dr. John Walker, Dr. Henry Craig Wallace, Dr. Wm. Bain Walton, Dr. George de Bourbonlon Watson, Dr. Percy Whitehead, Dr. Noel Stewart Whitten, Dr. John David Williams, Dr. Frank Walter Ernest Wilson, Dr. Gilbert Osborne Wood, Dr. John Maxwell Wood, Dr. Robert Wood, Dr. Arthur George Worrall, Dr. Alexander Wylio, Dr. Andrew Stewart Young.

## ATTENDANCES.

6. The Council submits in Appendix I, a list of attendances at meetings of the Council from the termination of the Annual Representative Meeting, 1924, to March 31st, 1925.

## ANNUAL MEETING, 1926.

7. In connection with the Annual Meeting at Nottingham, the Nottingham Division has nominated Mr. Robert George Hogarth as President for 1926-27.

The Council recommends:—

**Recommendation:** That Mr. Robert George Hogarth, C.B.E., F.R.C.S.Eng., be elected President of the Association for 1926-27.

## ANNUAL MEETING, 1927.

8. Invitations for the Annual Meeting have been received as follows:—Manchester, the date left to the discretion of the Council; Cardiff, as soon as possible after 1927; Edinburgh, 1927; Bournemouth, at an early date; and Winnipeg.

The Council is of opinion that the Association should accept the invitation of the Edinburgh Branch for 1927, which year is the centenary of the birth of Lord Lister whose connection with Edinburgh is historic. The Association last met in Edinburgh in 1898.

The Council recommends:—

**Recommendation:** That the Annual Meeting, 1927, be held at Edinburgh.

**NOMINATION OF MR. C. P. CHILDE, F.R.C.S., AS VICE-PRESIDENT.**

9. The Council recommends:—

**Recommendation:** That Mr. C. P. Childe, B.A., F.R.C.S., M.R.C.P.E. (President of the Association, 1923-24), be elected a Vice-President of the Association under Article 39 and By-law 73 as a recognition of his services as President of the Association during the year 1923-24.

## PRESIDENT'S VISIT TO CANADA AND THE UNITED STATES OF AMERICA.

10. The Council has great pleasure in reporting that the President has accepted an invitation to attend the Annual Meeting of the Ontario Medical Association (a constituent body of the Canadian Medical Association) in May, 1925, and, at the request of that body, will deliver an address before the Academy of Medicine of Toronto. The President has also consented, on the invitation of the American Medical

Association, to represent the Association at the Annual Meeting of that body at Atlantic City. He will carry with him to our Canadian and American colleagues the best wishes of the Association for the continued success of their organisations and the growth of cordial relations between the professions of the old and new countries.

PRESENTATION OF THE GOLD MEDAL OF THE ASSOCIATION TO  
DR. R. A. BOLAM.

11. The Council has decided to present the Gold Medal of the Association to its Chairman, Dr. Robert Alfred Bolam, for his distinguished services to the Association and the medical profession and in special commemoration of his work in connection with the acquisition of the new House of the Association, 1924-25.

In taking this step the Council knows that it will have the cordial approval of the members of the Association, for Dr. Bolam has gained the confidence and affection of the Association to a degree not surpassed by any of his eminent predecessors. These who are most familiar with the extraordinary combination of business acumen, driving force and persuasion which the Chairman of Council has devoted, first to the discovery, then to the acquisition and preparation of the new House of the Association, will best appreciate the peculiar appropriateness of the award of the Medal at this particular juncture.

## REPRESENTATION OF THE ASSOCIATION ON OUTSIDE BODIES.

12. The following appointments upon outside bodies have been made by the Council during the year:—Council of Society of Medical Officers of Health, Drs. T. Ridley Bailey and C. E. S. Flemming; Professional Classes Aid Council, Mr. N. Bishop Harman (Treasurer); Joint Committee on Tuberculosis, Drs. G. B. Hillman and A. Lyndon.

## MEDICAL BENEVOLENT FUNDS.

13. A Special Committee has been appointed to consider and report upon Minute 52 of the A.R.M., 1924, concerning the above question, but owing to the pressure of other business it has not yet met. The Council hopes to be in a position to report hereon in the Supplementary Annual Report.

## SMOKE ABATEMENT LEAGUE OF GREAT BRITAIN.

14. The Council appointed Drs. I. W. Johnson and Frank Radcliffe as delegates to attend the Manchester Conference of the Smoke Abatement League at Manchester in November last and agreed to the Association being included among the Patrons of the League.

CONGRATULATIONS TO DR. COURTENAY LORD ON SUCCESSFUL  
EFFORTS IN LIFE-SAVING.

15. The Council has had great pleasure in putting on record its admiration of the courageous action of Dr. C. Courtenay Lord, Assistant Medical Secretary. Dr. Lord during the Christmas holidays, at Stokesay Bridge, Shropshire, on December 28th, 1924, took the leading part in saving the lives of two persons who were in danger of drowning and in the rescue of a third person who afterwards died.

## OPENING OF THE NEW HOUSE OF THE ASSOCIATION.

16. Arrangements for the official opening of the new House of the Association are under way but are not sufficiently settled to allow of any more definite announcement than that the opening will be in the early part of the week commencing July 13th, 1925. The Council has appointed a special Reception Committee, which consists, in addition to representatives of the Council, of the President of the Royal College of Physicians of London, the President of the Royal College of Surgeons of England, Lord Dawson of Penn, Dame Louisa Aldrich-Blake (Dean of the London School of Medicine for Women), and the President of the Metropolitan Counties Branch of the Association. The Committee has power to co-opt additional members if thought desirable.

17. The Council has issued special invitations to each Oversea Branch of the Association, the Australian Federal Committee and the South African Committee, asking those bodies to send official delegates to the function; also to the Canadian Medical Association and the American Medical Association, and is glad to report that each of these bodies intends to send representatives. As to this a fuller statement will be made in the Supplementary Report of Council. A special invitation was sent also to Sir G. A. Syme, who was President of the first Australasian Medical Congress held under the auspices of the Association in 1923, but Sir George was unfortunately unable to accept the invitation as he has recently been appointed to a Royal Commission which will require his presence in Australia.

18. It has been decided to make the July 18th issue of the *Journal* a "Commemorative Number" with a special plate

showing the frontispiece of the "Book of Honour" and an illustration of the Memorial Gates of the new premises. Copies of the "Book of Honour" are being prepared on art paper for distribution at the Opening Ceremony, to the relatives of the fallen and to those members who desire them. The "Book of Honour" itself is to be placed in the Library, and a tablet of art bronze will be placed in the Entrance Hall stating where the "Book of Honour" is to be found.

#### GIFT FROM THE AUSTRALIAN BRANCHES FOR THE NEW B.M.A. HOUSE.

19. The Council has great pleasure in announcing a most kindly and gracious offer by the Australian Federal Committee of a Presidential Chair for the Great Hall in the new House of the Association. The idea of the Australian Federal Committee is that the Chair should be made of Australian timber with something about it emblematic of Australia. The High Commissioner for Australia is, on the suggestion of the Federal Committee, kindly taking a practical interest in this question, and it is believed that the result will be a production of which both the Association and its Australian Branches may feel proud.

#### NEW ARRANGEMENTS AS REGARDS THE PRINTING OF MINUTES OF COUNCIL AND COMMITTEES, ETC.

20. The Council has been taking into serious consideration the possibility of an economy in the production of the Minutes of the Representative Body and of the Council and Committees. So far as the last-named are concerned, with the exception of the Finance Committee, the printing of all Agenda and Minutes will be discontinued and they will in future be stenilled. As to the daily Minutes of the Representative Body it is suggested that in future they be typewritten while the Meeting is in session and reproduced in lithographic form for circulation to the members of the Meeting each day; that sufficient copies of the lithographed Minutes be bound for office use; and that the subsequent printing and issue of the Minutes to Representatives and Secretaries of Divisions and Branches be discontinued, the need for this having disappeared with the printing each year of the Summary of the proceedings of the R.B. in the Supplement to the B.M.J. and the issue of the Association Handbook. The Council has suggested to the Chairman of the R.B. that he should move the A.R.M. at Bath to amend Standing Order 18 of the R.B. accordingly. It is believed that by carrying out the above-mentioned procedure considerable economies can be effected without any inconvenience.

### Finance.

21. The Financial Statement for the year ending December 31st, 1924, which will appear in the B.M.J. Supplement of April 18th, 1925, discloses a state of affairs giving cause for quiet satisfaction.

22. The forecast for the year 1924 published in the Annual Report of Council for 1923-24 showed an estimated surplus for the year of £5,500; the actual surplus realized as shown by the books was £8,923, a result accounted for almost equally by increases over the estimates in the revenues from subscriptions and advertisements.

23. The membership increased during the year by 2,319, the total of 28,431 constituting a record.

24. The income for the past three years has been as follows:

	£	s.	d.
1922	112,140	18	3
1923	117,509	15	3
1924	122,840	0	3

The expenditure for the same three years was:

	£	s.	d.
1922	102,337	5	3
1923	107,726	15	0
1924	113,917	0	0

#### BALANCE SHEET.

##### Liabilities.

25. The Sundry Creditors stand at a total very similar to that of last year.

The Reserve Account stands at the same figure as last year. It is invested in first-class securities of a market value at 31st December, 1924, of £29,683 10s.

The Surplus Account, including the surplus for the year 1924, stands at £143,601 8s. 9d., making with the Reserve Account a total of £170,848 6s. 3d.

**Loan Account.**—It will be observed that, although a sum of £12,370 has been paid to the contractors on account of completions and decorations at the New House of the Association in Tavistock Square, it has been possible by careful financing to make such payments without increasing the loan from the Bank. A sum of £18,000 was repaid to the Bank by January 23rd, 1925.

##### Assets.

26. **Freehold Premises.**—The usual depreciation of £1,250 has been written off the value of the Strand premises.

**Leasehold Premises.**—A sum of £3,208 has been charged to Profit and Loss Account in respect of expenditure at the New House, and a first £1,000 has been written off for depreciation.

**Subscriptions in Arrear.**—The subscriptions carried forward in arrears have decreased, the number being 1,372 at 31st December, 1924, as against 1,496 at 31st December, 1923. This item of £2,120 7s. 9d. is represented almost entirely by subscriptions of Overseas Members, which may have been paid to the Branch Secretaries abroad, but have not reached the Head Office before the end of the year.

#### INCOME AND EXPENDITURE ACCOUNT.

27. **Subscriptions.**—The subscriptions due for the current year show an increase of £4,268, due to the great increase in membership during 1924. The subscriptions due for previous years which have been recovered in the year under review have again been shown separately, in order to demonstrate that the amounts shown as "subscriptions written off" are by no means lost. Of the sum of £2,481 carried forward in the Balance Sheet of 31st December, 1922, as "Subscriptions in Arrears," no less a sum than £2,229 was recovered during 1923. The balance of £252 was included in the amount of £2,150 5s. 8d. "written off" in the Profit and Loss Account at 31st December, 1923. A further sum of £107 8s. 6d. was received during 1924, which, together with the £1,327 14s. 10d. collected by the Head Office in respect of 1923 subscriptions written off, and £205 6s. 9d. recovered in respect of previous years' subscriptions, makes a total recovery of 627 subscriptions, representing £1,640 10s. 1d.

**Interest on Investments** shows a decrease of £187, no interest having been received upon Bank Deposits.

**Sundry Receipts.**—This figure of £924 includes repayments of amounts expended during 1923 from the National Insurance Defence Trust and the estate of the late Sir William Macewen.

#### TRUST FUNDS.

28. **Office Staff Superannuation Fund.**—It may be noted that the market value of the stock owned by this fund on 30th December, 1924, was £13,121 3s. 11d.

#### APPORTIONMENT OF MEMBERS' SUBSCRIPTIONS.

29. The membership of the Association at the end of 1924 was 28,431, but it must be borne in mind that all members do not now pay the same rate of subscription. Therefore the average amount of revenue per member was less than £3 3s.

The total revenue from subscriptions (excluding arrears) was £68,088 for the year 1924, or roughly £2 7s. 10d. per head of membership.

The following table has been calculated on this basis to show how the subscription of a member was apportionable towards defraying the expenses of the Association for the year ending December 31st, 1924:

	£	s.	d.	1924.	£	s.	d.	1923.
Central Meetings Expenses ...	8,937	0	6	3	0	6	4	0
General Association Expenses ...	4,219	0	3	0	0	3	8	0
Central Staff Expenses ...	15,802	0	11	1	0	11	3	0
Central Premises Expenses ...	3,951	0	2	9	0	3	9	0
Central Printing, Stationery, and Postages ...	3,074	0	2	2	0	2	2	0

	£68,088	£2	7	10	£2	8	10	

In comparison with last year's figures it will be seen that the reduction in "Part Surplus" has been transferred to "New Building" and "Depreciation."

## Report of Council :

ESTIMATE OF RECEIPTS AND EXPENDITURE IN 1925.  
30. The following figures represent an approximate forecast of the possible revenue and expenditure for the current year :

Receipts.		1924.		1925.	
	£		£		£
Subscriptions ...	69,728	2,072 Increase ...	71,800		
Advertisements...	39,437	1,063 Increase ...	40,500		
Sale of JOURNALS, etc.	8,587	87 Decrease ...	8,500		
Investments and Rents	4,163	37 Increase ...	4,200		
Sundry Receipts ...	925	925 Decrease ...	—		
	<u>£122,840</u>		<u>£125,000</u>		

Expenditure.		1924.		1925.	
	£		£		£
Central Meetings Expenses ...	8,937	1,313 Increase ...	10,250		
General Association Expenses	4,219	219 Decrease ...	4,000		
Central Staff Expenses ...	15,802	1,193 Increase ...	17,000		
Strand Premises Expenses ...	3,960	1,460 Decrease ...	2,500		
Central Printing, Stationery, and Postages ...	3,074	201 Increase ...	3,275		
Library Account ...	969	81 Increase ...	1,050		
JOURNAL Account ...	59,521	2,479 Increase ...	62,000		
Irish Committee Expenses ...	1,112	38 Increase ...	1,150

Estimated Surplus, 1925 ...	£4,000

## Organisation.

## MEMBERSHIP FIGURES.

31. The following is a summary of the changes in the membership of the Association during 1924 (the figures for 1923 are given for comparison) :—

1923.		1924.	
New members ...	2,791	New members ...	3,287
Paid arrears... with...	758	Paid arrears... with...	770
Resignations drawn ...	45	Resignations drawn ...	26
	<u>3,597</u>		<u>4,083</u>
Resignations ...	475	Resignations ...	436
Deaths ...	288	Deaths ...	326
Arrears ...	1,003	Arrears ...	1,000
Eased from Medical Register ...	1	Eased from Medical Register ...	2
	<u>1,767</u>		<u>1,764</u>
	1,830		2,319
INCREASE ...	1,830	INCREASE ...	2,319
Membership, December 31st, 1923 ...	26,112	Membership, December 31st, 1924 ...	28,431

The Council is gratified to report that the above membership of 28,431 is higher than the previous highest figure (year 1912) by 1,868.

WORK DONE BY THE DIVISIONS AND BRANCHES IN 1924.  
32. The year 1924 has been one of the most active in the history of the Association. Not only has the membership increased in a highly satisfactory way, but the activities of the Association, local and central, clinical and scientific, medico-political, and social, have developed in all directions.

33. The Council takes special pride in referring to the splendid work now being done by a great many of the Divisions and Branches and by the Australian and South African Federal Committees, as evidenced (*inter alia*) by the reports published in the *Supplement* of the meetings held. An increasing number of Divisions and Branches are adopting, with conspicuous success, the sound plan of arranging in advance a programme for each session, October to October.

THE HONORARY OFFICERS OF THE DIVISIONS, BRANCHES AND FEDERAL COMMITTEES.

34. On behalf of the Association the Council desires warmly to thank the Chairmen, Presidents, Secretaries and Executives of

the Divisions, Branches and Federal Committees for the admirable work being done. While the central work of the Association is increasingly strenuous, the Council well realises that no central efforts can be expected to take the place of the activities of members in their own districts.

## HELP TO INDIVIDUAL MEMBERS.

35. A marked feature of the central work in the year has been the steady increase in the number of applications received from individual members for information, advice, or other help. It will be remembered that besides the information in the possession of the Central Committee, the Intelligence Department of the Association collects, records, and disseminates information on matters affecting professional practice. The Department has a complete set of press-cuttings together with that arriving from the profession, and this information, together with the help of members through the Editor and the Medical Secretary, enquiries by members, whether through Honorary Secretaries of Division or Branch or addressed to the head office, as to matters of doubt or difficulty affecting them in their professional capacity are welcomed. In an increased number of cases the Association has been able to give useful advice or help as regards the obtaining of satisfactory professional work. It is now also a part of its daily work to advise individual members on questions of post-graduation study, buying and selling of practices, as to homes and other institutions for patients, and in short, all matters of professional doubt or difficulty, including also legal advice in respect of matters which affect the general interests of the profession.

## RECRUITMENT OF NEWLY QUALIFIED PRACTITIONERS.

36. The Council is again glad to report good progress in connection with the scheme inaugurated two years ago for interesting final-year medical students and recently qualified practitioners in the work of the Association. The number of newly qualified members of the profession who are joining the Association is steadily increasing. Practically all the Divisions and Branches whose areas contain medical schools are doing excellent work to this end, especially by arranging social meetings of welcome to the newly qualified members of the profession.

## "Handbook for Recently Qualified Medical Practitioners."

37. A new edition of the "Handbook for Recently Qualified Medical Practitioners" is now in course of preparation, and the Council has noted in this connection following Minute 70 of the A.R.M., 1924 :—

That in any addition to, or new edition of, the "Handbook for Recently Qualified Medical Practitioners," it is important that instruction should be given as to the correct and effective way of ensuring the payment of fees for the giving of evidence in the civil law courts. This Handbook has met a real need. The new edition will be slightly enlarged so as to make it still more useful, and will, the Council proposes, include further information as regards the legal aspects of practice, careers open to members of the profession, starting practice, partnerships, etc.

## Prizes to Students for Essays.

38. The following was decided upon as the subject for the Association's 1924-5 Prize Essay competition by final-year medical students :—

"The Diagnosis and Treatment of Chronic Intestinal Obstruction," with illustrative cases.

The following members of the Association have kindly acted as Examiners in connection with the award of the Prizes: The Right Hon. Lord Dawson of Penn (London), Mr. W. F. Haslam (Birmingham), Dr. W. E. Hume (Newcastle-on-Tyne), Mr. H. Wade (Edinburgh). The Council will give the names of the prize winners in its Supplementary Report. The Council has decided that in future years the Prize Scheme shall be advertised in July instead of October, so as to give the essayists more time.

## LOCUM BUREAUX IN TEACHING CENTRES.

39. The Council has considered the following Minute 71 of the A.R.M., 1924 :—

That it be referred to the Council to consider the advisability of a Locum Bureau being formed, under the auspices of the Association, in each teaching centre. Up to quite lately, the question of the supply of locumtenents and assistants, in practically all the Provincial and Scottish centres, was not dealt with on any organised basis. The usual practice was for doctors to telephone to members of the teaching staff asking if they could recommend a locum; instrument makers and wholesale druggists carried on a certain amount of such work for the benefit of their customers; and often the

APRIL 11, 1925]

## Organization.

hospital hall porter acted as an agent. In London the case is different, there being many medical agencies, old and new.

40. In order to put matters on a better footing, definite action has been taken locally in the interests both of the general practitioners and of the newly qualified members of the profession in Manchester by the Local Medical Committee, in Newcastle-on-Tyne by the Newcastle Division, and in Scotland by a Scottish Medical Bureau at the Scottish Office of the Association independent of the Association but under a Committee which consists of "the members for the time being of the Scottish Committee of the B.M.A."

### Local "Appointments Committees."

41. The difficulties experienced by the newly qualified in obtaining posts have been recognised by a number of Universities, with the result that the Aberdeen, Cambridge, Edinburgh, Glasgow, Oxford and St. Andrews (and possibly other) Universities have set up "Appointments Committees" to assist the local graduates, medical and other, to get work.

### Question of Action by the Association as regards Institution of such Bureaux.

42. At a conference on this and allied subjects held in March 1924, of Secretaries of Divisions and Branches whose areas contain medical schools, many speakers emphasised the need that the Association should do something to assist the newly qualified members of the profession during the difficult period following graduation. In view of the increasing number of newly qualified who are joining the Association, this aspect of the subject is, the Council considers, deserving of special attention by the Association. An increasing amount of such work is already being done by the Association in one way or another, but the need is as yet far from being adequately met. Young medical men and women would be much more easily induced to join the Association, and more firmly attached to it, if it were able to help them more in this critical stage of their professional career.

43. The Council, on careful review of the whole position, has come to the conclusion that the time has arrived when the Association should itself take steps as regards the formation of bureaux, under the control of the Association as far as possible, in such centres as may seem desirable, for supply of locumtenents and assistants.

44. As regards the scope of these bureaux the Council considers that their activities might, in the initial stage at all events, be confined to the supply of locumtenents and assistants; (a) be possibly limited to Provincial and Scottish centres; and it has under consideration whether the organisation should only be for the fourth year after registration of practitioners up to the end of the fourth year after registration under the Medical Acts. It is obviously desirable, however, that any Company or Society formed for these purposes should have powers sufficiently wide to enable the bureaux, if so desired, to widen their scope at a later period. The Council therefore suggests that any such Company or Society should be formed with wide powers, and that a number of matters should be specifically reserved for further consideration by the Council.

45. As such a new organisation as is proposed to be set up would at the outset at all events, deal only with provision of locumtenents and assistants and would probably be subject to the other limitations above indicated, it would not come seriously into competition with existing ordinary agencies.

46. As it is practically certain that the bureaux of any such organisation would be made use of by practitioners who were not the other limitations above indicated, it would not come seriously into competition with existing ordinary agencies.

The Council recommends:

**Recommendation:** That a Bureau for the provision of locumtenents and assistants, with power for further expansion, be formed under the auspices of the Association, to operate in such centres as may be deemed desirable, and that the organisation be set up under the control of the Association by means of (a) a separate Limited Liability Company, or (b) a Society registered under the Friendly Societies Act, whichever may be found the more suitable.

**Recommendation:** That the questions (i.) of confining the activities of the Bureau to provincial centres; (ii.) of the Bureau subsequently taking over the work of transfer of practices; and (iii.) of limiting the activities of the Bureau to newly qualified practitioners up to the end of the 4th year after registration under the Medical Acts, be reserved for further consideration by the Council.

**Recommendation:** That in any such scheme instituted as above, preferential treatment be given to members of the British Medical Association.

## QUESTION OF INDIVIDUAL MEDICAL DEFENCE.

47. As a result of the discussion at the Bradford Representative Meeting, and of proposals since made on the subject, the Council has again considered the question of individual medical defence being undertaken in connection with the Association. It will be remembered that the Council reported on this subject to the A.R.M., 1923, at Portsmouth as follows:—

42. The Council has given careful consideration to the question of individual medical defence for members of the Association. As members know, the Association can and does intervene for the defence of members in cases where the general interests of the profession are affected, but cannot itself under its Memorandum of Association undertake individual medical defence in other cases. The Council came to the conclusion that in view of the recurring evidence of the great need that individual practitioners should be insured in respect of medical defence, the insurance of members of the Association in this respect should be furthered in every possible way, and that to this end use might well be made of the existing medical defence societies. The Council has gone fully into the whole matter, in consultation with the London and Counties Medical Protection Society, the Medical and Dental Defence Union of Scotland, and the Medical Defence Union.

43. As a result the Council has decided that the Association itself should take no action as regards individual medical defence, but wishes to draw the special attention of all concerned to the fact that, inasmuch as, however skilful and careful a member of the profession may be, he (or she) is liable to have his treatment challenged by or on behalf of a patient, every practitioner should make a point of joining one of the recognised medical defence societies named above.

48. The A.R.M., 1923 (Min. 60), considered the following amendment by Warrington and St. Helens:—

That (with reference to above paragraphs 92 and 93 of the Annual Report of Council) this meeting notes with satisfaction that the Council of the Association has given careful consideration to the question of Individual Medical Defence for members, but greatly regrets that the Council has not seen its way to recommend the alteration of the Articles of the Association so that this paramount duty may be undertaken either by the Association itself or by its incorporation with one or more of the existing Defence Societies; further, that this meeting is of opinion that the individual defence of members in professional matters should be one of the functions of the Association, and instructs the Council to prepare statistics of the work and costs of ensuring individual defence, and that these be laid before the Divisions in order that their opinion on this important matter may be obtained.

The amendment was lost, and the above report of the Council was approved.

49. The question was further raised at the A.R.M., 1924, when a proposal by Manchester, to the effect that the Council should be instructed to formulate a scheme for the medical defence of individual members of the Association, either by itself or in co-operation with existing bodies, was lost by 53 votes to 76.

### Present Position as regards Provision for Individual Medical Defence.

50. In cases where questions of principle affecting general professional interests are involved, the Association itself intervenes, but otherwise individual legal defence does not, under its Memorandum, come within the scope of the Association.

51. In Great Britain there are three organisations which enter for individual defence, namely, the London and Counties Medical Protection Society, Ltd., the Medical and Dental Defence Union of Scotland, Ltd., and the Medical Defence Union, Ltd. In each case the entrance fee is 10s. (none to practitioners joining within a year of registration), and the annual subscription of £1. The benefits in each case include an indemnity for the individual member against costs and damages where the case is defended or conducted by the company.

52. It would appear that, in the case of England and Wales, there are approximately some 7,000 practitioners doing medical work, many of them doubtless members of the Association, who are not members of either of the London individual defence societies, and presumably not members of any such organisation. In connection with the foregoing it has to be noted that the work of the profession, and the work of the Association in defence of the interests of the profession, for example, in connection with the National Health Insurance Acts, is bringing members of the profession, both collectively

and individually, more and more into contact with legal questions. Thus it looks as if there is to be, for the present at least, more need for the legal defence of the individual. This applies perhaps especially to newly-qualified members of the profession, who in the nature of the case lack experience and knowledge of medico-legal matters.

*Possible Nature of Provision for Individual Medical Defence in Connection with the Association.*

53. The Council has reviewed the possibilities as regards provision of individual defence facilities by or in connection with the Association, including the following possible alternatives:—

- (a) Full medical defence for all members;
- (b) Optional full medical defence;
- (c) Partial medical defence;
- (d) Extra medical defence expenses; and
- (e) Legal bureau for members.

Of these, if the Association were able, so to speak, to make a fresh start and begin its career under a fresh Memorandum of Association, Scheme (a), i.e., full medical defence for all members, might be the best plan. As matters stand it is not a business proposition, for (1) a considerable number of members do not require individual defence provision and would therefore decline to pay a subscription which would be partly ear-marked for payment of the expense of such a provision, (2) it is practically certain that, under its existing Memorandum, the Association would not be permitted itself to carry out individual medical defence, and (3) it is very improbable that the High Court would agree to a drastic alteration of the Memorandum of Association such as that which would be involved in adding to the present objects of the Association, viz., the maintenance of the honour and interests of the profession, a clause under which individual defence could be undertaken.

54. The Council is of opinion that the only possible workable scheme would be the alternative (b), namely, optional full medical defence for such members of the Association as chose to pay an extra subscription for it. Such a provision would be restricted to those members of the Association who desired it. Its organisation would necessarily be, though connected with, quite separate from the organisation of the Association. It could either be a separate company or a friendly society, probably the former.

55. As regards scope, such a provision would necessarily have to give, at a subscription not higher than that of existing medical defence societies, the same insurance as these do, namely, a practically unlimited cover against costs and damages. The Association could no doubt arrange for unofficial representation, by a majority of members, in the governing bodies of any such new company or society. Its constitution would require to provide for the method by which decisions would be arrived at as to which cases should be taken up, which fought in the courts, which otherwise settled, or which declined. No doubt co-ordination between the work of the Association and the work of the new body could be arranged. Geographically, the main scope of any such new body would doubtless require to be Great Britain and Ulster.

*Question of Probable Support for such a Scheme: Need for Further Information.*

56. The Council considers that it would be a very serious mistake to form any such organisation as above, unless there was a reasonable prospect of adequate support. The extent of the demand could probably best be ascertained by drafting a scheme and submitting it to the members in the United Kingdom, individually, with questions, including the specific question whether he or she would support such a scheme, if formed, by joining the new organisation. If the Representative Body approves this plan, the Council will prepare a draft scheme for the purpose of such a plebiscite. Issue of a draft scheme with questions would not commit the Association to proceed further in the matter, for, according to the nature of the response, it would be open to the Council to rule that formation of such an organisation would not be undertaken, inasmuch as the promises of support were insufficient, or to come to the conclusion that an association should be formed, on the ground that *(inter alia)* by the support were sufficient to justify its formation. A further question is whether such a scheme is adequate.

*Financial Aspect: Drafting a Scheme for Optional Full Medical Defence.*

57. Any such new organisation would require to provide a protection at least as full, at a subscription at least as high, as those given by or paid to the existing defence societies. Any draft scheme prepared as above would be on the basis of a practically unlimited cover, an annual subscription of

£1 and no entrance fee. Some 6,500 would probably be the minimum number of members of any such individual defence organisation required to enable it to be run successfully.

*Conclusions Arrived at by the Council.*

58. To sum up, the Council is of opinion:—

- (a) That the only form of medical defence which could possibly be afforded to members is full medical defence (as given by the existing societies) to such members of the Association as desired it and were willing to pay a separate subscription for it;
- (b) That it would be possible to give such full defence by initiating a separate organisation;
- (c) That such an organisation should not be launched unless a reasonable measure of support were forthcoming.

The Council recommends:—

**Recommendation:** That the Council be authorised to prepare a draft scheme on the basis of an annual subscription of £1, in order to ascertain the number of members who desire the initiation of such a scheme and would be prepared to join in its membership.

*RULES OF ORGANISATION.*

59. The Model Rules of Organisation were amended last year to provide representation, on Division Executive Committees and Branch Councils, of members of the Association employed whole-time in the public health service, and the Council is gratified to note that a considerable number of Divisions and Branches have adopted Rules to give effect to that important principle. A far greater number of Divisions and Branches are now in possession of up-to-date Rules of Organisation than has ever before been the case.

The Council will submit in its Supplementary Report a list of U.K. Divisions and Branches which are, according to the register at the Head Office, not yet in effective possession of any Rules of Organisation.

*AFFILIATION BETWEEN THE ASSOCIATION AND THE CANADIAN MEDICAL ASSOCIATION.*

60. The Bradford Representative Meeting, 1924, on receiving the report of the Delegates on the cordial welcome given by the Canadian Medical Association to the proposals for affiliation of the two bodies, instructed the Council to do its part to carry the proposals into effect. The Council has much pleasure in reporting that the proposals were also approved by the Annual Meeting of the Canadian Medical Association, held in 1924, and that during the past year the two bodies have been in close co-operation on a number of matters of mutual interest.

61. The affiliation proposals provided *inter alia* for (i.) an indication of the fact of affiliation on the official documents of both bodies; (ii.) interchange of official copies of the *British Medical Journal* and the *Journal of the Canadian Medical Association* and of other important publications of both bodies; (iii.) use by the Canadian Medical Association of the "Important Notices" in the *British Medical Journal*; (iv.) right of members of the Canadian Medical Association to attend Sections and functions of the Annual Meeting of the British Medical Association, and to have the use of the B.M.A. House and Library, and the help of the central staff of the Association, with in each case reciprocal advantages to members of the British Medical Association visiting Canada; (v.) interchange of official visits and of information between the two bodies; (vi.) for members of the Canadian Medical Association to receive the *British Medical Journal* at the £1 11s. 6d. subscription rate; and (vii.) discontinuance of Branches of the British Medical Association in Canada.

The Council has arranged accordingly, and as reciprocal arrangements have been made by the Canadian Medical Association, the affiliation between the two bodies is now an accomplished fact.

**Recommendation:** That affiliation of the Association with the Canadian Medical Association be approved on the conditions set out in foregoing paragraph, and more fully in the Report of the Delegates to the Canadian Medical Association (A.R.M. 22) presented to the Bradford Representative Meeting.

A further formal step remains, as below.

The Council recommends:—

**Recommendation:** That the Annual Representative Meeting, 1925, approve and adopt as Articles of Association, the following draft new or amended Articles relating to the affiliation of medical bodies outside the United Kingdom to the Association, and instruct the Council to submit those Articles to

Extraordinary General Meetings of the Association for adoption as Articles of the Association:

(a) *Draft New Article, to follow existing Article 36*

"AFFILIATION.

(1) The Association may admit to affiliation with it any medical Association or similar body established outside the United Kingdom on such terms and with such privileges as may in each case be approved by resolution of the Representative Body passed after consideration of a report by the Council.

(2) The Association may terminate any such affiliation (after due notice on either side) by resolution of the Representative Body passed after consideration of a like report.

(3) Any resolution of the Representative Body under this Article shall be final and shall not require to be approved under Article 34."

(b) *Draft Amended Article 34.*

Existing Article 34 to be amended by inserting after "Representative Body" in line 7—"except as otherwise expressed in the Regulations."

INCORPORATION OF QUEENSLAND BRANCH.

62. As a result of representations made by the Australian Federal Committee the Representative Body in 1921 approved a proposal that provision should be made in the Regulations of the Association to allow Oversea Branches to retain the character, status, rights, powers and duties of Branches, although incorporated, such steps to be, however, taken as might be necessary to protect the Association from liability for any act of the incorporated body. The Australian Federal Committee and some of the Australian Branches attach considerable importance to Branch incorporation, especially from the point of view of the holding of property. Pursuant to the above decision of the Representative Body, there were adopted by the Association in 1922 an Article (12) and By-laws (16 and 17), providing for such incorporation. Subsequently there was prepared by the Australian Federal Committee, and agreed upon with the Council, a model Memorandum and Articles of Association for the use of any Australian Branch which might wish to incorporate itself.

The Queensland Branch has submitted for the approval of the Council a draft Memorandum and Articles based on the above model. These have been approved, and the Council has expressed to the Branch its good wishes for progress under the new arrangement.

QUESTION OF ORGANISATION OF MEDICAL PROFESSION IN SOUTH AFRICA.

63. The Council reported fully last year (see B.M.J. Supplement, May 3rd, 1924, pp. 188-9), in connection with the question of the organisation of the profession in South Africa, and stated that, in order to assist the profession in South Africa to secure the services of an Organising Medical Secretary, it had informed the South African Committee that, on the assumption that such Secretary and necessary expenses would cost something in the neighbourhood of £2,000 per annum, it was prepared to grant a sum of £1,000 per annum for three years on condition that the members of the Association in South Africa supplied the balance and that a suitable Secretary could be found.

The South African Committee has conveyed its thanks to the parent Association for this offer, but has deferred further consideration of it for one year. Meanwhile, the Committee has convened a special meeting of the Presidents and Secretaries of Branches in the area, for the purpose of discussing questions of organisation. The Council has reason to believe that the situation in South Africa, from the point of view of the Association, is steadily improving.

STANDING COMMITTEES.

64. The Council believes that it would be to the great advantage of the Association if a larger number of members could be induced to take a share in the work of the Committees. The work is steadily on the increase, and it throws a heavy strain upon a comparatively small number of members. The Council has therefore amended its Standing Orders so as to provide that no member of the Association shall be appointed by the Council to serve on more than two Standing Committees (exclusive of the Arrangements, Irish, Scottish, Welsh and Insurance Acts Committees). The Standing Orders of the Representative Body already contain provision on these lines.

CONSTITUENCIES FOR ELECTION OF REPRESENTATIVE BODY, 1925-6.

(a) *Home Divisions.*

65. The Council has repeated the 1924-5 grouping of the Home Constituencies for election of the Representative Body,

1925-6, except that the Furness and Kendal Divisions of the North Lancashire and South Westmorland Branch have been made independent Constituencies.

(b) *Oversea Divisions.*

The Council has made each Oversea Division and Division-Branch an independent Constituency.

GROUPING OF BRANCHES FOR ELECTION OF COUNCIL (By-law 53 (a) and (c)).

(n) *Grouping for 1925-6:*

66. Under the authority conferred upon it by the Representative Body, the Council has grouped the Home Branches and the Home Constituencies, respectively, for election of the "24" and "12" members of Council for 1925-6, in the same way as for 1924-5, except that in the "12"—grouping, Chelsea Division has been transferred from the Outer to the Inner Metropolitan Group.

(h) *Grouping for 1926-7.*

67. For several years past, Wales has put forward a request for increased representation on the Council, but the difficulty has always been how to effect this without interfering with the grouping as a whole. The matter has been raised again recently, and the Council considers that the wish of the Welsh members is reasonable and should be satisfied. The grouping of the Home Branches for election of the Council has always, and advisedly, given effect to the principle of very considerable over-representation of those Branch areas which lie further from or of less easy access to London. At present (1924 Annual List), the respective countries are represented on the Council as follows:

	Membership.	No. of Members of Council.
Ireland ... ..	732	6
Scotland ... ..	2,685	6
Wales and Monmouthshire	1,045	2
		(1 is shared with Provinces)
Provinces ... ..	10,387	17
		(1 is shared with Wales)
London ... ..	3,353	6

The Council is of opinion that a seat on the Council may fairly, and without disturbing the grouping as a whole, be given to Wales at the expense of Ireland.

The existing groupings in respect of Wales and Ireland are as follows:

"24" Members of Council. "12" Members of Council.

	No. to be elected.	Members in Group.	Branches in Groups.	Members in Group.	No. to be elected.	
Group F	1	906	Birmingham (629) Staffordshire (277)			
" G	1	1045	North Wales (214) Shropshire and Mid Wales (126) South Wales and Monmouthshire (705)	1951	1	Large Group IV
" Q	1	74	Connaught (34) ... S. Eastern of Ireland (40) ...	274	11	" XI
" R	1	200	Leinster (200) ...			
" S	1	83	Munster (83) ...	458		" XII
" T	1	375	Ulster (375) ...			

As will be seen, the Council, in its recommendation below, proposes a re-arrangement of these groupings and proposes that the Branches in Ireland be re-grouped in the light of the position resulting from the formation of the Irish Free State.

The Council recommends:

**Recommendation:** That as regards the grouping for election of the Council for 1926-27, the following changes be made:

*A regards the "24"—Grouping.*

(a) That the North Wales, and Shropshire and Mid-Wales Branches be made a separate Group, for election of 1 Member of Council;

(b) That the South Wales and Monmouthshire Branch be similarly a separate group;

(c) That the independent grouping (see Group "S") of Munster Branch be discontinued, and that this Branch be added to the Connaught and South-Eastern of Ireland Branches in Group "Q."

*As regards the "12"—Grouping:*

(d) That the suggested two Welsh groups, together with the Birmingham and Staffordshire Branches, constitute (as at present) "Large Group IV.";

(e) That in view of the formation of the Irish Free State, the Connaught, South-Eastern of Ireland, Leinster and Munster Branches constitute "Large Group XI.", and that the Ulster Branch be independent as "Large Group XII."

**"British Medical Journal."**

68. During 1924 the growth in the circulation of the *British Medical Journal* continued; the average number of pages printed weekly increased; and the revenue from advertisements was the largest ever received. The growth in circulation is shown by the following figures, which give the average number of copies printed weekly during the six years since the War: 24,520 in 1919; 26,195 in 1920; 27,247 in 1921; 27,600 in 1922; 29,036 in 1923; and 31,339 in 1924. The total number of pages of text (including Supplement and Epitome) and of advertisements was 5,640 last year as compared with 5,512 in 1923, 5,204 in 1922, and 5,136 in 1921. The revenue from advertisements was £39,437 as compared with £38,818 in the previous year. In the last pre-war year (1913) the revenue from advertisements was £24,169, though the number of pages of advertisements at that time was much greater; thus the policy of increasing the rate of charges has been abundantly justified. The average total number of pages of the *British Medical Journal* each week in 1924 was 106.4, distributed as follows: Journal and Epitome, 49.3; Supplement, 10.5, advertisements, 46.4.

69. Publication of the scientific and clinical proceedings of the Annual Meeting at Bradford, including full reports of the twelve scientific Sections, occupied 256 pages; the reports of the Presidential Address, proceedings of the Annual Representative Meeting, the Annual General Meeting, and various conferences held at Bradford, occupied 65 pages; this making in all 322 pages. Publication of the full reports of the Sections was completed by the end of December. During the year the annual report of the Insurance Acts Committee, the various documents issued by that Committee, the report of the annual and special conferences of Local Medical and Panel Committees, and the evidence given on behalf of insurance practitioners before the Court of Inquiry into the capitation fee made several issues of the Supplement unusually large. A considerable amount of space in the Journal was again devoted to British Medical Association lectures and other papers read to the Divisions and Branches of the Association.

70. The Journal Committee continues to exercise strict supervision over advertisements tendered for publication in the *British Medical Journal*, and has found it necessary to exclude a considerable number, which for one reason or another did not conform to the policy and requirements of the Association. This supervision, as indicated in last year's report, necessarily entails a considerable loss of revenue, but it yields valuable results to the medical profession and, indirectly, the public. While the acceptance of an advertisement for publication in the *Journal* is not to be understood as recommending or guaranteeing the article advertised, yet the appearance of an advertisement indicates that no objection of principle has been taken to it. In many instances the task of discriminating between advertisements, and deciding which of them are admissible and which should be refused, is not easy. All new advertisements tendered for publication are scrutinised in the Medical Department of the Association, and those considered *prima facie* to be misleading or otherwise objectionable are referred for further inquiry and consultation. A detailed statement of advertisements suspended or refused, and of the grounds for the action taken, is presented to every meeting of the Journal Committee, when the circumstances of each case are reviewed. The Committee re-appointed the Foods and Drugs (Advertisements) Subcommittee which continues to advise its chairman in regard to doubtful advertisements of drugs and dietetic preparations. The claims made for particular substances have been reported on by pharmacological and analytical experts.

71. The question of extending and improving the *Epitome of Current Medical Literature* was considered by the Journal Committee, on whose recommendation the Council authorised the occasional enlargement of the *Epitome* to six or eight pages, according to the other demands on space in the particular week.

72. The gross cost of production and distribution of the *British Medical Journal*, including all editorial and a proportion of the managerial expenses, was £59,520 in 1924. Receipts from advertisements, sales to non-members, and a

few small items, amounted to £49,024; so that the net cost of the *Journal* to members of the Association was £11,496, or 8s. 1d. a head for the whole year including postage. Thus while the gross cost of producing a single copy of the *Journal* and supplying it to a member was 8d., the net cost to him was approximately 2d.; to a non-member in Great Britain or Ireland the price of a single copy of the *Journal*, including postage, was 1s. 4½d. The sale of *Journals* to non-members yielded £7,325. The charge for postage of the *Journal* to members continues to form a very heavy item of the total expenditure on the *Journal*. It amounted to £10,635 as against £9,724 in 1923; £8,904 in 1922; and £7,261 in 1921. The increase in postage costs is due mainly to the continued growth in membership, and partly to the growth in size and weight of the *Journals* posted.

**Science.****SCIENTIFIC WORK OF ANNUAL MEETING, 1925.**

73. The Council has decided upon the following Sections for the forthcoming Annual Meeting at Bath. *Three-day Sections:* Medicine; Surgery; Obstetrics and Gynaecology; Pathology and Bacteriology; Neurology and Psychological Medicine; Therapeutics including Balneology and Radiotherapy. *Two-day Sections:* Ophthalmology; Laryngology, Otology and Rhinology; Diseases of Children; Public Medicine; Orthopaedics (one day being combined with Surgery). *Single-day Section:* Medical Sociology.

**THE ASSOCIATION'S SCHOLARS AND GRANTEES.**

74. The Council has again allocated a sum of approximately £1,000 out of the ordinary funds of the Association for the purpose of assisting original research. The following are the awards made for 1924-5:

**Ernest Hart Memorial Scholarship—(Value £200).  
Research.**

Dr. Alexander John Copeland (Cambridge) (Second year)	Completion of the present research— "Value and importance of the Cocaine Substitutes, with special reference to the anaesthesia of the eye and mucous membranes"
---	---

**Ordinary Research Scholarships—(Three, each of the value of £150).  
Research.**

Dr. H. W. Cairns (London) (Second year)	Tuberculosis of the Epididymis and Testicle; the paths of infection, the progress of infection, and the results of methods of treatment.
Miss Alice Bloomfield, F.R.C.S. (London)	The bearing of Embryological detail on Pathological conditions occurring in the Female Genito-Urinary Tract, with especial reference to the causation of Ectopic Gestation.
Mr. Norman McOmish Dott, F.R.C.S. (Edinburgh)	(1) Investigation into the physiological functions of the Pituitary Glands. Observations of general Syndromes of experimental derangements, including observations on bone growth, Polyuria, Adiposity. Enquiry into other endocrine functions. (2) The Secretory and Motor Functions and relations of the Stomach, Pylorus, and Duodenum. (3) The study of, and experimental relief of, Hydrocephalus.

**Research Grants (Total Value £390).**

75. Mr. H. Bailey and Mr. G. P. B. Huddy (London) £50; Prof. J. M. Beattie (Liverpool) £20; Dr. Dorothy C. Hare (London) £30; Dr. O. Inchley (Cambridge) £10; Dr. Mary F. L. Keene (London) £50; Dr. A. P. Mitchell (Edinburgh) £20; Dr. E. P. Poulton (London) £20; Mr. F. C. Pybus (Newcastle-upon-Tyne) £50; Dr. J. M. D. Scott (Cambridge) £120; Prof. M. J. Stewart (Leeds) £20.

**Work of the Scholars and Grantees.**

76. The reports received in respect of the Association's Scholarships and Research Grants are frequently more suitable for publication in the various technical Journals than in the *British Medical Journal*. With the assistance, however, of those gentlemen who have kindly undertaken to review the work of the various Scholars and Grantees, a condensed report of this work will be published in the *Journal*. The Council proposes to arrange, should opportunity arise, that the holder of a B.M.A. Scholarship or Scientific Grant shall be recommended to the Officers of the appropriate Section at the Annual Meeting as a reader of a paper or the opener of a discussion at that Section.

## B.M.A. LECTURES.

77. The Council has set apart a sum of £400 for 1925 for the provision of B.M.A. Lectures and these continue to be most successful. The Council has decided also that the further sum of £50, together with any money left over from the above £400, be placed at the discretion of the Science Committee with a view to meet in part the expenses of any representative of the Association who may be visiting the Dominions and who may be willing to deliver one or more B.M.A. Lectures there.

78. The following have given Lectures during the past year: Dr. W. A. Brend (3 Lectures), Dr. H. C. Cameron, Mr. W. F. H. Coko, Mr. W. McAdam Eccles, Dr. Geoffrey Evans, Dr. J. S. Fairbairn, Sir Henry Gauvain, Prof. A. J. Hall, Col. L. W. Harrison (2 Lectures), Dr. C. M. Hinds Howell, Mr. H. H. Joy, K.C., Dr. W. Langdon Brown, Dr. A. Leitch (2 Lectures), Mr. S. Gordon Luker, Prof. T. J. Maekie, Prof. A. W. Mackintosh, Lt.-Col. R. McCarrison, Prof. Hugh Maclean, Dr. B. E. Myers, Mr. R. P. Rowlands, Mr. H. S. Souttar (2 Lectures), Sir James Purves-Stewart, Mr. P. Jenner Verrall, Mr. H. Wado, Prof. D. P. D. Wilkie, Dr. S. A. Kinier Wilson (2 Lectures), Dr. R. A. Young.

## MIDDLEMORE PRIZE.

79. The Council proposes to award at the Annual Meeting at Bath the Middlemore Prize to the person who is adjudged to have submitted to the Association the best contribution on any Ophthalmological subject, whether previously published or not, provided that the contribution shall not have been published or prepared more than three years prior to the date on which applications are receivable in competition for the Prize. Mr. G. Mackay, F.R.C.S., Edinburgh, Mr. W. T. H. Spicer, F.R.C.S., London, and Dr. A. L. Whitehead, Leeds, have kindly consented to act as Judges in the competition, and the Council will announce the result in its Supplementary Report.

## RESOLUTION OF OPHTHALMOLOGICAL SECTION.

80. The Council on consideration of the following Minute 73 of the A.R.M., 1924:—

That the Council be asked to reconsider its decision in respect of the following para. 76 of the Annual Report of the Council:

*Resolution of Ophthalmological Section.*

76. The Section of Ophthalmology at the Portsmouth Meeting recommended the Council to press strongly upon the Government the great need for research upon many unsolved problems of vision in relation to the requirements of the combatant services. The Council, on consideration of the matter, does not feel that this question is one concerning which it could usefully take action,

decided to forward the resolution to the Admiralty, the War Office, the Air Ministry, the Committee of the Privy Council for Scientific and Industrial Research, and the Medical Research Council. The Council has received replies from each (except the Admiralty) to the effect that the matters raised are under consideration.

## WORCESTERSHIRE MEDICAL SOCIETY'S LIBRARY.

81. The Worcestershire Medical Society, which was formed about 1860, and which has recently ceased its activities, has offered to the Association the books in its Library, many of which were presented to the Society by the late Sir Charles Hastings, the founder of the British Medical Association.

The Council has accepted, on behalf of the Association, the kind offer of the Worcestershire Medical Society and hopes, in view of the special interest attaching to the gift, that it may be possible to house the Hastings' books in a special section of the Library of the Association.

## THE LIBRARY.

82. The Council is gratified to note the rapidly increasing use which is being made of the Association's Library. Since 1922 there has been an increase of nearly 100 per cent. in the number of books sent out on loan, and the Council is making further provision of the expansion of the Lending Library facilities.

The Honorary Librarian, Mr. W. G. Spencer, continues to give the Council much valuable assistance in connection with all matters affecting the Library, and his work during the present transition period has been specially arduous.

## THE "SIR CHARLES HASTINGS CLINICAL PRIZE."

83. The Council reported to the A.R.M. 1924, that it had established a special Prize for the purpose of stimulating systematic observation, research and record in general practice, and the suggestion was made at the Bradford Representative Meeting

(Min. 75) that in the event of more than one essay of merit being sent in the Council should award more than one Prize. The Council has approved of this suggestion and effect will be given to it in considering the merits of the several contributions. The Council is glad to note, from the number of enquiries which it has received on the subject, that its proposal to award a Prize of this character has aroused considerable interest.

## Medical Ethics.

## INDIRECT METHODS OF ADVERTISING.

84. The Annual Representative Meeting at Bradford expressed general approval of the Report of the Central Ethical Committee on Indirect Methods of Advertising, but instructed the Council to reconsider the following paragraphs 12 and 13 of the report (dealing with anonymity in the Press) so as to make more clear the occasions when, and the conditions under which, anonymity might be departed from:

"12. From time to time there are discussed in the papers matters of great public interest or importance regarding which it is to the advantage of the public that the medical considerations involved should be stated either by letter, article or interview. If the only object in view is the proper instruction of the public, it is not necessary that the names of the medical writers or informants should be given. The newspapers can give the necessary assurance to their readers as to the professional standing of the authority quoted without mentioning names. If the journalist were dissatisfied with this course it would probably be due to a desire to satisfy the curiosity of his readers about personalities rather than to a desire to instruct them on important matters. But even from the journalist's point of view adherence to the practice suggested would give him better results, since it would place at his disposal the opinions of men of greater standing and experience than are available now when names are allowed to be bandied about in public. There may be rare exceptions to this rule of anonymity, as when a doctor is himself a principal actor in the circumstances under review. His intervention may be necessary, and would be meaningless if anonymous. In this case the publicity given has already been necessary on public grounds.

"13. Speaking generally, it may be said that the medical men most often quoted in the Press are not those whose opinions carry most weight with the medical profession or with the educated public. It is natural that those whom the Press representatives most eagerly seek to draw into their service and utilise for their own advantage are those who have some recognised position or well-sounding address or title. It is, therefore, especially important that a stand should be made by such practitioners, who perhaps do not realise that the example set by them may well be pleaded in justification by those in a less prominent position."

In the light of the discussion at the Bradford meeting, the Council has drafted a new paragraph 12, which it suggests should be substituted for the original paragraphs 12 and 13. The Council further proposes that the Report be now approved as a whole in its revised form.

**Recommendation:** That the A.R.M., 1925, approve the revised Report of the Central Ethical Committee on Indirect Methods of Advertising (see Appendix II.).

## PROPRIETY OF SETTING UP IN PRACTICE IN AREA AFTER HAVING ACTED AS LOCUM TENENS.

85. The Council is frequently asked to advise on questions relating to the propriety of a doctor setting up in practice in an area where he has acted as locum tenens, and is of opinion that the matter is one upon which a ruling should be laid down by the Association in order that enquiries may be dealt with expeditiously. The Council has endeavoured to formulate a general rule, but it recognises that no rule can be expected to cover all possible circumstances, and it is therefore suggested that, in order to provide for a necessary degree of elasticity, pleas for the relaxation of the Rule should be dealt with by the Central Ethical Committee in the light of the facts of the individual case.

The Council recommends:

**Recommendation:** That the R.B. express the opinion:—

That as a locum tenens is introduced in confidence to the practice of which he takes charge, it must be presumed on principles of common equity that he cannot without dishonour commence practice in the neighbourhood where he has acted unless with a written consent obtained either from the practitioner whose substitute he has been or from the legal representatives of this practitioner. There may, however, be circumstances, for example the lapse of time, which would make the strict application of this Rule an unreasonable interference with the freedom of a practitioner who had acted as a locum tenens. If any such plea for the

relaxation of the Rule in any individual case can be advanced, the facts should be stated to the Central Ethical Committee and the judgment of the Central Ethical Committee on the point should be accepted as final.

#### ETHICAL RULES.

'86. In pursuance of the standing instruction of the Representative Body the Council reports that the following bodies in Great Britain have still not adopted the revised Ethical Rules :

*Divisions :* Argyllshire, Chester, Crewe, Dover and Folkestone, Dumbartonshire, Durham, Edinburgh and Leith, Halifax, Hendon, Islands, Leigh, Ross and Cromarty, Salford, Shetland, South-West Essex, Tower Hamlets, Wandsworth, Winchester.

*Branches :* East York and North Lincoln, Edinburgh.

#### NOTICES REGARDING APPOINTMENTS.

87. The Council has considered the following Minutes 147-8 of the A.R.M., 1924 :

That the Council be instructed to take into consideration the present procedure adopted by Headquarters in dealing with cases arising under the heading of "Important Notices," as regards conformity by the Division reporting the case with the Ethical Rules of the Association, and with a view, if possible, to speeding up the procedure.

That the following motion be referred to the Council for consideration :—That in all cases of Appointments under the Public Health Service to which objection is taken on account of the remuneration offered being insufficient, a binding resolution should be adopted by the Division or Branch concerned previous to the appointment being made.

88. The Council approved, in 1923, the principle of Divisions and Branches adopting binding resolutions under their Ethical Rules in respect of the scale of minimum commencing salaries for Public Health Medical Officers as a whole, but action in respect of this matter was deferred pending final settlement of the scale. Now, however, that the scale has been finally revised, the Council intends to take action at the earliest opportunity on the lines stated above, and this will have the effect of meeting the points raised in the foregoing Minutes 147-8 of the A.R.M.

89. Since the adoption by the Portsmouth Representative Meeting of the new scale of salaries, the greater number of Notices regarding appointments in the *Journal* have had relation to public health appointments, and the Council is gratified to note in this connection that most Divisions and Branches are prepared voluntarily to adopt resolutions under their Ethical Rules in order to promote adherence to the rates of salary laid down in the scale. Cases occur, however, where Divisions are either unwilling or unable to take action on these lines, and this has sometimes given rise to an anomalous position which, it has been suggested, might be avoided if the Association were able to deal with the matter centrally instead of through the Division concerned. Having regard to the facts (i.) that the Association has deliberately chosen a constitution which gives Divisions complete autonomy, and (ii.) that the great majority of the Divisions and Branches loyally follow the lead given by the Representative Body, the Council does not suggest that any change should be made in the existing situation.

#### QUESTION OF PRACTISING IN A LOCALITY AFTER NEGOTIATIONS FOR PURCHASE.

90. The question has been raised with the Council as to the desirability of formulating a rule to deal with situations where a practitioner, having entered into negotiation for the purchase of a practice in a particular locality, subsequently, on the failure of the negotiations, commences practice in that locality.

The Council has expressed the opinion that a medical practitioner who, on information he has received, forms the opinion that he may reasonably expect to make a practice in a given district is quite at liberty to act upon this opinion, provided that such information has not been obtained by enquiries addressed to a practitioner (or to his authorised agent) who is in practice in the district and who desires to sell either the whole or a part of his practice or to establish a partnership. Once such enquiries have been made the enquirer, in the event of negotiations failing, ought not to commence practice in the district without the written consent of the other party to the negotiations; and the principle here stated applies equally to vacancies created by death as it does to those resulting from the voluntary action of the vending practitioner. The adoption of this rule, however, involves the supposition that the vending practitioner (or his agent) has dealt fairly and reasonably with the purchasing practitioner, and has not arbitrarily and without adequate reason broken off negotiations.

#### NURSING HOMES.

91. The Council has expressed the opinion that if a medical practitioner has a financial interest, involving his possible pecuniary gain, in any institution to which he refers a patient, it is desirable that he should disclose this fact to his patient.

#### ANNOUNCEMENT OF SPECIALTIES ON DOOR-PLATES.

92. The question of the announcement of specialties on the door-plates of medical practitioners is a matter which the Council has raised with the General Medical Council. The Association has always maintained the position that it is undesirable that practitioners who confine themselves to certain special departments of medical practice should announce on their door-plates the specialties in which they practice. This opinion would not extend to the designation "Dental Surgeon" on door-plates, as this is information to which it is reasonable that the public should have access and is equivalent to the use of the term "Physician" and "Surgeon" to which there is no objection. But so far as the medical or surgical specialist is concerned the usual and proper procedure is that the patient goes to the specialist on the recommendation of his ordinary medical attendant and therefore there is no need for any announcement of the specialty on the door-plate.

The General Medical Council was asked to support the Association in the attitude which the Association adopted in this matter, and has informed the Council that, although it would be unlikely to find proved a charge of unprofessional advertising in a particular case, it would deprecate any extension of the custom of announcing special departments of practice on the part of medical practitioners.

#### Medico-Political.

##### FEES PAID TO MEDICAL PRACTITIONERS BY SEAMEN'S NATIONAL INSURANCE SOCIETY.

93. This matter has again been under consideration by the Council. The fees paid by this Society, largely on account of representations made by the Association, were increased step by step until on 1st July, 1922, they stood 40 per cent. above the basic rates. On 1st January, 1924, however, they were reduced to 25 per cent. above the basic rates.

Difficulty has arisen particularly in Southampton, where the reduced scale of the Society is below the usual contract fees of the district. The President and the Secretary of the Society met the Contract Practice Sub-Committee of the Association when it was made clear to the former that in the opinion of the Association their fees were too low. The officials of the Society stated that on account of peculiar difficulties in collecting the contributions of their members they were not able to pay more, though they would be willing to do so if these difficulties could be overcome. They were willing to pay a fee per visit with medicine of 3s. 6d. and of 2s. for attendance at the surgery together with a 25 per cent. increase in the rest of their basic scale if they could get the Ministry of Health to approve the arrangement. The matter of the difficulty with the contributions has been raised with the Ministry of Health both by the Society and by the Association.

#### DANGEROUS DRUGS REGULATIONS :

##### (A) Preparations containing Opium, Morphine, etc.

94. In reply to an enquiry from the Home Office asking whether the medical profession would be likely to object strongly if the Dangerous Drugs Regulations were made to apply to all preparations containing opium, morphine, etc., no matter how small a proportion of the drug, the Council considered that as such a provision would include every cough mixture and many other preparations in common use it could not agree to such a restriction, and informed the Home Office accordingly.

##### (B) Committee re supply of Morphine and Heroin to Drug Addicts.

95. In July, 1924, the Minister of Health informed the Association that he had received from the Home Secretary a copy of a letter stating that the Council of the League of Nations had instructed its Secretary-General to ask the various Governments for their views as to the advisability of the total suppression of the manufacture of heroin or of its limitation to the minimum amount required. The Minister asked the Association to state whether in its view it would be desirable (a) that the manufacture of heroin should be prohibited, or (b) that the quantity made available should be limited to the quantity required for legitimate purposes.

96. The Minister was informed that as this drug had a legitimate use in medicine, the Association could not agree that its manufacture should be prohibited, but there would be no objection to such limitation of the manufacture or supply of the drug as would not interfere with its legitimate use either now or in the future.

97. In August, 1921, the Association was invited to nominate a member to serve upon a Committee (Chairman, Sir Humphry Rolleston), appointed by the Minister of Health, the reference of which was as follows:

"To consider and advise as to the circumstances, if any, in which the supply of morphine and heroin (including preparations containing morphine and heroin) to persons suffering from addiction to those drugs may be regarded as medically advisable, and as to the precautions which it is desirable that medical practitioners administering or prescribing morphine or heroin should adopt for the avoidance of abuse, and to suggest any administrative measures that seem expedient for securing observance of such precautions."

The Council nominated Dr. J. W. Bone, of Luton, who was appointed to the Committee.

#### METHYLATED SPIRIT.

98. As instructed in the following resolution of the A.R.M., 1924:—

*Minute 184.*—Resolved: That it be referred to the Council to consider the alteration in the composition of methylated spirit by the addition of pyridine, which renders the spirit unfit for use as an external application to the skin and unpleasant to burn on account of the disagreeable odour produced; and to take such steps as are possible to get the use of pyridine discontinued if the spirit is supplied to the order of a medical practitioner,

the Council has approached the Chancellor of the Exchequer, the Treasury, the Inland Revenue and the Board of Customs and Excise, and has been informed (i.) that the Commissioners of Customs and Excise are in consultation with other departments concerned with regard to draft comprehensive Regulations which have been prepared on the subject of industrial and mineralised methylated spirits; and (ii.) that in the meantime the Commissioners have given facilities to many chemists to obtain industrial methylated spirit for preparing "surgical spirit" by the addition of suitable denaturants, which will render the preparation incapable of being used wholly or partially as a beverage or internally as a medicine, and that in such cases the formula used has to be submitted to, and approved by, the Commissioners. The Council is keeping in touch with the Board in this matter, which appears to be anxious to do all it can to meet the difficulties of the profession.

#### USE OF OPIUM BY MIDWIVES.

99. Pursuant to the following resolution of the A.R.M., 1924:

*Minute 28.*—Resolved: That (with reference to paras. 89 and 90 of the Annual Report of Council) this meeting is of opinion that the protest against the use of opium by midwives should be renewed,

representations, for the third year in succession, have been made to the Ministry of Health and the Central Midwives Board protesting against midwives being allowed to use opium. The position, however, remains unaltered, both authorities having definitely declined to recede from their previous attitude on this question.

#### CORONERS' LAW AND DEATH CERTIFICATION.

100. In the Annual Report for 1923-4 (para. 120) the Council reported that a Special Sub-Committee had been set up for the purpose of considering the question of the amendment of Coroners' and Death Certification law with a view to amending, if thought fit, the 1905 policy of the Association on these matters. This Sub-Committee has now completed its reference and a Memorandum has been drawn up which the Council recommends for adoption as the policy of the Association in substitution for the 1905 policy.

101. The Council has decided to draft a Parliamentary Bill based on the Memorandum and to get the Bill introduced into Parliament at the earliest possible date. It is known that the Government has prepared, and proposes shortly to introduce, a Bill dealing with Coroners' Law. That Bill will be watched with a view to amendments being put forward if any provision therein is found to conflict with the policy of the Association.

The Council recommends:

**Recommendation:** That the Memorandum on Coroners' Law and Death Certification (see Appendix III.) be adopted as the policy of the Association in substitution for the existing policy of the Association on these matters.

#### SUPPLEMENTARY DEATH CERTIFICATES.

102. The Council is in entire agreement with the policy enunciated in the following resolution of the A.R.M., 1924:—

*Minute 35.*—Resolved: That the following motion be referred to the Council for consideration: That (with

reference to para. 120 of the Annual Report of Council) it is desirable to give supplementary death certificates only at the request of the patient's representatives or after their consent had been obtained,

and recommends:

**Recommendation:** That the R.B. is of opinion that additional death certificates should not be given except at the request of the patient's representatives or after their consent has been obtained.

#### COMPOSITION OF GENERAL MEDICAL COUNCIL.

103. Consideration of the proposed addition to the membership of the General Medical Council has been undertaken by the Council in connection with the following resolution of the A.R.M., 1924:—

*Minute 185.*—Resolved: (i.) That this Representative Body considers that the time has arrived when the Medical Acts should be reconsidered with a view to the General Medical Council having a larger direct representation of registered medical practitioners; and (ii.) that it be an instruction to the Council to take all possible steps with a view to bringing this into effect.

104. The composition of the G.M.C. at the present time is as follows:—(i.) Five persons nominated by His Majesty on the advice of his Privy Council (three for England, one for Scotland, and one for Ireland); (ii.) twenty-seven representatives of Universities and Examining Bodies (fourteen for England and Wales, seven for Scotland, and six for Ireland); and (iii.) six Direct Representatives (four for England and Wales and one each for Scotland and Ireland).

105. So far back as 1906 the Association favoured the policy that at least half the members of the General Medical Council should be directly elected by the general body of medical and dental practitioners in the country, and in 1910 a Bill was drafted aiming at the radical amendment of all previous Medical Acts, and providing *inter alia* (i.) that the Direct Representatives should form a majority of the whole Council; (ii.) that there should be one portal for medical qualification; and (iii.) that no unregistered person should be allowed to practise medicine. It has never been found possible to further this policy.

106. If the G.M.C. were a body whose business it was to protect the interests of the medical profession it would probably not be difficult to convince the public and Parliament that the balance of its present composition is wrong, but the purposes for which the Council was instituted are:—

(i.) To keep a register showing those who are properly qualified to practise; (ii.) to impose educational standards on the bodies conferring medical qualifications; (iii.) to discipline the profession, in the interests of the public; and (iv.) to prepare and publish the British Pharmacopoeia.

107. Any attempt seriously to change the character of the G.M.C. from that of a body largely composed of men engaged in teaching and therefore having expert knowledge of the main work of the Council to one of a democratic and representative nature, in which the opinion of the rank and file of the profession could be expressed, would give rise to opposition in several quarters—first, the majority of the present G.M.C., who, presumably, are fairly well satisfied with the body as it is; secondly, the Privy Council, which regards the G.M.C. as its agent in carrying out the objects enumerated above; and, thirdly, the public as represented by Parliament. From time to time incidents occur which show that the present powers of the G.M.C. are regarded very jealously by considerable sections of the public. Any attempt to increase considerably the number of direct representatives would be regarded as an attempt by the profession to get more control of the Council for its own purposes. Those people who have hitherto refrained from assailing the Council or trying to diminish its powers and privileges would no longer be restrained if action were taken which claimed, or seemed to claim, that the Council should be in any way a body for the protection of the interests of the profession. Moreover, if it were decided to ask for a considerable increase in the number of representatives, which could only be secured by an Act of Parliament, the whole position of the G.M.C. would be in the melting pot and it is quite likely that determined efforts would be made to weaken its present powers and privileges. It is doubtful whether the profession on the whole would like to take this risk.

108. If all that is wished is an additional Direct Representative, on the ground that there has been an increase in the constituency, it should be noted that if in 1911 it was regarded as being fair that there should be four Direct Representatives for 25,500 constituents, i.e. one for a little over 6,000, it is not easy to maintain the position that there now ought to be five for 28,500.

109. The Council after very carefully considering the position is of opinion that so far as increasing the efficiency of the G.M.C. is concerned it cannot see that the addition of another Direct Representative, or indeed of any number likely to be accepted without a revolution in the composition of that Body, would be likely to affect the position. The present Direct Representatives have no difficulty in obtaining a hearing on any matter in which the general interests of the profession are involved.

The Council therefore recommends:—

**Recommendation:** That having fully considered the position with regard to the present constitution and the duties and powers of the General Medical Council, the R.B. does not consider that the Association should take steps (as suggested in Min. 185 of the A.R.M., 1924) with the view of obtaining a larger number of Direct Representatives of registered medical practitioners on the General Medical Council.

#### EXAMINATION OF APPLICANTS FOR ENTRANCE INTO FRIENDLY SOCIETIES, APPROVED SOCIETIES AND PUBLIC MEDICAL SERVICES.

110. The A.R.M., 1924 (Mins. 47-8), expressed the opinion that there was no objection to Friendly Societies or similar organisations which required entrance medical examinations insisting upon having these examinations carried out by an appointed doctor or doctors, except in the case of (a) admission of insured persons as such to Approved Societies, or (b) eligibility for membership of Public Medical Services, and left it to the Council to consider whether a minimum fee should be fixed centrally or locally. The Council has decided that it is better that such a minimum fee should be determined locally.

#### MEDICAL CERTIFICATES ON RESUMPTION OF UNEMPLOYMENT BENEFIT.

III. Pursuant to the following resolution of the A.R.M., 1924:

*Minute 57.*—Resolved: That the Council inform the Ministry of Labour that the present practice of Labour Bureaus requesting certificates of fitness of health from individuals re-applying for Unemployment Benefit after illness is unnecessary, and a cause of annoyance to the medical attendants of these individuals; and further, that the Council urge the Ministry of Labour to instruct Labour Bureaus to discontinue the practice,

a letter was sent to the Ministry of Labour (a) objecting to the practice of Labour Exchanges requesting certificates of fitness of health from individuals re-applying for Unemployment Benefit, and (b) urging that the Exchanges should be requested to discontinue the practice.

The Minister of Labour stated that such steps as were possible would be taken to avoid this practice, and that a general instruction to this effect would be issued to Labour Exchanges. Two specific cases have since been reported to the Ministry and have been dealt with by them.

#### INCOME TAX AND SUBSCRIPTION TO THE ASSOCIATION.

112. The Council has to report that, under a ruling given by the Commissioners of Inland Revenue, medical practitioners whose incomes are assessed under Schedule D are entitled to a rebate for Income Tax purposes in respect of their subscription to the British Medical Association, but that practitioners whose incomes are assessed under Schedule E are only entitled to such a rebate if membership of the Association is an essential condition of the terms of employment.

#### FEES TO CIVILIAN MEDICAL PRACTITIONERS FOR ATTENDANCE ON SOLDIERS ON FURLOUGH.

113. In consequence of representations made to the War Office the fee paid in respect of a consultation at a doctor's surgery by a soldier on furlough has been increased from 2s. to 2s. 6d.

#### FEES FOR MEDICAL EXAMINATION OF RECRUITS: REGULAR ARMY AND R.A.F.

114. Following on representations made by the Association, the fee for medical examination of recruits for the Regular Army and for the R.A.F. has been increased from 2s. 6d. to 3s. per recruit examined, subject to a maximum of 27s. 6d. a day.

#### FEES FOR EXAMINATION OF RECRUITS FOR TERRITORIAL ARMY.

115. Steps are being taken to get the fee for examination of recruits for the Territorial Army raised to 2s. All Territorial Army Associations have been approached with

this object in view, but the majority say they cannot pay the fee unless they get a bigger grant from the War Office. The War Office is being asked to increase the grant.

#### CERTIFICATES UNDER CREMATION ACT.

116. In October, 1922, the Council decided that the fee for filling in either of the three certificates under the Cremation Act, 1902, should be one or two guineas, according to the ability of the relatives to pay. It was learned subsequently that the London Cremation Co., in issuing the confirmatory medical certificate (Form C), affixed thereto a notice stating that where the remains of the deceased were within the London District, this Certificate, if desired, would be arranged for at a fee not exceeding One guinea.

As a result of representations the Company has discontinued the use of this slip.

#### ELECTION OF DIRECT REPRESENTATIVES ON G.M.C., 1925-29.

117. The Council is gratified to report that the four nominees selected by the Meeting of the Representatives for England and Wales on 21st July, 1924, namely, Drs. Brackenbury, Bolam, and Macdonald, and Sir Jenner Verrall, were returned at the top of the poll by a greatly increased majority as compared with the last election. The number of those who exercised their right to vote is still small considering the time and energy expended by the central organisation in bringing this duty to the notice of the profession. The percentage of those voting in 1924 was 55 per cent. as against 43.14 per cent. in 1919.

#### NURSING HOMES (REGISTRATION) BILL, 1925.

118. The Council has been asked to support the College of Nursing Bill for the Registration of Nursing Homes, and has decided to do so subject to certain conditions. The Council is of opinion that adequate control is already exercised over medical practitioners who receive into their homes resident patients, but subject to this reservation and to the Bill being approved by the Parliamentary Sub-Committee of the Medico-Political Committee, the Council has promised the support of the Association.

#### PAYMENT FOR HEALTH CERTIFICATES FOR ELEMENTARY SCHOOL CHILDREN.

119. The following resolution of the A.R.M., 1920:—

*Minute 156.*—Resolved: That where an Elementary School Authority requires a medical certificate of the inability of a child to attend school, the fee for such certificate shall be paid by the Education Authority,

is not in accord with an opinion given by the Solicitor to the Association in 1905 wherein he stated that the onus of proof of a child's unfitness to attend school rested upon the child's parents; and there is a good deal of evidence to the effect that in those areas where the practitioners have acted in accordance with the Minute quoted above difficulties have arisen. In some areas Education Authorities have resorted to sending the children to their clinics to get the certificates which the private doctors will not give.

The Council considers that it is unwise for the Association to take up a position which cannot be enforced legally, and it therefore recommends:—

**Recommendation:** That, inasmuch as Minute 156 of the A.R.M., 1920, does not accord with the opinion of the Solicitor to the Association as to the legal position with respect to medical certificates of unfitness of school children to attend school, that Minute be rescinded.

#### FEES FOR MEDICAL EXAMINATION OF EMIGRANTS.

120. In 1923 (Min. 136) the A.R.M. approved an agreement which the Council had arrived at with the Directors of Migration of the Dominions of the Empire and which provided that the following fees should be paid for medical examination of intending emigrants:—

10s. 6d. per adult of the age of 16 years and over;  
2s. 6d. for each child, but in no case more than two children in a family to be charged for.

This wording has proved to be ambiguous, as some emigration agents have held that the provision "but in no case more than two children to be charged for" applies to all children in a family whether over or under 16 years of age. This, of course, was not intended, and the chief M.O. of the Commonwealth of Australia when the position was reported to him suggested the form of words embodied in the following recommendation, which the Council has accepted, with slight verbal modifications.

The Council therefore recommends:—

**Recommendation:** That the fees chargeable by the Medical Referees appointed by the Dominions of the Empiro to examine proposed emigrants should be as follows:—

10s. 6d. for an applicant of 16 years of age or over.  
2s. 6d. for each applicant under 16 years, provided their parents or guardian are sailing with them.

Not more than two applicants under 16 years of age in one family to be charged for.

Applicants under 16 years proceeding alone will be charged 10s. 6d.

In substitution for the fees adopted in Minute 136 of the A.R.M., 1923.

#### MINISTRY OF PENSIONS MEDICAL OFFICERS.

121. The contracts of the M.O.s. to the Ministry of Pensions expired on the 31st March, 1925, and the Ministry decided to establish 48 of these M.O.s.—each to be ex-Service—and to engage the remainder on contracts for periods ranging from three years to six months.

Of the 48 to be established the Ministry decided that 38 should be on the permanent scale of £600-900 as Deputy Commissioners of Medical Services; 8 on a permanent scale of £900-1,000 as Commissioners of Medical Services, Inspectors and Chief Assistants to Directors; and 2 at £1,200 fixed, for employment at Headquarters; pensions to be at the ordinary Civil Service rates.

122. Arising out of consideration of representations by the Ministry of Pensions Medical Association the Council made representations to the Ministry to the following effect:—(a) That the number of M.O.s. in the £600-900 group should be reduced and that a middle group at £800-1,000 should be formed; (b) that the offer to the M.O.s. who were not to be established was inadequate; and (c) that it was unreasonable not to give the two Directors any prospect of advancement. The Minister was also asked to receive a deputation on the whole subject or to submit to arbitration the case of the M.O.s. not chosen for establishment. The Minister (i.) declined both the latter proposals, but granted a small monetary increase to the unestablished M.O.s.; and (ii.) stated that he did not see his way to make the alteration suggested with regard to the £600-900 group.

123. On the advice of the Association the M.O.s. accepted the scheme as a whole, though with considerable reluctance, feeling that they had not been treated as they believed they had a right to expect. The Council hopes to arrange for the Minister of Pensions to be asked in the House why he declined to go to arbitration seeing that the Ministry of Health on a much larger financial issue, and one affecting many more practitioners, has accepted this principle on two occasions.

#### PART-TIME PRISON M.O.s.

124. For many years it has been a regulation that part-time Prison M.O.s. should see all prisoners as soon as possible after their admission to prison. This regulation was, however, not rigidly enforced until after the War, and the M.O.s., of whom there are 23, applied to the Association to bring their case before the Prison Commissioners, chiefly with a view to extra remuneration for the compulsory evening visits.

After full consideration of the position the Council made representations to the Prison Commissioners asking *inter alia* for an addition of £100 per annum to the salary of each part-time Prison M.O. in respect of the compulsory evening visit or visits. The Medical and Assistant Medical Secretaries at an interview with the Chairman of the Prison Commissioners were informed that the Prison Commissioners could not urge the Treasury to grant the general increase of the salary, but would be prepared to give sympathetic consideration to individual cases where it could be shown that the number of evening visits was great. The officers concerned are being advised to send in their claims.

#### FEES FOR MEDICAL PRACTITIONERS CALLED IN ON THE ADVICE OF MIDWIVES.

125. For some time the Council has endeavoured to get the Ministry of Health to rule that a medical practitioner who is called in on the advice of a midwife shall receive the fee prescribed by the official scale for such attendance, whether or not the midwife has acted irregularly in summoning the practitioner, provided the official form is used.

The representations of the Council have now been given effect to in that the Ministry of Health has altered the note which is printed on the back of the official form to read as follows:—

"The medical practitioner responding to a call in the case of any emergency as defined in the Rules framed under

Section three 1 (e) of the Midwives Act 1902 (see Rule E. 20) will be paid his fee by the Local Supervising Authority for his attendance on this case in accordance with the scale prescribed by the Ministry of Health." (Note: The words in italics are additional to the original note.)

This alteration came into effect on 1st January 1925, and the necessary consequential revision has been made in the Rules of the Central Midwives Board.

#### PATENT MEDICINES.

126. The Council is glad to report that there is an increased interest on the part of the public in the question of the advertising of patent medicines, as evidence of which at a Meeting held on 17th November, 1924, after a debate on the subject in which the Medical Secretary took part, the Publicity Club of London (a) recorded its opinion that the present condition of the law in regard to patent medicine advertising called for immediate reform and (b) urged the introduction of legislation along the lines of the recommendation of the Select Committee of the House of Commons in 1914.

This resolution was forwarded by the Club to every member of the House of Commons who was interested in advertising or the press. Arrangements are being made in co-operation if possible with other interested parties, to press on the Government the desirability of the early introduction into Parliament of the Bill which went through the House of Lords in 1920 and to a very great extent carried out the recommendations of the Select Committee of the House of Commons which reported in 1914.

#### FACTORY MEDICAL SERVICE.

127. On 21st March, 1924, the Secretary of State for Home Affairs appointed a Departmental Committee with the following reference:—

To enquire into the working of the provisions of the Factory and Workshop Acts for the medical examination of young persons as to their fitness for employment in factories, and to consider:—

(A) Whether the existing requirement of a certificate of fitness limited to a particular factory should be modified; whether any other changes should be made in the examination and certificate; and what arrangements should be adopted for the future;

(B) What measures should be taken for linking up the examination of young persons under the Factory and Workshop Acts with their examination under the school medical inspection service, and, if considered desirable, with other public health services of the country;

(C) What arrangements could best be made for providing medical supervision of young persons (where such supervision is considered necessary by the Department) during employment in factories or processes where the conditions of work are unfavourable to health or physique,

and asked the Association to suggest a suitable medical practitioner to serve on this Committee. The Council put forward the name of Dr. Wallace Henry, and he was appointed to the Committee. Following on its report the Labour Government introduced a Bill to consolidate and amend the existing Factory Acts. This Bill entailed a radical revision of the provisions for the examination and certification of young persons in regard to their fitness for employment in factories and certain classes of workshops. It was, however, dropped when that Government went out of office in October, 1924. The Council, however, had in the meantime been considering the position and had drawn up certain principles which it considered should form the basis of the policy of the Association in regard to a Factory Medical Service. These principles are as follows:

(i.) That there should be a distinct Department of Occupational Hygiene attached to the Ministry of Health which should include the present Factory Medical Service transferred from the Home Office.

(ii.) That if any changes are made the interests of existing members of the Factory Medical Service should be carefully conserved or compensated.

(iii.) That as a general rule any practitioner hereafter appointed to perform the duties at present performed by Factory Surgeons, or duties analogous thereto, should at the time of appointment be in general practice or have had recent experience of general practice.

(iv.) That opportunity should be given to Local Authorities for submitting schemes for transferring the administration of the work of Occupational Hygiene to the Local Authorities (in so far as it is not already under their administration) and

that if the voluntary trial made by Local Authorities proves successful the transfer of the whole of this work to Local Authorities should be ultimately effected by order of the Departments concerned.

(v.) That whilst of the opinion set out in the preceding paragraph, the Council considers it desirable that any Factories Bill introduced into Parliament should make provision for the setting up of a complete service of Occupational Hygiene.

(vi.) That any Factories Bill should provide for due retention of the powers already possessed by Local Sanitary Authorities in respect of Factories and Workshops.

(vii.) That so far as practicable all supervision of sanitation in factories, workshops and workplaces, as defined in the Factories Act of 1901, should not only be retained by the Local Sanitary Authority, but should be extended to all factories.

(viii.) That any Factories Bill introduced should provide that the Regulations and Orders of the Secretary of State having reference to sanitation in factories shall apply, local By-laws and Regulations notwithstanding, and should be enforceable by the Local Authorities and not by the Factory Department except in cases of default.

128. At the A.R.M., 1924, the following motion was referred to the Council for consideration :—

*Minute 37.*—Proposed by Dr. W. Adam Burns (Glasgow Eastern): That (with reference to para. 273 of Supplementary Report of Council) the Special Sub-Committee appointed to draw up a draft policy of the Association with regard to the provisions of the Factory Acts should contain one Scottish Member who is conversant with the matters involved.

This has been given effect to by the appointment of Dr. David McKail of Glasgow as a member of the Special Sub-Committee which has been appointed to draw up a draft policy of the Association on the general question of the Factory Medical Service, to which Sub-Committee the principles enunciated above have been referred.

**Recommendation:** That the principles set out in para. 127 above as regards a Factory Medical Service be adopted.

#### CENTRAL EMERGENCY FUND.

129. This Fund, formed in 1905, was created and is supported voluntarily with the object of assisting members of the profession in maintaining the interests of the profession against organised bodies of the community, and on many occasions grants from this Fund have been of great assistance in this direction. The Fund is used for purposes to which the funds of the Association may not be applied, and is administered by the members, for the time being, of the Medico-Political and Parliamentary Committee, who act as trustees. A copy of the regulations of the Fund may be obtained from the Medical Secretary, and subscriptions and donations should be sent to the Financial Secretary of the Association. The Council strongly recommends this Fund to the favourable notice of members.

#### CAPITATION FEE OF M.O.s. OF GAS LIGHT AND COKE CO.

130. For the third time within recent years the Association has been able to render assistance to these Medical Officers in maintaining their standard of remuneration.

#### LUNACY LAW AND ADMINISTRATION.

131. It was reported to the Council on 23rd July, 1924, that a Royal Commission had been appointed with the following reference:—

(1) To enquire as regards England and Wales into the existing law and administrative machinery in connection with the certification, detention and care of persons who are, or are alleged to be, of unsound mind.

(2) To consider as regards England and Wales the extent to which provision is or should be made for the treatment without certification of persons suffering from mental disorder;

and to make recommendations.

132. The Council thereupon appointed a Special Committee to consider the question of the alteration of the Lunacy Laws, to prepare evidence for submission on behalf of the Association to the Commission, and to appoint witnesses to give that evidence before the Commission.

The personnel of the Special Committee was as follows:—

The Officers of the Association (*ex-officio*), Dr. R. Langdon-Down (Chairman of the Committee), Dr. G. F. Lusham, Dr. J. W. Bone, Dr. F. H. Edwards, Dr.

Bernard Hart, Dr. C. O. Hawthorne, Dr. J. A. Macdonald, LL.D., Mr. E. W. G. Masterman, Dr. Christine Murrell, Sir Alfred Nee-Oxley, C.B.E., Dr. A. F. Tredgold, Mr. E. B. Turner, and Sir Jenner Verrall, LL.D.

The following resolution of the A.R.M., 1924, was also referred to the Special Committee:—

*Minute 51.*—Resolved (unanimously): That the provision of a certificate under the Lunacy Acts by a qualified medical practitioner should be an act having the legal status of testimony given by a witness in a court of law, and should not render the practitioner liable either to any civil action or to any criminal charge, except in so far as the certificate may be shown to contain statements of essential importance which are proved to be inaccurate and to have been made with a wilful and deliberate intention to deceive.

133. In preparing the Memorandum of Evidence for submission on behalf of the Association to the Commission the Special Committee considered a number of memoranda and reports, the Mental Treatment (M.L.) Bill and the Lunacy Acts of 1890 and 1891. The Committee also, through the medium of the B.M.J., asked members of the profession to send in memoranda dealing with the questions under review. Several of these were sent in and received careful and critical consideration. The Royal Commission specially invited the Association to give evidence, and the dates for receiving this evidence were fixed by the Commission for 14th January, 1925, and 11th March, 1925, thus precluding the Memorandum of Evidence (*see B.M.J. Supplement*, 17th January, 1925, Doc. A.R.M. 2 (a)) is presented herewith to the Representative Body for ratification. Reports of the oral evidence given by the Association's witnesses before the Royal Commission will be found in the B.M.J. Supplement of 17th January, 1925, and 21st March, 1925.

The preparation of this evidence was a very responsible and laborious business, and the Council has on behalf of the Association expressed its great appreciation of the work of Dr. Langdon-Down and his colleagues.

#### PUERPERAL MORBIDITY AND MORTALITY.

134. Arising out of the Report by Dame Janet Campbell on "The State of Health—Reports of the Ministry of Health, 1923"—the Council has appointed a Special Committee to consider and report on the causation of puerperal morbidity and mortality and on the administrative action, if any, that should be taken by the Association in connection therewith. The Council has also referred to this Committee the Report of the Special Committee of the section of Obstetrics and Gynaecology of the Royal Society of Medicine which has been received through the Ministry of Health with a request for the opinion of the Association.

#### MINISTRY OF HEALING.

135. In June, 1924, the Council appointed a Committee "to consider and report in what manner, if any, the B.M.A., as representative of the medical profession, could prove of the greatest assistance in the further elucidation of the subject of the Ministry of Healing."

On 9th July, 1924, a deputation from the Committee was received by the Archbishop of Canterbury and the Bishop of Oxford to discuss the matter.

When the Report of the preliminary investigations of the Committee was considered, the Council, on the 23rd July, 1924, decided not to re-appoint the Committee on the ground that it was believed that the difficulties with which the matter was surrounded were likely to lead the investigation outside the sphere of the recognised activities of the Association.

#### Parliamentary Elections.

136. In connection with the General Election, October, 1924, the Trustees of the Medical Representation in Parliament Fund (the members for the time being of the Council of the Association) considered applications for approval of candidature and financial assistance from Dr. F. G. Bushnell, Labour candidate for the University of London, Mr. Somerville Hastings, Labour candidate for Reading, and Dr. E. J. Luce, K.C.M.G., C.B., Unionist candidate for Derby, a member of Council, also asked for approval of his candidature. The Trustees found it possible to approve, on behalf of the Association, and with due regard to the Objects of the Trust, the candidature of Dr. Spero and Sir Richard Luce,

a grant from the Fund also being made to the former. Sir Richard Luce was elected to Parliament, but Dr. Spero was unsuccessful.

The Trustees while unable to see their way to grant any financial assistance to Dr. Bushnell or to approve his candidature in view of the fact that there were two other medical candidates for the same constituency, were prepared to approve Mr. Somerville Hastings' candidature and grant him financial assistance out of the Fund if he had been able to give general consent to the policy of the Association as regards hospitals and a whole-time salaried State Medical Service, but this he was unable to do.

137. Letters were written on behalf of the Council to Sir Henry Craik (Unionist candidate for the Scottish Universities), Capt. W. E. Elliot, M.C. (Unionist candidate for Kelvingrove, Glasgow), Lieut.-Col. F. E. Fremantle (Unionist candidate for St. Albans), wishing them success and thanking them for all they had done in previous Parliaments to further the interests of the profession. Lieut.-Col. Fremantle asked that a letter should be sent to each of his medical constituents and this was done, and at the request of Sir Henry Craik a paragraph was inserted in the *Journal* recommending support of his candidature to all his medical constituents. The Council is glad to report that all three candidatures were successful.

138. The Representative Body which urged the institution of this Fund will be interested to know that the total number of subscribers from its inception in 1918 is 828. The Financial Statement will be published in the *B.M.J. Supplement*, April 18th, 1925.

### National Health Insurance.

#### ROYAL COMMISSION INTO WORKING OF NATIONAL HEALTH INSURANCE SYSTEM.

139. In 1923, the then Minister of Health (Sir William Jowson-Hicks) in the letter to the Insurance Acts Committee conveying his revised offer in connection with the 1924 capitation fee, stated that an impartial Royal Commission would be appointed "to investigate and report upon the whole system established under the National Health Insurance Acts, including medical benefit and the remuneration of the practitioner," and promised that the terms of reference of the Commission would be agreed with the profession. The Insurance Acts Committee was duly consulted as to the following terms of reference of the Commission:—

"To enquire into the scheme of National Health Insurance established by the National Health Insurance Acts, 1911-22, and to report what, if any, alterations, extensions or developments should be made in regard to the scope of that scheme and the administrative, financial, and medical arrangements set up under it."

and, as a result of consideration thereof, caused the following letter to be addressed to the Ministry of Health on March 21st, 1924:—

"I laid your letter of the 19th inst. before the Insurance Acts Committee at its meeting yesterday, and I was instructed to say that the Committee considers the proposed reference to the Royal Commission to be comprehensive and satisfactory. I am, however, instructed to remind you of paragraph 2 in the formula of the Minister of Health contained in your letter to me of October 31st, 1923. In this paragraph the Minister declared that 'an impartial Royal Commission will be appointed.' We attach a great deal of importance to this question of impartiality, and we should strongly object to a large Commission composed of representatives of the different interests involved. Our idea of an impartial Commission is one the members of which are not committed by their pecuniary or other interests to the present or indeed any particular form of administration of the National Health Insurance scheme. The members of such Commission should be people who approach the question with an open mind and, if it is possible to obtain such persons, with no pre-conceptions either for or against the system."

140. The personnel of the Commission was announced on July 7th, 1924, as follows:—Lord Lawrence of Kingsgate (Chairman), The Rt. Hon. Sir John Anderson, G.C.B., Sir Humphry Rolleston, Bart., K.C.B., Sir Alfred Watson, K.C.B., Sir Arthur Worley, C.B.E., Sir Andrew Duncan, Mr. A. D. Besant, F.I.A., Mr. Fred Bramley, Professor Alexander Gray, Miss Gertrude Tuokwell, Mrs. Harrison Bell, Mr. James Cook, Mr. John Evans and Mr. William Jones.

141. As soon as the terms of reference to the Commission were decided upon the Insurance Acts Committee considered

the lines upon which the profession's case should be prepared and the best means of preparing it. The possibility of extensions of the present Medical Benefit, either in the shape of (1) the additional services, or (2) the inclusion of further sections of the community, and the consequent likelihood of a wider section of the profession becoming thereby directly interested in the matter, raised the question as to whether it was desirable that the Committee, composed as it is of a large majority of insurance practitioners, should undertake the entire preparation and presentation of the profession's case. The Committee had no doubt that its reference was sufficiently wide to enable it to do this, but decided to recommend the Council to appoint a Special Committee to enquire into the extensions of the scope of the N.H.I. system, such a Committee being composed of representatives of all sections of the profession and consisting of a personnel which would impress the Royal Commission and the public as being thoroughly representative of medical opinion. The Council adopted this recommendation, and the result was the appointment of a Special Committee which, in conjunction with the Insurance Acts Committee, prepared a report which after revision by the Council was printed in the *B.M.J. Supplement* of January 3rd, 1925 (Doc. D. 11 and 12), extra copies being issued to non-members and Honorary Secretaries of Divisions and Local Medical and Panel Committees. The Secretaries were requested to arrange joint meetings of the whole of the local profession for the purpose of considering the draft evidence and to forward the views of such meetings thereon. In order to facilitate consideration of the draft evidence by the local meetings of the profession the Council issued questions upon the more important aspects of the evidence. At the same time Honorary Secretaries were informed (i.) that the views of such local meetings would be considered by a joint meeting of the Royal Commission and Insurance Acts Committees on February 5th and by the Council at a special meeting on February 18th, when the draft Memorandum of Evidence would be revised in accordance therewith, (ii.) that the revised evidence would be issued to Divisions and Local Medical and Panel Committees immediately after the Council Meeting on February 18th, in order that it might be considered at further meetings of the local profession when representatives could be instructed thereon, in anticipation of a Conference of Members of the Representative Body of the Association and of the Conference of Representatives of Local Medical and Panel Committees to be called for March 12th, 1925.

142. The Council when it discussed the question of the preparation of evidence gave very careful consideration to the method to be adopted in considering the evidence to be placed before the Royal Commission. The object desired was, of course, to bring into the discussion on the Draft Evidence the views of every school of thought and variety of practice in medicine in order to ensure that when the evidence was placed before the Royal Commission it should represent, so far as possible, the considered opinion of the whole profession. The Council therefore adopted the plan of joint meetings throughout the country under the auspices of the Divisions and of the Local Medical and Panel Committees, followed up by the Joint Conference of representatives of those bodies. It was suggested that a Special Representative Meeting should be held after the Conference in order to confirm the conclusions arrived at by that body and to make those conclusions formally into Decisions of the Association. The suggestion was rejected by the Council as not being in accordance with the plan deliberately adopted from the beginning, and as being likely to cause dissatisfaction on the part of those members of the Joint Conference who are not members of the Representative Body if, in doing their work, they were made to feel that it was to be reviewed by another body. Without derogation from the position of the Representative Body as the body which is responsible for the formulation of the policy of the Association, the Council believed that the evidence should go forward on the responsibility of the Council as the expression of the opinion of the general body of the profession, and that it was unwise and unnecessary to risk the complication of the position which would arise if some parts of the evidence were, and other parts were not technically "the policy of the Association."

143. The views of some 200 meetings of the local profession held in January, 1925, upon the Draft Evidence and the questions submitted with respect to matters dealt with in the Memorandum were considered at a Joint Meeting of the Insurance Acts and Royal Commission Committees on February 5th, and by the Council on February 18th, 1925. The views of the local meetings showed a large measure of general agreement with the draft Memorandum of Evidence, and the amendments which the Council made after considering the views of the meetings were therefore designed mainly to clear up misunderstandings on some points and to give

emphasis to others. The revised draft Memorandum of Evidence was published in the *B.M.J.* Supplement of February 28th, 1925 (D. 16), and Divisions and Local Medical and Panel Committee Secretaries were asked to place it before further meetings of the whole of the local profession at which the representatives of the Conference, to be held on March 12th, could be given any instructions which it was thought fit should be given.

144. The revised Memorandum of Evidence was before the Conference of the members of the Representative Body of the Association and of the Conference of Representatives of Local Medical and Panel Committee held in the Wesleyan Central Hall, London, on March 12th, 1925. A remarkable amount of agreement with the Draft Evidence was shown, some small amendments were made and several suggestions were made which have been considered by the Council. The evidence as amended will now be submitted to the Royal Commission after Easter and circulated to members of the Representative Body with the Agenda of the A.R.M. at Bath. The Council has appointed as its witnesses: the Chairman of Council (Dr. R. A. Bolam), the Chairman of the Representative Body (Dr. H. B. Brackebury), Dr. H. G. Dain (Chairman of the Insurance Acts Committee), and the Medical Secretary (Dr. Alfred Cox), with full power to call in other members to give evidence on any special points.

145. The Council having had an opportunity of considering a circular letter issued by the National Council for Combating Venereal Diseases to its Branches as to the evidence to be given by that body before the Royal Commission, has expressed the opinion that the Association maintains the principle that the treatment of any disease as such should not be removed from the province of general practitioners as a class, and that syphilis and gonorrhoea do not call for special modification of this principle.

#### CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES.

146. The usual Annual Conference of Representatives of Local Medical and Panel Committees was held on October 16th, 1924, under the Chairmanship of Dr. H. G. Dain, of Birmingham, and was well attended. The proceedings of the Conference were fully reported in the *B.M.J.* Supplement, October 25th, 1924. Dr. E. K. Le Fleming, of Wimborne, Dorset, was elected Chairman of the Conference for the ensuing session in place of Dr. Dain who has held the position for the last five years.

#### CONTRIBUTIONS TO THE FUNDS OF THE ASSOCIATION FROM THE FUNDS OF THE NATIONAL INSURANCE DEFENCE TRUST.

147. The National Insurance Defence Trust has again defrayed the cost incurred in connection with (i.) the election of direct Representatives upon the Insurance Acts Committee, and (ii.) the October, 1924, Panel Conference, amounting in all to some £200.

#### OPHTHALMIC BENEFIT.

148. The Council appointed a Special Committee to consider matters specially affecting ophthalmic surgeons and their relation to the public. The chief subject for consideration at the present time is the method of treatment of errors of refraction in insured persons. Some Approved Societies give as an additional benefit what is styled "Optical" Benefit, under which it is the custom of most Societies to refer such of their members as require spectacles to opticians. Representations have been made to the Ministry of Health, jointly with the Council of British Ophthalmologists, urging that in approving schemes for the so-called optical benefit steps should be taken to protect the interests of the patients by ensuring that their eyes are tested by properly qualified practitioners. In this matter the Insurance Acts Committee and the Ophthalmological Committee of the Association co-operated.

149. The reasons given by Approved Societies for the employment of opticians are (1) that they cannot afford to pay the fees for the advice of ophthalmologists, and (2) that the number of these is too small and their distribution throughout the country too uneven to allow of their employment even if the provision of the fee were practicable.

150. The Council has accordingly formed a list of some 500 ophthalmologists throughout the country who are prepared to see insured persons at a uniform fee of £1 ls. on behalf of Approved Societies, and the list of places where ophthalmic surgeons are willing to accept a reduced fee has been forwarded to the Ministry of Health. Some twenty Approved Societies which are either now, have, at their request, been furnished with a copy of the list in the hope that they may be induced to provide for their members expert advice. The general question of the administration of all

additional benefits, with special reference to ophthalmic benefit, is dealt with in the evidence to be given before the Royal Commission on National Health Insurance. The best way in which to deal with the immediate question, which is arising in connection with the recent National Health Insurance valuation, is being discussed with the Ministry of Health.

#### Non Panel.

151. The Council again appointed a Non-Panel Committee, the principal business of which was to draw up suggestions as to the evidence it considered should be given by the Association before the Royal Commission on National Health Insurance. The Committee held two meetings and three meetings of a special Sub-Committee, and the resulting suggestions were considered by the Joint Meeting of the Insurance Acts and Royal Commission Committees when the draft Memorandum of Evidence for submission to the Royal Commission was under consideration.

#### Public Health and Poor Law.

##### MILK AND DAIRIES ACT, 1915, AND TUBERCULOSIS ORDER, 1914.

152. The following Resolution of the A.R.M., 1924 has been considered:—

*Minute 160.*—Resolved: That while appreciating the reasons for paragraph 156 of the Annual Report of Council, this Annual Representative Meeting recommends that the Association press upon the public and the Government that the prevention of the sale of milk infected with tubercle bacilli is an urgent national necessity.

The position is that the operation of Sections 3 and 4 of the Milk and Dairies (Consolidation) Act, 1915, would give Local Authorities all the powers necessary for tracing the sources of tuberculous milk and for dealing with the situation, but the 1922 Act has suspended these powers until 1st September, 1925. The Council has therefore made representations to the Ministry of Health that the operation of the Act should be put into operation at the earliest date. In the House of Commons on 5th March, 1925, the Parliamentary Secretary of the Ministry of Health stated that it was not proposed to ask Parliament to postpone further the operation of the 1915 Act, which would therefore come into operation on 1st September, 1925.

##### VACCINATION ORDER, DATED 22ND AUGUST, 1924.

153. In the Annual Report of 1923-24 (paragraph 161) the Council reported that the form of declaration of conscientious objection to vaccination had been removed from the certificate of vaccination, and that people desiring the declaration had to make special application for it. This met the representations which had been made by the Association. The Council regrets to have to report that in August, 1924, the Minister of Health issued an Order, which came into effect on 1st October, 1924, and which restored the old position. The Minister of Health was informed that it was considered that the step was a retrograde one and very much to be deplored.

##### FACTS ABOUT SMALLPOX AND VACCINATION.

154. The Association's pamphlet "Facts about Smallpox and Vaccination" has been brought up to date by Dr. J. C. McVail and has been reprinted and put on sale at 6d. (post free in the U.K. 7d.).

##### PUBLIC HEALTH APPOINTMENTS.

155. The assistance of the Association has been sought in connection with a very large number of Public Health appointments during the session, and the action taken has, in a majority of the cases, led to successful results. The Council desires to place on record its thanks to those Honorary Secretaries of Divisions and Branches who have done the local work in connection with these cases, sometimes at the cost of very considerable labour. They have the satisfaction of knowing that in addition to improving the financial position of many members of the public health section of the profession their action has greatly increased the power and prestige of the Association and its ability to help other sections of the profession.

##### POOR LAW APPOINTMENTS.

156. A considerable number of Poor Law cases has also been dealt with, in most cases with success.

157. Certain appointments under the West Ham Board of Guardians raised an entirely new point, namely, the right of an employing authority to insist on its officers becoming members of a Trade Union. The West Ham Board of Guardians, which has a strong labour complexion, informed all its existing officers that it was the desire of the Board that each officer should

become a member of a Trade Union affiliated to the Trade Union Congress, and it also decided that in future advertisements it should be intimated that the successful candidate would be required as a condition of appointment to become a member of such a Trade Union. (The same position also arose in connection with Public Health appointments under the West Ham County Borough). As a result of a strong protest from the Association the Board of Guardians amended its Regulation in this respect by recognising as coming within the spirit and meaning of that Regulation those trade or vocational societies not affiliated to the Trades Union Congress with which it was possible for the Board to negotiate on all matters pertaining to staff, and under this section the B.M.A. is recognised as the societies which the Guardians desired their staff to

#### CONGRESS OF ROYAL SANITARY INSTITUTE.

The 36th Congress and Exhibition of the Royal Sanitary Institute will be held in Edinburgh 20th-25th July, 1925. Those members of the Council and Public Health Committee who are going to the Congress will be asked to represent the Association.

#### SUMMER TIME.

In 1923 the A.R.M. passed the following resolution:—

*Minute 104.*—Resolved: That the British Medical Association regrets that "Summer Time" has been curtailed this year, as it is of opinion that "Summer Time" is beneficial to the health of the nation.

Since then the Association has from time to time taken with a view to making "Summer Time" a permanent institution, both by sending representatives to meetings in London and by approaching Members of Parliament on the subject.

Recently the Early Closing Association, the pioneer organisation in this matter, and with which the Association has in active co-operation, informed the Association that the Early Closing Bill for a six months' period would be introduced in the House of Commons on 13th March, 1925. Accordingly a letter was sent to Division Secretaries asking them to urge the members of Parliament for their area to support the Bill, and representatives of the Association took part in a deputation to the Secretary on March 10th at which he promised Government support for the Bill. This obtained its second reading by a majority on March 13th.

#### SCALE OF SALARIES FOR PUBLIC HEALTH APPOINTMENTS.

The A.R.M. in 1923 passed the following resolution:—

*Minute 43.*—Resolved: That the Council be instructed to meet in consultation with representatives of the Associations representing the Local Authorities and be authorised, if necessary, to make such alterations in detail as may be necessary to secure an agreed scale.

Since that date the Council has, through a Conference composed of representatives of the Association, the Society of M.O.H.s, the Medical Women's Federation, taken action, under the authority contained in the above quoted Minute, and conversations have been held under the auspices of the Ministry of Health with representatives of the Association of Municipal Corporations, County Councils Association, Association of Education Committees, Urban District Councils Association, Rural District Councils Association, and the Metropolitan Boroughs Standing Joint Committee. These have resulted in certain modifications of the existing scale, which in its new form has received the approval of the Ministry of Health and was circulated by the Ministry on 4th July, 1924, to Local Authorities asking them to give it careful consideration.

62. The attitude of the Associations representing Local Authorities towards this scale is as follows:

(a) The Association of Municipal Corporations has decided to report to its constituents, the Municipal Authorities, that it considers that the modified scale of salaries is not unreasonable as a guide in making appointments; (b) the County Councils Association has decided against accepting any scale of salaries; (c) it is not known what attitude the Association of Education Committees has adopted. It is probable that the attitude will be unfavourable, though it must be governed to a considerable extent by that of the Municipal Corporations; (d) the Metropolitan Boroughs Standing Joint Committee did not consider it necessary to enter into any agreement in the matter because the Metropolitan Boroughs are already paying rates on the whole equal to or more advantageous than those stated in the modified scale.

163. A considerable number of Urban District Councils passed resolutions asking the Minister to call a conference of such authorities and representatives of the B.M.A. This the

Minister did not see his way to do. Under the auspices of the Ministry a few representatives of the Association of Rural District Councils met representatives of the B.M.A. and Society of M.O.H.s. on February 25th, 1925. The R.D.C. representatives made a strong plea for special consideration, but it was stated on behalf of the profession that it was impossible to make distinctions between whole-time M.O.H.s. doing the same work simply on the ground that they were employed by different classes of authorities. It is believed that some impression was made on the representatives of the R.D. Councils, but it is considered unlikely that their Association will formally approve the scale.

164. The Council has now adopted the modified scale of salaries as approved by the Ministry of Health and this scale will be issued by the Council to all Public Health Authorities, accompanied by a covering letter (a) dealing in a general way with certain important points which are not dealt with in the scale, and (b) intimating that the modified scale has received the support of the Ministry of Health and has been discussed over a long period with representatives of the Associations representing the various authorities employing medical officers, one of which at any rate, viz., the Association of Municipal Corporations, agrees that the scale is not unreasonable, the scale has now been finally adopted by the B.M.A., with the agreement of the Society of M.O.H. and the Medical Women's Federation, and it is hoped to have the help of the Health Authorities throughout the country in operating it.

The Council therefore recommends:

**Recommendation:** That the scale of minimum commencing salaries for whole-time Chief Medical Officers of Health and Medical Officers of Health of other grades, as agreed by the R.B., 1923, amended in 1924, and as modified in accordance with the instruction given in Minute 43 of the A.R.M., 1923, be approved. (See Appendix IV.)

#### SALARIES FOR COMBINED POSTS.

165. The Council has also considered questions dealing with the salaries of Medical Officers of Health employed by Joint Committees, and an explanatory note on this matter was published in the B.M.J. Supplement of 7th March, 1925. A copy has also been forwarded to the Ministry of Health for its information.

166. The representatives of the Association of Rural District Councils, with whom these proposals were discussed on 25th February, 1925, were of opinion that the suggestions may be helpful.

The Council recommends:—

**Recommendation:** That the following principles be adopted as applying to whole-time Medical Officers:—

(a) That where two or more districts combine to appoint a M.O.H. to serve under a Joint Committee, such M.O.H. being permitted to accept part-time duties (e.g., as T.O., S.M.O., etc.), under the County Council, the combined remuneration should be not less than the minimum commencing salary of a whole-time M.O.H., as indicated by the population of the combined areas; and

(b) that where an Assistant M.O. under a County Council is allowed to become a District M.O.H. for a definite proportion of his time (e.g., one half-day per week) such Assistant M.O. should receive remuneration at the rate of £80 per annum for each half-day per week allocated for his duties as District M.O.H., and that his salary as Assistant M.O. under the County Council should be reduced by 1/11th for each half-day per week that he is serving as District M.O.H.

## Hospitals.

#### HOSPITAL POLICY OF THE ASSOCIATION.

167. The Voluntary Hospital Policy (United Kingdom) as approved by the A.R.M., 1924, has again been considered by the Council, especially with regard to para. 10 (now 9) thereof. At the A.R.M., 1924 (Mins. 84-87), the following recommendation of the Council was adopted (on a roll call vote), but not by a two-thirds majority of those present and voting:

That para. 10 (now 9) of the Association's Hospital Policy be rescinded as being no longer applicable and that the following be substituted:

10 (now 9). Contributions to hospitals by employers of labour or massed or periodical contributions by employers should be considered as contributions for services rendered or to be rendered.

The voting was as follows:—for the motion, 88; against the motion, 48; abstentions, 12; which shows that a large majority were in favour of the suggested amendment.

Para. 10, which it was proposed to delete, read as follows:

10. Gratuitous contributions to hospitals by employers of labour or by employees should not be treated as the payment of premiums for insurance against the cost of maintenance and medical treatment for sickness or accident, nor as entitling the contributors to claim hospital treatment, either for themselves or for persons nominated by them, but as charitable contributions to be expended at the discretion of those to whom the management of the hospital is entrusted.

168. The Council now considers that para. 9 as adopted by the A.R.M., 1924, should come up for confirmation. It is therefore proposed first of all to delete the old policy, and secondly to substitute the new. It should, however, be noted that the new has in effect already been adopted by the Representative Body as the "policy" of the Association in the following paragraph of the Hospital Policy which was adopted by Minute 93 of the A.R.M., 1924:

33. When the Board of Management of a Voluntary Hospital accepts contributions for patients from an Approved Society, Insurance Company, Contributory Scheme, employer of labour, and/or by massed or periodical payments by employees, the members of the Visiting Medical Staffs should receive recognition of their services, either in the form of an agreed honorarium, or by means of a percentage of all such payments being passed into a special fund. Such honorarium or fund can be allocated in any manner which the Visiting Medical Staff may determine.

The Council recommends:—

**Recommendation:** That para. 10 (now 9) of the Association's Hospital Policy (as adopted by the Representative Body in 1922, Minute 153), be rescinded as being no longer applicable.

**Recommendation:** That the following new para. 9 of the Association's Hospital Policy (as adopted by the R.B. in 1924, Minutes 84-87), be substituted for the para. 10 (now 9) as adopted by the Representative Body in 1922, Minute 153:

"9. Contributions to hospitals by employers of labour or massed or periodical contributions by employees should be considered as contributions for services rendered or to be rendered."

#### ASSOCIATION'S "POLICY AFFECTING HOSPITALS."

169. During the past four years the R.B. has adopted various policies affecting the different aspects of the hospital question, and these have been reprinted in a handy form and circulated to Divisions and Branch Secretaries and to all hospitals in the United Kingdom. Copies have also been put on sale (price 3d.; post free in U.K. 3½d.).

The policies concerned are: (a) Inter-relation and Co-ordination of Hospital Provision in an Area; (b) Hospital Provision in England and Wales—Standards for Hospitals with 100 or more beds; (c) Report on the Utilisation of Municipal Hospitals for Civil Needs; (d) Report on the Utilisation of Poor Law Infirmarys for Civil Needs; (e) Voluntary Hospitals; (f) Contributory Schemes; (g) Contributory Schemes for Private Patients; and (h) Scheme for formation of Local Hospitals Committees.

Copies of the pamphlet were issued to all London and to the principal Provincial newspapers. The reception by the Press has been very encouraging, many leading articles having appeared, with, so far as is known, no unfavourable comment.

#### UTILISATION OF POOR LAW HOSPITALS FOR CIVIL NEEDS; LOCAL GOVERNMENT (REMOVAL OF DISQUALIFICATION) BILL.

170. This Bill was introduced in the last Parliament and was intended to relieve the disqualification for office on any local authority of any individual who had, personally or through a member of his family, received emergency medical treatment at the charge of the poor rate, but who had repaid the whole cost of such assistance.

The policy of the Association bearing on this point is, that so far as practicable, the spare beds in Poor Law Infirmarys should be utilised for civil needs, but as the law stands at present a person who is an inmate of a Poor Law Institution for the purpose of receiving medical or surgical treatment, even though he or she repays the whole cost involved, becomes disqualified for the receipt of an old age pension at the expiration of three months from the date of entry.

The position was reported to Lt.-Col. Fremantle, M.P., and he and the promoter of the Bill expressed themselves in favour of the Association's policy on this matter, and stated they would do all that was possible with a view to getting the Bill amended accordingly.

The Bill passed second reading and Committee Stage, but dropped with the dissolution of Parliament in October, 1924.

## Naval and Military.

### REPRESENTATIVE OF R.N.M.S. ON THE COUNCIL.

171. The term of office of Surgeon Rear-Admiral Sir Percy Bassett-Smith as the representative of the Royal Naval Medical Service on the Council expires at the end of this session. Under the provisions of the By-laws Sir Percy Bassett-Smith is eligible for re-election for a further period. The Council accordingly recommends:—

**Recommendation:** That Surgeon Rear-Admiral Sir Percy Bassett-Smith, K.C.B., C.M.G., R.N. (ret.), be elected to represent the Royal Naval Medical Service on the Council for the period 1925-8.

### TERRITORIAL ARMY MEDICAL SERVICE.

172. The Council has considered the following Minute 175 of the A.R.M., 1921:—

Resolved: That the following motion be referred to the Council:—

That, in view of the extreme shortage of medical officers in the Territorial Army and the desirability of retaining men of experience in that Army in case of emergency, pressure be brought to bear on those in authority for the age of retirement to be raised—that is, that for a Captain from 45 to 50, and for a Major to 55.

The Council finds that there are many objections to raising the age limit as suggested. In the first place it would, the Council considers, obstruct promotion, and in the second place, it is not satisfactory that an officer over 45 years of age should, in the event of mobilisation, be doing the duties of Captain. The Council accordingly has taken no action on the lines of Minute 175.

### SENIOR SURGEON COMMANDERS COMPULSORILY RETIRED.

173. With the introduction, in 1919, of new rates of pay for the Royal Navy, the Admiralty introduced a Regulation which provided that, as from January 1st, 1920, Commanders (including Surgeon Commanders) were to retire at the age of 50 instead of 55 as was formerly the case. The loss to the officers affected amounted to approximately £440 for each year of service lost, and there was a general feeling in the profession that these officers had been unjustly treated. This feeling of dissatisfaction was moreover aggravated by the small increase in pension (about 10 per cent.) given to Surgeon Commanders in the 1919 revision.

174. As long ago as November, 1919, this matter was taken up with the Admiralty, which declined to make any concession to the officers affected. From that time onwards the Association has continued to press the claims of these officers; the respective First Lords of the Admiralty have been approached, informal meetings have taken place with the Parliamentary Secretary of the Admiralty and with Members of Parliament, and other steps have been taken. The result, however, was always the same—the Admiralty (beyond giving an assurance that in no case would the pension of these officers be reduced below £547. 10s.) declined to remedy the grievance or indeed to acknowledge that there was a grievance. As a result the Council placed the full facts before the profession through the columns of the *Journal* and advised members of the profession who might be considering joining the Navy seriously to consider the disadvantages to which they were liable. This position was approved by the Representative Meeting at Glasgow in 1922, and no statement concerning the conditions of service of the R.N.M.S. has appeared in the *Educational* numbers of the *Journal* for the past three years.

175. As a result of the acute shortage of medical officers in the R.N.M.S., the Admiralty received in January, 1924, a deputation from the Association when the whole position was discussed. Unfortunately the Admiralty was unable to make any statement following on that interview in time for the Bradford Representative Meeting. On November 15th, however, the Council received from the Admiralty a proposal

to pay a maximum gratuity of £250 (on a sliding scale) to those Surgeon Commanders compulsorily retired for age in the five years between July 1st, 1919, and 30th June, 1924.

176. The Council, gratified as it was that the Admiralty had at last made an offer, felt that the above proposal was quite inadequate. Feeling, however, that it was desirable, in the interests of the profession and of the R.N.M.S. that there should be a settlement of this long-continued dispute, the Council informed the Admiralty that it would be prepared to accept a maximum of £500 (on a sliding scale) although it did not consider that even this sum afforded adequate compensation for the loss sustained by the officers affected. The Admiralty replied stating that it was prepared to increase the maximum gratuity from £250 to £300.

177. After consulting the officers affected (the great majority of whom favoured acceptance of the Admiralty's proposal), the Council, feeling that there was little prospect, if any, of obtaining better terms from the Admiralty, and noting that an adequate number of candidates are now coming forward for entry into the R.N.M.S., decided (i.) to accept the revised proposal, and (ii.) that the attitude of the Association of discouraging members of the profession from entering the R.N.M.S. should no longer be continued.

178. The Association at its deputation with the Admiralty in January, 1924, placed before the Admiralty certain suggestions with a view to popularising the conditions of service of the R.N.M.S. The Council has again drawn the attention of the Admiralty to these matters in the hope that something will be done so as to re-establish the position which the R.N.M.S. formerly held.

#### SHORTAGE OF CANDIDATES FOR THE R.A.M.C.

179. The shortage of candidates for the R.A.M.C., concerning which the Council reported fully to the Bradford Representative Meeting, has again engaged the serious attention of the Council. The War Office was informed in December that it was recognised that some of the causes of complaint made by Majors and Captains would be removed, or at any rate mitigated, if recruiting for the Corps again became normal, and the Council accordingly expressed itself as all the more anxious to see the reforms carried out which it had repeatedly, and over a long period of time, urged on the War Office. One of the most important of these reforms is the need for an increase in the pay of Majors between fifteen years' service and the date of their promotion to Lieut.-Colonel.

180. It is, however, not sufficient for the War Office to take steps to remedy the grievances of serving officers. Everything possible must be done to ensure a steady flow of candidates into the Corps. In spite of the over-crowding of the profession young graduates will not enter the Corps in sufficient numbers to fill the vacancies, and the Council has suggested to the War Office that the question of the pay in the junior grades should be given careful consideration.

181. If something be done in this connection and steps be taken to meet grievances of Majors, the Council has assured the War Office that it will do all it can through the columns of the *Journal* and otherwise to induce candidates to come forward. The Army Council has replied stating that it has formulated proposals for improving the conditions of service in the R.A.M.C., which it hopes to be able to communicate to the Association at an early date. The Council now awaits these proposals.

#### RETIRED PAY OF MAJORS, R.A.M.C.

182. The question of the retired pay of Majors, R.A.M.C., is receiving the careful attention of the Council. The pre-war retired pay of these officers with twenty years' service was £365 per annum, but it was found, when the rates were revised in 1920, that they had actually been reduced to £321. When the attention of the War Office was called to the matter, a sum of £75 per annum all round was added, bringing the Major's pension to £396. The reduction in these pensions (in accordance with the cost of living) may reach a maximum of 20 per cent., and a reduction of 5½ per cent. has already been made thus bringing the retired pay very near to the pre-war figure. With the enforcement of the remaining 14½ per cent. (by stages), the retired pay of these officers may possibly be reduced to £326—a figure considerably below what they understood they would receive when they entered the Service. A case has actually occurred in which the new method of reckoning retired pay has

resulted in an officer who had twenty years' service being assessed at £318, which has already been reduced to £328, and can be reduced eventually to £280. This is in spite of the fact that he had served the majority of his time under the old warrant which gave him a fixed £365 per annum.

#### THE ROYAL COMMISSION ON THE SUPERIOR CIVIL SERVICES IN INDIA.

183. The Council appointed a Special Committee to consider the report of the Royal Commission on the Superior Civil Services in India (Lee Commission), and the relation of the Association to the medical profession in India. The present position in regard to the report of the Lee Commission is that certain of its recommendations have been accepted by the Government of India and the Secretary of State, but that no pronouncement has yet been made with regard to the proposals for the re-organisation of the medical services in India outlined in the report of the Commission.

The Council has been in communication with the Secretary of State on this important matter, and has been informed that he will be in a better position to examine the Association's conclusions when the proposals of the Government of India are before him.

#### Scotland.

##### MEMBERSHIP.

184. It is gratifying to be able to report that the steady growth in the membership recorded last year continues to be maintained. The total membership in Scotland at 31st December was 2,060 as compared with 2,614 at the corresponding date in the previous year. In this connection the meetings for graduands, held in the various University centres, particularly Edinburgh and Glasgow, have proved to be a valuable means of recruiting the membership and of interesting graduates in the activities of the Association. After one of the Glasgow meetings over 95 per cent. of the graduands applied for membership.

##### MINIMUM SCALE OF SALARIES FOR PUBLIC HEALTH OFFICERS.

185. Throughout the year the Scottish Committee has maintained its efforts to promote the scale of salaries for the Public Health services which has been adopted by the Association, and has met with a certain degree of success. In some instances it was unfortunately not possible to make any impression, though in every case where a protest was made on the ground of inadequacy of salary the field of choice of candidates was limited. In some, concessions were made to the Association which improved the terms as compared with those originally offered, though not conceding the full scale. In the case of the medical officer of health for Lanarkshire a notable victory was gained. An appointment has been made at the scale commencing salary of £1,300 as compared with £1,000 which was the salary paid to the retiring officer.

A deputation from the Committee met in conference with a Committee of the Board of Health and advocated the adoption of the scale as the standard for Scotland. The Committee of the Board was not unsympathetic, but suggested for consideration some modifications. The Council has authorised the Committee to continue negotiations with the Board and with local authorities in Scotland for the adoption of a modified agreed scale, and the negotiations are still proceeding at the time of reporting. Pending agreement, the scale as adopted by the Council (Appendix IV.) will be insisted upon and will be regarded as the standard to which Scotland should, if possible, adhere.

##### FEES TO PRACTITIONERS CALLED IN BY MIDWIVES.

186. It was reported to the Committee that the legal advisers to the Board of Health had ruled that, in terms of the Midwives (Scotland) Act, every fee paid covers one subsequent visit, and the Committee asked that the scale should be therefore revised or, alternatively, that the Act should be amended. The Board have intimated that they intend to insert in an amending Act a proviso to meet the difficulty, and the Committee has agreed not to press for an alteration in the scale pending the amendment.

##### FATAL ACCIDENTS AND SUDDEN DEATHS INQUIRIES.

187. The Committee is giving careful consideration to reports received of two inquiries held in Scotland into cases of sudden death where the verdict of the jury imputed blame to the doctors who had been in attendance. The full

significance of the provision of the Fatal Accidents and Sudden Deaths Inquiry Act of 1906 does not seem to have been realised hitherto, and a Sub-Committee has been appointed to consider and report upon the question.

#### ATTENDANCE ON STREET ACCIDENTS.

188. It having been reported that the number of street accidents seems to be on the increase, and that the police do not always accept liability for payment of a doctor called to attend such, a letter has been addressed to the Secretary for Scotland asking if he will issue instructions to Chief Constables similar to those issued by the Home Office in England.

#### SCOTTISH HOUSE OF THE ASSOCIATION.

189. The premises occupied by the Scottish Committee since 1919 having proved to be quite inadequate for the increasing work, the Committee made representation to the Council that suitable premises should be purchased. The representation was sympathetically received, and premises at 6, Drumsheugh Gardens, Edinburgh, have been purchased. The premises are in every way suitable, being conveniently situated in the west-end and commodious enough to satisfy all requirements. Besides ample office accommodation a large room is being adapted for a meeting place, which it is hoped will be found to be useful to kindred societies as well as convenient for the Association's own purposes.

The Committee, on behalf of the profession in Scotland has recorded its thanks to the Council. The new house will be entered in the hope and belief that it will be a stimulus to further activity and increased usefulness to the Association and the profession.

#### Wales.

190. The Welsh Committee has so far held only one meeting this session. At that meeting it made strong representations to the Council that in view of the special questions affecting the Welsh profession and the fact that there is a Welsh Board of Health which deals with the health affairs of the Province, both the Council and the Welsh Committee needed to be strengthened by the provision of another direct representative from Wales on the Council of the Association. The Council is of opinion that this is a reasonable request, and submits a recommendation on the subject under "Organisation" (see para. 67).

The Committee has taken over from the Welsh Branches the co-ordination of matters connected with contract practice in Wales. Each Division will, as heretofore, be responsible for its own area, but, instead of the North and South Wales Branches having contract practice Committees, the co-ordination of the Division work will be effected through a Sub-Committee of the Welsh Committee. A strong and representative Sub-Committee has been appointed which will meet generally in Cardiff, as most of its work will come from South Wales.

#### Ireland.

191. The membership of the Association in Northern and Southern Ireland has steadily increased. The resignations at the end of the year 1924 were comparatively few. The members who were struck off the list for arrears were, however, considerably in excess of the resignations. It is satisfactory to be able to state in these cases that as a result of a reminder from the Irish Medical Secretary the majority of those in arrears forwarded their subscriptions and expressed their desire to continue their membership. The Irish Medical Secretary has during the past year organised and attended meetings of the medical profession in twenty counties. The meetings were in all cases a success and averaged an attendance of 65 per cent. of the medical practitioners in actual practice. The Irish Medical Secretary, as in former years, attended meetings of County Health Boards in connection with the salaries of the District Medical Officers, with satisfactory results generally. The Irish Medical Committee is still in existence, and much of the work which is done by it, especially under the Insurance Act, is similar to that which is transacted by the Insurance Acts Committee for English doctors. The services of the Irish Medical Secretary are placed gratuitously by the Irish Committee of the Association at the disposal of the Irish Medical Committee whose membership is mainly made up of members of the Association.

Committees of Inquiry have been appointed by the Irish Free State and Northern Parliaments to report with regard to the reforms that might be advantageously adopted with regard to

the Insurance Acts and the medical services generally. The profession is represented upon both bodies, which have already collected a considerable amount of evidence, and their reports are expected to be published at an early date. The interests of the profession are being looked after by composite medical committees in Northern and Southern Ireland.

192. In the Dail (Southern Ireland) two Acts have been passed of much importance and interest to the profession in the Free State. One is the Medical Act, 1924, which is an Act to authorise the General Medical Council to continue for one year to exercise jurisdiction and authority as heretofore in respect of medical practitioners in the Free State. The second is the Local Government and Public Health Act. This Act provides for the abolition of District Councils in Ireland, and transfers the sanitary laws administered by these bodies to the County Councils. It provides also for the appointment of whole-time County Medical Officers of Health. In connection with these officers the Ministry of Local Government and Public Health has already made arrangements for three scholarships in the Rockefeller Institute of Public Health. Candidates will be selected for these scholarships by a Selection Board, and they must possess diplomas either in public health or sanitary science. The selected candidates will study Public Health for a prescribed time in the Rockefeller Institute, and on their return to Ireland will be appointed County Medical Officers of Health in the Free State.

193. The Council in congratulating the Irish Medical Secretary (Dr. T. Hennessy) on his election by a handsome majority as a member of the Irish Free State Dail expressed the opinion that the excellent services rendered to the profession by him will be greatly enhanced by his presence in the Dail, but has asked the Irish Committee to report on the question of how far his membership of the Dail will be compatible with his duties to the Irish Office of the Association.

#### Oversea Branches.

##### ADVISORY COMMITTEE RE AFRICAN SERVICES.

194. The request of the Council to be allowed to nominate a representative to serve as a member of the Advisory Committee set up by the Secretary of State for the Colonies to investigate the possibilities of unified administration of the African Services was declined, the Colonial Office stating that the constitution of that Committee had already been decided and that the Secretary of State considered that the inclusion of Dr. Andrew Balfour as a member thereof would ensure adequate representation of the views of the medical profession. Dr. Balfour has accepted the Council's offer to place at his disposal such information as the Association possesses as may be of assistance to him as a member of the Advisory Committee. The Council has informed the Colonial Office that it considers that a nominee of the Association could be very useful and ought to be appointed.

The Colonial Office has in reply stated that the Association's letter will be laid before the Advisory Committee with a view to the Association being invited to give evidence before that Committee should it consider such a course desirable.

##### PARLIAMENTARY COMMISSION VISITING EAST AFRICA.

195. In the middle of 1924, the Colonial Office appointed a Parliamentary Commission to visit East Africa. The personnel of the Commission was:

The Hon. Wm. Ormsby-Gore (Chairman), Mr. A. G. Church, Mr. F. C. Linfield and Mr. J. J. A. Calder,

and the terms of reference were as follows:

"To visit Northern Rhodesia, Nyasaland, Tanganyika, Uganda and Kenya with a view to obtaining as much information as possible in the time available on all subjects covered by the terms of reference to the East Africa Committee, and to report to the Secretary of State on any facts which they may consider have a bearing on the above matters."

A letter was sent by the Council to the Secretaries of all the East African Branches of the Association notifying them of the impending visit of the Commission. The Kenya Branch has reported that it had sent a memorial to every member of the Commission, and the Council will render what assistance it can in connection with the matters dealt with in the Memorandum.

## APPENDIX II.

REVISED REPORT OF CENTRAL ETHICAL COMMITTEE  
ON INDIRECT METHODS OF ADVERTISING.

1. During the past few years there have been brought to the attention of the Association certain journalistic developments which seem likely, if unchecked, seriously to undermine some of the most cherished traditions associated with medical practice in this country, and to lower the reputation of the profession among the more thoughtful sections of the community.

2. In May, 1905, in consequence of representations made by the Association, the General Medical Council issued the following Notice:

"The practice of (a) advertising by a registered medical practitioner with a view to his own gain, particularly if depreciatory of other practitioners, or of sanctioning such advertising, of (b) employing or sanctioning the employment of agents or canvassers for the purpose of procuring patients, and of (c) associating with or accepting employment under any Association which practises canvassing or advertising for the purpose of procuring patients are in the opinion of the Council contrary to the public interest and discreditable to the profession of medicine, and any registered medical practitioner resorting to any of such practices renders himself liable on proof of the facts to have his name erased from the Medical Register."

The result has undoubtedly been a great decrease in the cruder and more open forms of advertisement. The issue of handbills announcing the qualifications of medical practitioners and the door-to-door canvass for members of medical clubs are now only occasional occurrences. Of recent years, however, a subtle and indirect method of giving publicity to certain medical practitioners has obtained currency in the text and illustrations of the lay press sometimes without and sometimes apparently with the active concurrence of those referred to. This publicity, by reason of the form that it takes and the medium that it adopts, results in a very effective advertisement for the person concerned. Such means of personal advancement may be considered legitimate in other walks of life but have in the past been shunned as undignified by the medical profession.

3. In February, 1922, the Association again addressed a communication to the G.M.C. asking if the time had not arrived when some authoritative pronouncement on the subject should be made. The G.M.C. replied (i.) that if a new offence not within the present Warning Notices was becoming prevalent, a flagrant case might be selected to be brought before the Council which would give it careful attention; and (ii.) that it was not the custom of the Council to issue a Warning Notice until the hearing of a case had established the need for it.

At the December, 1922, Session of the G.M.C., however, one of the direct representatives of the profession on the General Medical Council raised the question afresh. As a result, it was remitted to the Executive Committee of the Council in consultation with the legal advisers, to consider and report upon the expediency of amending the Council's Warning Notice with respect to canvassing and advertising so as to make its scope more clear and comprehensive.

4. At the June, 1923, Session of the G.M.C., the following new paragraph 6 of the Warning Notice was adopted:

## "6. ADVERTISING AND CANVASSING.

The practices by a registered medical practitioner—

(a) Of advertising, whether directly or indirectly, for the purpose of obtaining patients or promoting his own professional advantage; or, for any such purpose, of procuring or sanctioning or acquiescing in the publication of notices commending or directing attention to the practitioner's professional skill, knowledge, services, or qualifications, or depreciating those of others; or of being associated with or employed by these who procure or sanction such advertising or publication, and

(b) Of canvassing or employing any agent or canvasser for the purpose of obtaining patients; or of sanctioning or of being associated with or employed by those who sanction, such employment;

are in the opinion of the Council contrary to the public interest and discreditable to the profession of medicine, and any registered medical practitioner who resorts to any such practice renders himself liable on proof of the facts to have his name erased from the Medical Register."

5. Examples of the newer methods are to be found in interviews granted to newspaper representatives, and in signed letters or articles sent to newspapers. In many of these, members of the profession, either by the direct assertion of the journalists concerned, or by more indirect methods, are referred to as possessing, or allow it to be inferred from their own words that they possess, methods of treatment superior to those practised by others.

6. In the opinion of the Committee the word "advertising" in connection with the medical profession must be taken in its broadest sense, to include all those ways by which a person is made publicly known, either by himself, or by others without his objection, in a manner which can fairly be regarded as "for the purpose of obtaining patients or promoting his own professional advantage."

7. It is generally accepted by the profession that certain customs are so universally practised that it cannot be said that they are for the person's own advantage, as, for instance, a door-plate with the simple announcement of the doctor's name and profession. Even this, however, may be abused by undue particularity or elaboration.

8. It is commonly agreed that channels must be open for discussion between members of the profession for recording the results of research and clinical experience and for bringing to the notice of other members books published and facilities for treatment offered. The recognised channels are medical societies, medical periodicals, and works primarily intended for the medical profession. The information so given is intended for the convenience and advantage of the profession which will be in a position to judge of the value of the information and of the manner in which it is conveyed. Even this legitimate kind of advertisement is capable of abuse.

9. It is the recognised duty and right of a medical man to take his share as a citizen in public life, but there is no reason why this should involve any advertisement of himself as a doctor, and, with due care, improper advertisement can be avoided.

10. Publicity is rightly allowed to medical men not in actual practice of their profession since they cannot be regarded as using this publicity for the purpose of promoting their own professional advantage, and in view of the official position of Medical Officers of Health and other medical men who hold posts in either the public health or other public service, publicity is sometimes not only permissible but necessary for the fulfilment of their official duty. The presumption in all these cases is that publicity is not sought for the individual's own gain though it is possible that the practice might be abused and the presumption therefore fail.

11. The publication of books and the delivery of lectures on semi-medical topics which are of general public interest and require medical knowledge for their proper presentation have been recognised as legitimate, subject to the avoidance of methods which tend to the personal professional advantage of their authors. There are many things innocent in themselves which may, by the manner and frequency of their doing, gravely contravene the principle that medical practitioners should not advertise.

12. From time to time there are discussed in the lay papers topics which have relation both to medical science and policy and to the health and welfare of the public, and it may be legitimate or even advisable that medical practitioners who can speak with authority on the question at issue should contribute to such discussions. But practitioners who take this action ought to make it a condition of publication that laudatory editorial comments or headlines relating either to the contributor's professional status or experience shall not be permitted; that his address or photograph shall not be published; and that there shall be no unnecessary display of his medical qualifications and appointments. There is a special claim that practitioners of established position and authority shall observe these conditions for their example must necessarily influence the action of their less recognised colleagues. Discussions in the lay press on disputed points of pathology or treatment should be avoided by practitioners; such issues find their appropriate opportunity in the professional societies and the medical journals.

13. After making all allowances for all those modes of publicity for which there may be some justification, there remain many instances which can only be regarded as gravely and unnecessarily contravening the spirit of the notice of the G.M.C. The Association is convinced that in taking up an attitude of determined opposition to these undesirable journalistic methods, the Association is acting in the best interests of the public as well as of the medical profession. The extension of the system can only lead to a competition

for public notice in which the more scrupulous man would be left behind, to the detriment of the public who are ill-qualified to judge of the true worth of scientific opinions. The extension of the advertising habit among the profession in general would certainly destroy those traditions of dignity and self-respect which have helped to give the British medical profession its present high status, and would gravely undermine the amenities and harmonious working of medical practice.

14. The Association, therefore, draws the attention of the profession to the danger of these objectionable methods, and insists upon the urgent need that every member of the profession who values its honour should offer a firm resistance to them. If only those whose reputation is mainly derived from newspapers allow their names and opinions to be quoted or to appear as those of "the eminent" physician, surgeon or specialist, the practice will die a natural death.

### APPENDIX III.

#### MEMORANDUM ON THE POLICY OF THE ASSOCIATION WITH REGARD TO CORONERS' LAW AND DEATH CERTIFICATION.

##### A. DEATH CERTIFICATION AND REGISTRATION.

###### MEDICAL CERTIFICATION OF DEATH AND STILL-BIRTH.

1. Every death and every still-birth should be certified on a statutory form issued by the Registrar-General by a registered medical practitioner who has viewed the body. Such certificates should, if possible, be signed by a practitioner who has attended the deceased during life or been called in at or about the time of death or still-birth. Where no such practitioner is available, the certificate of death or still-birth should be signed by a special medical officer appointed (as provided in paragraph 26 below) for every coroner's district by the authority which appoints the coroner.

###### REPORT TO REGISTRAR.

2. In addition to the certificate of the fact of death there shall be sent direct to the Registrar a further report including further facts as to the cause of death and any scientific data which the practitioner who certifies the death considers necessary or desirable.

###### OBLIGATION TO CERTIFY DEATH.

3. Where a medical practitioner has attended a deceased person within 14 days of death, and where such person has died within the area in which the practitioner ordinarily practises or attended at the birth of a still-born child, it shall be his duty within 24 hours after he has become aware of the death or still-birth to complete and sign the prescribed form of certificate, and, in the case of death, to draw up the detailed report referred to in para. 2 and to send it direct to the registrar in a sealed envelope.

###### CASE IN WHICH A PRACTITIONER IS UNABLE TO COMPLETE THE DEATH CERTIFICATE.

4. If the cause of death is unknown to the practitioner attending for the purpose of certifying, or if he is of opinion that death has arisen from or been accelerated by any violence, directly or indirectly, or through neglect or poison or other unnatural cause, he shall not grant any certificate of death, but shall forthwith report the circumstances and his opinion to the coroner for the district in which the death has occurred.

###### PROVISION FOR RECORD OF REPORTS.

5. The report referred to in para. 2 should be so filed by the registrar as to form a separate register, and such register shall not be open to inspection except by a coroner or a medical officer of health, or the chief superior officer of any police force, or in pursuance of an order by the Secretary of State, or a Court of Summary Jurisdiction, or any Superior Court.

###### REGISTRAR TO COMMUNICATE WITH CORONER IN CERTAIN CASES.

6. In any case in which a registrar receives information of a death and does not receive the prescribed certificate of death, or where, in such certificate the date of the last attendance is more than fourteen days prior to the date of death, or where in any other particular such certificate does not strictly conform with the statutory form he should within 24 hours of receiving such information report the case to the coroner of the district in which the death has occurred.

#### REMUNERATION OF MEDICAL PRACTITIONERS.

7. The following fees should be payable by the local sanitary authority to registered medical practitioners, including special medical officers, rendering service under the foregoing provisions:

In the case of a body viewed within one mile of registered address of practitioner or officer ... 5/-  
Additional fee in respect of every mile or part of a mile beyond the above distance ... 2/-

#### FORMS OF MEDICAL CERTIFICATES.

8. The prescribed forms of certificates shall be as follows:—

##### (1) Certificate of Death.

I hereby certify that I attended .....; that such person's age was stated to be .....; that I saw him alive on or about the ..... day of ..... 19...; that he died (as I am informed) on the ..... day of ..... 19..., at ..... and that I viewed the dead body on the ..... day of ..... 19..., and that to the best of my knowledge and belief the cause of his death was as hereunder written.

Cause of Death.	Duration of Disease where known			
	Years.	Calendar Months.	Days.	Hours.
State if due to Natural Causes. .....				
State disease.....				

Witness my hand, this ..... day of ..... 19....

Signature .....

Qualifications as registered by the General

Council .....

Residence .....

##### (2) Certificate of Still-Birth.

I, ..... of ..... do hereby certify that on the ..... day of ..... 19..., at ..... I personally viewed the body of a [male] [female] child and that the said child was (\*stated to me to be) the child of ..... of ..... whom I attended at its birth and that the said child was still-born.

Witness my hand this ..... day of ..... 19....

A.B., of ....., registered medical practitioner or special medical officer appointed by the council of .....

\*If the registered medical practitioner did not attend at the birth insert the words in brackets and strike out the words in italics (underlined).

†Name of mother.

#### B. BURIAL REGULATIONS.

9. Retention in a dwelling-house of a dead body beyond a period of seven days, except by permission of a magistrate or coroner, should be made an offence.

10. It should be made a penal offence to bury, cremate or otherwise dispose of a body except upon a burial order issued by a Registrar or coroner.

11. No burial order should be issued by a Registrar until the death has been registered.

12. The burial order, after it has been acted upon, should be returned to the registrar who issued it, with an endorsement showing the date, place and mode of disposal of the body.

13. Every person in charge of a cemetery, burial ground, churchyard, crematorium, or other place legally authorised for the disposal of dead bodies (a) should, after a burial order has been acted upon, endorse the same, and (b) should keep a register of all bodies buried or otherwise disposed of which should show the name and age of the deceased and the exact place of burial and the name and address of the persons conducting the burial or cremation. Any person failing to obey these provisions should be liable to a penalty.

14. If the burial order, duly endorsed, is not returned to the Registrar within a prescribed period, he shall notify the M.O.H. of the district of the fact, and the M.O.H. shall make the necessary enquiries and report to the Registrar.

## C. CORONERS' LAW.

THE CORONERSHIP. NATURE OF OFFICE, QUALIFICATIONS, APPOINTMENT AND DISMISSAL, AND AREA ADMINISTRATION.

15. The office of coroner should be made administrative and be placed under the control of the Minister of Health. The coroner's duty would then be to make an administrative investigation of the cause of death and his finding would be a simple report. On that finding the death would be registered or the necessary criminal enquiry would be instituted by the police. The necessary connection with the ordinary judicial system could be preserved by making the coroner *ex-officio* a magistrate for the district in which he acts.

16. So far as possible the areas to be administered by coroners should be made co-terminous with Local Government areas.

17. Coroners should possess both legal and medical qualifications. Failing this, a person with a medical training only should be preferred to one having only a legal training. Provided that, where a person has (before the date on which the Act shall come into force) been the deputy of a county or borough coronor, he shall be eligible for appointment as a coroner although he has not the qualification required above.

18. The right to appoint coroners should be confined to county and county borough councils, subject to the approval of the Minister of Health.

19. The removal of coroners from office should only be allowable on the grounds of inability or misbehaviour in the performance of duty; and should be in the hands of the Minister of Health.

## REMUNERATION OF CORONERS.

20. At any quinquennial revision of a coroner's salary regard should be had to the number of deaths the causes of which he has investigated without holding an inquest, as if in each case an inquest had been held.

21. A coroner attending at any court before or at the opening thereof in pursuance of Sub-section 3 of Section 5 of the Coroners' Act, 1887, should be entitled to a fee of 2 guineas for each such attendance, and, in addition, to reasonable travelling expenses, and such fee and such expenses should form part of the expenses of the prosecutor.

## DEPUTY CORONER.

22. The relevant considerations should apply to the appointment of deputy coroner.

## ASSISTANT DEPUTY CORONER.

23. An assistant deputy coroner should be appointed for each county on similar terms.

## RECORDS.

24. All official records of coroners should be the property of the appointing authority.

## CORONER'S OFFICER.

25. If this office is to be retained, the holder should be a police officer.

## SPECIAL MEDICAL OFFICERS.

26. A special medical officer should be appointed by the County Council for every coroner's district or group of coroner's districts. He should examine and report to the coroner in all cases in which the coroner shall so direct; enquire into all cases of death in which a registered medical practitioner has not been in attendance during life; assist in all cases in which the coroner requires medical help beyond that which the medical witnesses otherwise available can give; and certify death if a certificate is not otherwise forthcoming. His appointment should be terminated only with the consent of the Minister of Health.

## CONTROL OVER CORONER.

27. Provision should be made for the adequate control of the coroner and regulation of procedure and practice in coroners' courts by the Minister of Health. This would involve provision for the review of the coroner's conduct in the discharge of his public duties; and for the infliction of lesser penalties for offences not meriting removal from office.

28. There shall be a right of appeal from the finding of the inquest to a Judge of the High Court who would have the power to re-try the case.

## PRELIMINARY ENQUIRY BY THE CORONER.

29. A preliminary enquiry should be held before the expense of an inquest is incurred, and the power of procedure of any coroner in reference to such enquiry, the function of any officer employed therein and the obligation of all persons to give information in connection therewith should be given legal sanction.

30. The coroner should have statutory authority to obtain and pay for any information obtained from a medical practitioner, and to order and pay for the performance of a post-mortem examination whether or not the inquest is subsequently held; but no registered medical practitioner should without his consent be required to make an analysis of the contents of the stomach or intestines or any other part of the body of a deceased person.

## EVIDENCE TO BE OBTAINED AT THE INQUEST.

31. Where the coroner considers the evidence to be insufficient it should be open to him to order a post-mortem to be made either by the medical practitioner with knowledge of the clinical facts or by an expert pathologist specially engaged for the purpose (saving the right of the practitioner concerned, as above—see para. 30).

32. Should the post-mortem be entrusted to an expert pathologist any medical practitioner who has been in attendance at or about the time of death should have the right of being in attendance when the post-mortem is done.

33. When the coroner deems it necessary to call in an expert witness he should be empowered to pay such witness the special fees to which his special experience would entitle him.

34. Section 22 of the Coroners' Act, 1887, should be repealed in order to allow for the remuneration of medical officers of public institutions giving evidence at inquests on persons dying therein.

35. The travelling expenses incident upon giving evidence at inquests should be regulated by statute, and there should be an additional fee for each additional day's attendance.

36. The discretion which the coroner at present possesses of dispensing with the services of a jury should be continued permanently.

## VIEW OF THE BODY.

37. The coroner should in all cases view the body; the view of the body by the jury should not be compulsory but left to the discretion of the coroner.

## CASE OF ALLEGED MURDER OR MANSLAUGHTER.

38. If on an inquest touching a death a coroner is informed before the jury has given its verdict, that some person has been charged before examining justices with the murder or manslaughter of the deceased, he shall, in the absence of reason to the contrary, adjourn the inquest pending the termination of the proceedings before the justices.

## RIGHTS OF PERSONS MENTIONED IN THE COURSE OF INQUIRY.

39. A person whose conduct is called in question by any evidence should be afforded an opportunity to give rebutting evidence, and to be legally represented if he so desires, the inquest being adjourned for this purpose if necessary.

## RE-OPENING OF INQUESTS.

40. The coroner should be given statutory authority to re-open inquests.

## REMUNERATION OF MEDICAL PRACTITIONERS.

41. The fees payable by coroners to registered medical practitioners and special medical officers should be as follows:—

A. Whether an inquest is held or not:—

1. For every report to a coroner where the practitioner or officer is of opinion that death has arisen from or been accelerated by violence, neglect, poison or other unnatural cause, or is unable to certify the cause of death of a deceased person whom he has attended in his last illness, or in any case where the Coroner has called upon the practitioner to make a preliminary report	£.	s.	d.
0 10 6			

2. For making by the previous direction of the coroner a post-mortem examination of the body of the deceased—the like fee as where an inquest is held.

## B. Where an inquest is held :—

£ s. d.

3. For every day of attendance to give evidence in obedience to a summons of the coroner under the Coroners' Act, 1887 ... 1 11 6

4. For making by the previous direction of the coroner a post-mortem examination of the body of the deceased without an analysis of the contents of the stomach or intestines or other part of the body ... 3 3 0

5. For making by such direction an analysis of the contents of the stomach or intestines or other part of the body such fee (in addition to fee No. 3, but not exceeding seven-and-a-half guineas in all) as the coroner shall certify in writing to be reasonable.

## APPENDIX IV.

SCALE OF MINIMUM COMMENCING SALARIES FOR  
WHOLE-TIME CHIEF MEDICAL OFFICERS OF HEALTH  
AND MEDICAL OFFICERS OF OTHER GRADES  
RECOMMENDED FOR ADOPTION AS A STANDARD  
BY LOCAL AUTHORITIES.

	Minimum Salaries per annum.
<b>RESIDENT MEDICAL OFFICERS</b> ...	£330 plus emoluments.
<i>Definition.</i> —These are Medical Officers employed in Hospitals, Sanatoria or other Institutions without responsibility for the work of other Medical Officers.	
<i>NOTE.</i> —Where the Appointing Authority limits the one year and pply, nor shall a professional experience.	
<b>MEDICAL OFFICERS EMPLOYED IN DEPARTMENTS.</b> (Working directly under a Senior Medical Officer.)	£600.
<i>Definition.</i> —These are Medical Officers without responsibility for the work of other Medical Officers, but who shall have had at least three years' experience in the practice of their profession subsequent to obtaining registrable qualifications. One only of these years of service may be spent in the whole time service of a local authority on a probationary basis at a lower salary than the minimum of £600 per annum. The salary during such probationary service shall be at the rate of not less than £500 per annum.	
<b>SENIOR MEDICAL OFFICERS</b> (not being Medical Officers of Health) in charge of Services or Departments (e.g. Port Sanitation, School Medical Service, Tuberculosis, Mental Deficiency, Maternity and Child Welfare, Venereal Disease, or any other similar service or department or combination thereof) and medical superintendents of hospitals, sanatoria, or other institutions.	£750 to £1,100 according to responsibility and scope of department, regard being had to the relation of the officer's salary to that of the Medical Officer of Health.
<b>DEPUTY OR CHIEF ASSISTANT MEDICAL OFFICER</b> (Hospitals, Sanatoria, or other institutions or departments).	A salary equal to 60 per cent. of salary of Medical Superintendent or senior Medical Officer in charge, but not less than the salary of a Medical Officer employed in a department.

CHIEF MEDICAL OFFICERS OF HEALTH.  
(Outside London.)

Population.	Minimum commencing Salaries per annum.	
	County Boroughs, Boroughs, Urban and Rural Districts, and Combined Districts.	County Councils.
	£	£
Not exceeding 50,000	800- 900	—
do. 75,000	900-1,000	800- 900
do. 100,000	1,000-1,100	900-1,000
do. 150,000	1,100-1,200	1,000-1,100
do. 250,000	1,200-1,400	1,100-1,200
do. 500,000	1,400-1,600	1,200-1,400
do. 750,000	1,600-1,800	1,400-1,600
Exceeding 750,000	1,800	1,600-1,800

CHIEF MEDICAL OFFICERS OF HEALTH.  
(Metropolitan Boroughs.)

Population.	Minimum commencing Salaries per annum.
	£
Not exceeding 150,000	1,000 - 1,200
" " 250,000	1,200 - 1,400
" exceeding 250,000	1,400 - 1,800

## PORT MEDICAL OFFICERS.

PORT MEDICAL OFFICERS directly responsible to a Port Sanitary Authority	£800
---	------

*NOTE.*—(1) In cases where a Local Authority appoints a Deputy or Assistant

or Assistant M.O.H. by the

- (2) Health or a Senior Medical Officer the Local Authority assigns a figure in the scale which the British Medical Association thinks inappropriate the Ministry of Health has promised to use its good offices by arranging for joint discussion between the parties concerned, at the Ministry.
- (3) Population means population at the latest annual report of the Registrar-General.

*Conditions applicable to all appointments.*

- The salaries to be fixed are consolidated salaries inclusive of bonus.
- There will be periodical review of salaries by the Local Authorities and suitable increments of salary will be given for proved ability and satisfactory service.
- Travelling expenses and other reasonable expenses properly incurred in the performance of the duties will be paid in addition to salary.
- No existing officer is to be prejudicially affected.

## British Medical Association.

## CURRENT NOTES.

## Secretaries' Conference at Bath.

The Annual Conference of Honorary Secretaries of Divisions and Branches will be held at Bath on Wednesday, July 22nd, at 2.30 p.m. The rail fare within the United Kingdom of one honorary secretary of each Division and Branch attending the Conference is repayable from the central funds of the British Medical Association. The Organization Committee, by instruction of the Council, has under consideration the programme of the conference, and the following matters are provisionally noted for inclusion therein: (a) discussion on the tendency of some Panel Committees to do what is really Association work; and (b) three papers by honorary secretaries on propaganda work, with discussion. The Organization Committee will welcome suggestions from secretaries and other members of the Association for the agenda of the conference.

## Association Notices.

**Thalassotherapy and Esperanto.**  
The British Medical Association has been invited to appoint a delegate to attend the Fourth International Congress on Thalassotherapy, which meets at Arcachon (Gironde) from April 27th to 29th, and the Chairman of Council has been empowered to nominate a suitable representative. A similar course was taken by the International Congress on the Use of Esperanto in the Pure and Allied Sciences, which will be held in Paris, May 14th to 16th. The Medical Secretary will be glad to hear from any member who proposes to attend either of these Congresses.

## Association Notices.

SCHOLARSHIPS AND GRANTS IN AID OF  
SCIENTIFIC RESEARCH.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships, as follows:  
1. AN ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.  
2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1925. A Scholar may be reappointed for not more than two additional terms. A Scholar may hold a junior appointment at a University, Medical School, or Hospital provided the duties of such appointment do not interfere with his work as a Scholar.

The conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

## GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

## Applications.

Applications for Scholarships and Grants for the year 1925-26 must be made not later than Saturday, June 6th, 1925, on the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated to whom reference may be made.

ALFRED COX,  
Medical Secretary.

March 21st, 1925.

## TABLE OF DATES.

April 25, Sat.	Last day for receipt of nominations for election of 24 members of Council by grouped Home Branches, and 4 Public Health members of Council, and 4 Public Health members of Council.
May 9, Sat.	Publication in SUPPLEMENT of nominations for election of 24 members of Council by grouped Home Branches, and 4 Public Health members of Council, and 4 Public Health members of Council. Voting papers posted.
May 12, Tues.	Independent motions for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 16, Sat.	Last day for receipt of voting papers for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 30, Sat.	Publication in SUPPLEMENT of independent motions for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives. A.R.M. Agenda must be received by this date.
June 4, Thurs.	Publication in SUPPLEMENT of results of Council elections and of election of members of Council and Representatives in Representative Body by grouped Branches, and of election of members of Council and Representatives in Representative Body by grouped Branches and Representatives.
June 10, Wed.	Nomination papers available for election of 12 members of Council by grouped Home Representatives must be received by this date.
June 18, Thurs.	Names of Representatives and Deputy-Representatives must be received by this date.
June 27, Sat.	Council Meeting.
July 5, Fri.	Meetings of Constituencies must be held between this date and July 17th to instruct Representatives. Supplementary Report of Council appears in SUPPLEMENT. Amendments and riders for issue in A.R.M. Agenda must be received by this date.

## BRANCH AND DIVISION MEETINGS TO BE HELD.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingland Road, E.8, on Tuesday, April 21st (not April 14th as previously arranged), at 9.30 p.m., when Professor Hugh Maclean, D.Sc., M.D., M.R.C.P., Director of Medical Unit, St. Thomas' Hospital, will read a paper entitled "Diabetes—its treatment: insulin up to date." A Divisional dinner and fancy dress dance and carnival—fancy dress optional (four prizes)—will be held at the Holborn Restaurant on Thursday, April 30th, from 7.30 p.m. to 2 a.m.; bridge. Refreshments during evening. Tickets 15s.; early application will be greatly appreciated by Dr. Ernest A. Worley (honorary secretary), 43, De Beauvoir Road N.1.

**METROPOLITAN COUNTIES BRANCH: HENDON DIVISION.**—The inaugural meeting of the Hendon Division will take place at the Refectory, facing Golders Green Station, N.W., on Thursday, April 23rd, at 8.30 p.m., when local members of the profession, in addition to members of the Division, are invited. Light refreshment will be served.

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—A general meeting of the Kensington Division will be held on Thursday, April 23rd, at the Kensington Palace Mansions Hotel, De Vere Gardens, W.8, at 8.45 p.m. An address will be given by Dr. Seymour Taylor, consulting physician to the West London Hospital, entitled "Some medical aphorisms."

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.**—A meeting of the Lewisham Division will be held at the Parish Room, St. Laurence Vicarage, Bromley Road, Catford, S.E.6, on Tuesday, April 21st, at 8.45 p.m., when Dr. F. A. Beattie will preside. Agenda: Mr. G. Gordon-Taylor, O.B.E., M.S., F.R.C.S.: Haemorrhages in connection with gastric and duodenal ulcers; election of Representative and Deputy Representative of the Division for the Annual Meeting at Bath; to receive report from Dr. Charsley on motion before Branch Council; any other business.

**METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.**—A meeting of the South Middlesex Division will be held at St. John's Hospital, Twickenham, on Wednesday, April 15th, at 8.15 p.m., for general business. At 8.30 p.m. Dr. H. C. Corry Mann, O.B.E., will read a paper on dietary during the school age.

**METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISION.**—The annual general meeting of the Westminster and Holborn Division will be held at the Criterion Restaurant on Thursday, May 7th, at 8.30 p.m. After the business a paper will be read by Sir William J. Collins, K.C.V.O., M.D., F.R.C.S. entitled "The control of the traffic in drugs of addiction." The meeting will be preceded by dinner at 7.30, the price of which (5s.) should be paid to the Secretary at the table. A large attendance is hoped for.

**METROPOLITAN COUNTIES BRANCH: WILLESDEX DIVISION.**—A meeting of the Willesden Division will be held at the Willesden General Hospital, Harlesden Road, on Wednesday, April 22nd, at 9 p.m. Agenda: Election of Representative and Deputy Representative in the Representative Body; Annual Report of Council (published in this issue of the SUPPLEMENT).

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—At the meeting of the Chesterfield Division, to be held at the Maternity Hospital, Chesterfield, on Friday, April 17th, at 8.30 p.m., Mr. A. M. Connell, Professor of Surgery in the University of Sheffield, will give an address on injuries to the lower extremity.

**NORFOLK BRANCH.**—A meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital at 3.30 p.m. on Wednesday, April 15th, when an address will be given by Dr. William Norwood East, Chief Medical Officer of H.M. Prisons Commission, on the interpretation of some sexual offences. Afternoon tea, 4.45.

**NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.**—A scientific meeting of the Sunderland Division will be held at the Mental Hospital, Ryhope, on Wednesday, May 27th, at 3.30 p.m. All members of the Division are invited to be present.

**SOUTHERN BRANCH: WINCHESTER DIVISION.**—A meeting of the Winchester Division will be held at Lord Mayor Treloar Cripples Hospital and College, Alton, on April 23rd, at 3 p.m., when the wards will be open for inspection, and the various kinds of treatment, etc., in use explained. Sir Henry Gauvain has kindly invited members to tea at the conclusion of the meeting. It will be great convenience if members who intend to be present will not the honorary secretary (Dr. W. A. Bruce Young, Everthorpe, F Hill, Winchester) a few days before the meeting.

**SURREY BRANCH: CROYDON DIVISION.**—The annual dinner of the Guild-Croydon Division will be held at the Greyhound Hotel, Croydon, on Friday, April 17th, at 8 p.m.

**SURREY BRANCH: GUILDFORD DIVISION.**—A meeting of the Guildford Division will be held at the Royal Surrey County Hospital, Guildford, on Thursday, April 23rd, at 4 p.m., when Mr. Dudley Buxton will read a paper on the treatment of common disabilities of the feet. Tea will be served at 3.45 p.m.

**YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.**—A meeting of the Wakefield, Pontefract, and Castleford Division will be held at the Bull Restaurant, Westgate, Wakefield, on Thursday, April 23rd, at 8.30 p.m., when Mr. J. F. Dobson, F.R.C.S. (Leeds), will read a paper on urological diagnosis illustrated with lantern slides. Supper at 8 o'clock.

# British Medical Association.

## NINETY-THIRD ANNUAL MEETING, BATH, JULY 21st to 24th, 1925.

Patron: HIS MAJESTY THE KING.

President: J. BASIL HALL, M.Chir., F.R.C.S., Consulting Surgeon, Royal Infirmary, Bradford.

President-Elect: FREDERICK GEORGE THOMSON, M.A., M.D., M.R.C.P., Physician, Royal United Hospital, Bath.

Chairman of Representative Body: HENRY BRITTEN BRACKENBURY, M.R.C.S., L.R.C.P.

Chairman of Council: ROBERT ALFRED BOLAM, M.D., LL.D., F.R.C.P.

Treasurer: N. BISHOP HARMAN, M.A., M.B., F.R.C.S.

### PROVISIONAL PROGRAMME.

BATH ABBEY.

**T**HE incoming President will deliver his address to the Association on Tuesday, July 21st.

The ANNUAL REPRESENTATIVE MEETING will begin on Friday, July 17th, at 10 a.m., and be continued on the three following week-days.

The statutory ANNUAL GENERAL MEETING will be held on July 21st at 2 p.m., and the adjourned general meeting at 7.45 p.m.

The Annual Dinner of the Association will take place on Thursday, July 23rd.

The Conference of Secretaries will be held at 2.30 p.m. on Wednesday,

July 22nd, and the Secretaries' Dinner at 6.30 the same evening.

The Annual Exhibition of surgical appliances, foods, drugs, and books will be opened by the President-Elect on July 21st at 9.30 p.m., and will remain open on July 22nd, 23rd, and 24th.

A Popular Lecture will be delivered by Sir W. H. Bragg, K.B.E., F.R.S., on Friday, July 24th, at 8 p.m.

Saturday, July 25th, will be given up to excursions to places of interest in the neighbourhood.

A provisional time-table of the principal events appears on page 170.

### THE SECTIONS.

The Scientific Sections will meet from 10 a.m. to 1 p.m. for papers and discussions, and it is hoped that laboratory and clinical demonstrations will be arranged for the afternoons of July 22nd, 23rd, and 24th.

The following Sections will meet on Three Days—Wednesday, Thursday, and Friday, July 22, 23, and 24.

#### MEDICINE.

President: The Right Hon. Lord DAWSON OF PENN, G.C.V.O., K.C.M.G., C.B., M.D., F.R.C.P. (London).

Vice-Presidents: E. J. CAVE, M.D., F.R.C.P. (Bath); T. R. ELLIOTT, D.S.O., C.B.E., M.D., F.R.C.P., F.R.S. (London); Professor J. A. NIXON, C.M.G., M.D., F.R.C.P. (Bristol); Professor ADAM PATRICK, M.D., M.R.C.P. (Dundee); W. N. WEST WATSON, M.D. (Bradford).

Honorary Secretaries: F. G. CHANDLER, M.D., M.R.C.P., 1, Park Square West, Portland Place, London, N.W.1; JAMES LINDSAY, M.D., M.R.C.P., 1, The Circus, Bath.

#### SURGERY.

President: Sir BERKELEY MOYNIHAN, Bt., K.C.M.G., C.B., M.S., LL.D., F.R.C.S. (Leeds).

Vice-Presidents: A. H. BURGESS, M.B., F.R.C.S. (Manchester); FREDERICK LACE, F.R.C.S. (Bath); H. S. SOUTAR, C.B.E., M.Ch., F.R.C.S. (London); C. F. WALTERS, F.R.C.S. (Bristol).

Honorary Secretaries: A. DE V. BLAYNEY, M.R.C.S., L.R.C.P., 6, Brock Street, Bath; A. L. FULLER, F.R.C.S.I., 9, Gay Street, Bath; R. M. VICK, O.B.E., M.Chir., F.R.C.S., 152, Harley Street, London, W.1.

#### OBSTETRICS AND GYNAECOLOGY.

President: Lady BARRETT, C.B.E., M.D., M.S. (London).  
Vice-Presidents: H. S. DAVIDSON, O.B.E., M.B., F.R.C.S. (Edinburgh); EARDLEY L. HOLLAND, M.D., F.R.C.P., F.R.C.S. (London); W. F. RAWSON, F.R.C.S. (Bradford); D. C. RAYNER, F.R.C.S. (Bristol).

Honorary Secretaries: J. BRIGHT BANISTER, M.D., M.R.C.P., 19, Harley Street, London, W.1; W. H. DUNCAN, F.R.C.S. (Ed.), 35, Gay Street, Bath.

#### PATHOLOGY AND BACTERIOLOGY.

President: Professor J. C. G. LEDINGHAM, C.M.G., D.Sc., M.B., F.R.C.P., F.R.S. (London).

Vice-Presidents: J. A. BRAXTON HICKS, M.D., M.R.C.P. (London); Professor E. H. KETTLE, M.D. (Cardiff); RUPERT WATERHOUSE, M.D., M.R.C.P. (Bath).

Honorary Secretaries: Lieut.-Colonel JAMES COWAN, M.B., R.A.M.C. (ret.), 44, Combe Park, Bath; C. C. OKELL, M.B., M.R.C.P., Wellcome Physiological Research Laboratories, Langley Court, Beckenham, Kent.

#### NEUROLOGY AND PSYCHOLOGICAL MEDICINE.

President: Sir MAURICE CRAIG, C.B.E., M.D., F.R.C.P. (London).

Vice-Presidents: EDWIN BRAMWELL, M.D., F.R.C.P. (Edinburgh); ARTHUR P. HURST, M.D., F.R.C.P. (Aston); NORMAN LAYERS, M.D. (Bath); S. A. K. WILSON, M.D., F.R.C.P. (London).

Honorary Secretaries: RAY EDWARDS, M.R.C.S., L.R.C.P., 29, Gay Street, Bath; EDWARD MAPOTHER, M.D., M.R.C.P., Maudsley Hospital, Denmark Hill, London, S.E.5.

#### THERAPEUTICS (INCLUDING BALNEOLOGY AND RADIO-THERAPY).

President: Professor R. B. WILD, M.D., F.R.C.P. (Chislehurst, Derbyshire).

Vice-Presidents: PRESTON KING, M.D. (Bath); W. MITCHELL, M.B., C.M. (Bradford); NATHAN MUTCH, M.D., F.R.C.P. (London).

Honorary Secretaries: DOROTHY C. HARE, C.B.E., M.D., M.R.C.P., 1, Bickenhall Mansions, London, W.1; CECIL H. TERRY, M.B., 15, The Circus, Bath.

#### LARYNGOLOGY, OTOTOLOGY, AND RHINOLOGY.

President: ARTHUR H. CHEATLE, C.B.E., F.R.C.S. (London).

Vice-Presidents: NEIL MACLAY, M.B. (Newcastle-upon-Tyne); IRWIN MOORE, M.B., C.M. (London); SYDNEY R. SCOTT, M.S., F.R.C.S. (London).

Honorary Secretaries: H. N. BARNETT, F.R.C.S. (Ed.), 27, The Circus, Bath; R. SCOTT STEVENSON, M.D., 30, New Cavendish Street, London, W.1.

#### The following Sections will meet on Two Days.

##### DISEASES OF CHILDREN.

President: ROBERT HUTCHISON, M.D., F.R.C.P. (London).

Vice-Presidents: CAREY F. COOMES, M.D., F.R.C.P. (Bristol); P. T. CRYMBLE, F.R.C.S. (Belfast); CHARLES McNEIL, M.D., F.R.C.P. (Edinburgh); REGINALD H. MILLER, M.D., F.R.C.P. (London).

Honorary Secretaries: VINCENT COATES, M.C., M.D., 10, The Circus, Bath; R. A. RAMSAY, M.Ch., F.R.C.S., 123, Gloucester Terrace, Hyde Park, London, W.2.

##### OPHTHALMOLOGY.

President: W. MARDON BEAUMONT, M.R.C.S. (Bath).

Vice-Presidents: R. WALLACE HENRY, M.D. (Leicester); A. W. ORMOND, C.B.E., F.R.C.S. (London); C. H. WALKER, F.R.C.S. (Bristol).

Honorary Secretaries: R. COLLEY, M.B., D.O.M.S., 30, The Circus, Bath; P. G. DOYNE, M.B., F.R.C.S., 8, Harley Street, London, W.1.

##### ORTHOPAEDICS.

(One day being combined with Surgery.)

President: Professor E. W. HEY GROVES, M.S., F.R.C.S. (Bristol).

Vice-Presidents: NAUGHTON DUNN, M.B., Ch.B. (Birmingham); G. R. GIRDLESTONE, M.B., F.R.C.S. (Oxford); E. MUIRHEAD LITTLE, F.R.C.S. (London).

Honorary Secretaries: T. TWISTINGTON HIGGINS, O.B.E., F.R.C.S., 27, Harley Street, London, W.1; J. S. LEVIS, M.C., M.B., 20, Gay Street, Bath.

## PUBLIC MEDICINE.

**President:** T. EUSTACE HILL, O.B.E., M.B., D.H. (Durham).  
**Vice-Presidents:** T. W. NAYLOR BAILOW, O.B.E., M.R.C.S.,  
 L.R.C.P. (Wallasey); J. F. BLACKETT, M.D. (Bath); W. A. BREND,  
 M.D. (London); S. NOY SCOTT, M.R.C.S., L.R.C.P. (Plymouth).  
**Honorary Secretaries:** A. NEVILLE COX, M.D., M.R.C.P., 21, Corn-  
 wall Gardens, Preston Park, Brighton; R. E. THOMAS, M.D.,  
 11, Darlington Place, Bath.

*The following Section will meet on One Day.*

## MEDICAL SOCIOLOGY.

**President:** CHARLES E. S. FLEMING, M.R.C.S., L.R.C.P.  
 (Bradford-on-Avon).

**Vice-Presidents:** J. W. BONE, M.B., C.M. (Luton); WILFRED  
 BUCKLEY, C.B.E. (London); G. P. MALE, M.R.C.V.S. (Reading);  
 E. A. STARLING, M.B., M.Ch. (Tunbridge Wells).

**Honorary Secretaries:** C. J. BUCHAN, M.B., 326, Brownhill Road,  
 Catford, London, S.E.6; C. A. MARSH, M.D., The Roseries, English-  
 combe, Bath.

The following have been arranged:  
**Friday, July 17th.** What should be the  
 Standard of Food? by Dr. R. STENHOUSE  
 WILLIAMS (Reading), from the point of view of the bacteriologist;  
 Dr. W. G. SAVAGE (M.O.), from the point of view of the medical officer of  
 health; and Dr. J. H. MAGE  
 What Means can Pure Milk be Obtained, and the Cost? To be  
 opened by Mr. WILFRED BUCKLEY (National Clean Milk Society),  
 as a producer; Mr. J. H. MAGE  
 and Mr. J. H. MAGE  
 Two films will be  
 certified milk on an  
 of milk in New York City.

## THE PATHOLOGICAL MUSEUM.

THE committee responsible for the organization of the  
 Pathological Museum is anxious to secure the co-operation  
 of the officers of the various scientific Sections at the forth-  
 coming Annual Meeting in Bath of the British Medical  
 Association next July. The committee will be glad to take  
 charge of, and place in the museum for exhibition, any  
 specimens, casts, photographs, diagrams, or microscopic  
 slides during the time they are not required by those who  
 are reading papers or taking part in the discussions.  
 Every care will be taken of specimens, and the contents of  
 the museum will be insured.

## PROVISIONAL TIME-TABLE.

**FRIDAY, JULY 17TH.**

10.0 a.m.—Representative Meeting.  
 7.15 p.m.—Representatives' Dinner.

**SATURDAY, JULY 18TH.**

9.30 a.m.—Representative Meeting.  
 8.0 p.m.—Smoking Concert.

**SUNDAY, JULY 19TH.**

10.0 a.m.—Excursion to Cheddar, Glastonbury, and Wells.

 MUMFORD, O.B.E., F.R.C.S. (British Medical Association  
 Committee Rooms, Assembly Rooms, Bath); and the  
 Honorary Assistant Secretary is Dr. R. G. GORDON.

## Meetings of Branches and Divisions.

## BIRMINGHAM BRANCH: NUNEATON AND TAMWORTH DIVISION.

A MEETING of the Nuneaton and Tamworth Division was held in  
 Nuneaton General Hospital on April 1st. Attention was drawn to  
 the Current Note in the SUPPLEMENT of February 23th with refer-  
 ence to life insurance without medical examination. After discussion  
 the following resolution was carried:

"That, in cases where an insurance company accepts a life without  
 medical examination, this Division disapproves of the furnishing of  
 any information to the company after the death of the insured  
 person."

Mr. C. A. RAISSON, F.R.C.S., read a most interesting and com-  
 prehensive paper on the "acute abdomen" in the child. The  
 paper, which was illustrated by charts and pathological specimens,  
 dealt especially with the diagnosis and differential diagnosis of  
 intussusception, acute appendicitis, pneumococcal peritonitis, and  
 intestinal obstruction. After a short discussion a hearty vote of  
 thanks was accorded to Mr. Raison for his valuable paper.

## SURREY BRANCH: CROYDON DIVISION.

A MEETING of the Croydon Division was held at the Croydon General  
 Hospital on March 31st, when Dr. F. G. SWAYNE was in the chair.  
 A letter was read from Dr. A. D. Macpherson, Assistant Medical  
 Secretary, congratulating the Division on the increase of member-  
 ship and pointing out that the Division was now eligible to appoint  
 two members to the Representative Body. The Representative,  
 Dr. C. G. C. SCUDAMORE, and the Representative of the Local  
 Medical and Panel Committees, Dr. G. G. GERRARD, reported on the  
 proceedings of the combined meeting of the Representative Body  
 of the British Medical Association and the Panel Conference, held  
 at the Central Hall, Westminster, on March 12th. The Honorary  
 Secretary was instructed to make arrangements for the annual  
 dinner to be held on April 17th.

In the absence of Dr. H. W. Barber, owing to illness, Dr. H. C.  
 SMOX attended and gave an address on the causes, symptoms, and  
 treatment of some common skin diseases—impetigo, contagiosa  
 pediculi, scabies, eczema of feet, pityriasis sicca, pruritus  
 ani. A discussion followed, in which Drs. RICHMOND, GERRARD, J. W.  
 WATTS, PINKERTON, REYNOLDS, and BROOK took part. On the pro-  
 position of Dr. PINKERTON, seconded by Dr. WATTS, a vote of thanks  
 to Dr. Semon for coming at such short notice and giving such a  
 valuable, instructive, and interesting address was carried with  
 acclamation.

## National Insurance.

## THE ROYAL COMMISSION.

THE twenty-fourth meeting of the Royal Commission on  
 National Health Insurance was held at the Home Office on  
 April 2nd, Sir Andrew Duncan in the chair. Evidence was  
 given on behalf of the National Federation of Employees'  
 Approved Societies by Mr. Henry Lesser, president of the  
 federation. Sir Thomas M. Legge, M.D., of the Home Office,  
 senior medical inspector of factories, gave evidence on the  
 medical work in factories and workshops, and suggested possi-  
 bilities of development in that work. Mr. V. L. Bilbey, the clerk  
 in charge of the Ministry of Health inquiry room, was examined  
 as to the volume and nature of the inquiries and complaints  
 made by employers and insured persons.

Proof copies of the oral evidence and the relative statements  
 submitted at the meeting of March 19th may be obtained from  
 H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2,  
 on remittance of cost (4s. 6d.) and postage.

## NATIONAL INSURANCE INQUIRIES.

## CHARGES OF SLACKNESS.

A REPORT has been received from the Ministry of Health  
 dealing with an inquiry held at Burton-on-Trent on January  
 21st under the Medical Benefit Regulations, on a representation  
 by the Burton Insurance Committee that the continuance of  
 Dr. V on the medical list would be prejudicial to the efficiency  
 of the medical service of the insured.

Both the complainants and the respondent were legally repre-  
 sented, and the Insurance Committee called a number of witnesses,  
 who gave their evidence on oath, while the respondent gave  
 evidence on oath on his own behalf, but called no witnesses. It  
 appeared that the respondent has been on the panel list since its  
 inception and has over 2,000 persons on his list. He resides  
 between half and three-quarters of a mile from his surgery, and  
 one of the charges made was that on numerous occasions he had  
 not attended at his surgery at the arranged hours, 9 a.m. to  
 10 a.m., and had failed to provide for any medical substitute or  
 to notify the Insurance Committee, and as a result patients had  
 often waited for an hour or more and had to go away without  
 seeing him. Dr. V admitted this charge, but pleaded in extenu-  
 ation that he suffered from a dilated heart and angina pectoris,  
 that owing to this he had been off work altogether for eleven  
 weeks in early 1924, during which he had a "sacred" period,  
 and since then he often had attacks coming on suddenly and prevent-  
 ing his attendance at his surgery. Moreover, he said that on  
 certain occasions he had sent his chauffeur to the surgery to inform  
 any waiting patients that he was unable to attend at the surgery  
 but might be seen at his residence. Evidence was given that this

had been done, but generally not until about 10 a.m. The Inquiry Committee accepted Dr. V's evidence that on certain occasions he had not been fit to attend at the surgery, but on other occasions, the Committee thought, his late arrival at the surgery must be ascribed to slackness, and that, having regard to his condition, he should have made some arrangement in advance to ensure that his patients would be properly treated if he should be prevented by a heart attack from going to his surgery.

In the case of a woman patient evidence was given that the respondent had been asked to visit her at her home and had failed to call, though he had given the messenger medicine for her, and as he did not call another doctor had had to be called in. Dr. V said he had no recollection of being asked to visit, but the Inquiry Committee was satisfied that he had been asked and had neglected to call, and this charge was held to have been established. At the same time the Committee thought that the respondent's illness should be taken into account in extenuation, and that his neglect should be ascribed to forgetfulness rather than to wilfulness.

The third charge was that he had failed to treat properly a man whose hand had been injured in an accident. The charge of neglect in treatment was held to be not established, but a further charge in the same case, that Dr. V had deliberately antedated a certificate, was held to be established.

A fifth charge was that on February 20th Dr. V had been asked to call on a patient and had failed to do so. He stated that he had no recollection of being asked to visit; the messenger did not attend at the Inquiry, and the charge was held to be not established. But it appears that the patient in question, later, on February 25th, himself went to see the respondent at his surgery, and though Dr. V had not seen him on February 20th he gave him a certificate on which February 20th was entered as the date of examination and the date of signing the certificate. The Inquiry Committee could not accept the respondent's plea that this was done inadvertently, but considered that the antedating was done deliberately, and this charge was regarded as established.

A further charge was that Dr. V had accepted for treatment a number of temporary residents, but had failed to supply the Insurance Committee with the necessary record of treatment rendered, and further, that he had taken no notice of letters from the Insurance Committee asking for such records. The Inquiry Committee could not accept the excuse put forward that he did not understand the matter and had let it drift, hoping to see the clerk of the Insurance Committee. This charge was accordingly held to be established and respondent's behaviour was held to be "due to gross slackness."

A somewhat similar charge related to failure to send in the necessary reports about three tuberculosis cases, and neglect to reply to letters from the tuberculosis officer and the regional medical officer asking for such reports. The Inquiry Committee held this also to be established, and the respondent's behaviour to be "due to gross slackness."

It was also established that Dr. V had unduly delayed the sending in of his medical record cards, though he had improved in this respect recently. He had, however, persisted in allowing a clerk to sign his "acceptances" though he had been warned that the regulations required him to sign "acceptances" personally.

In summing up, the Inquiry Committee found that the respondent had been persistently and seriously slack in the observance of his terms of service. He expressed his regret for the inconvenience he had caused to the Insurance Committee and his patients, and ascribed his faults to his ill health, and that later, when he found he was in bad odour with the Insurance Committee, he had lacked the courage to grapple with the situation and had let matters drift. The Inquiry Committee could only accept ill health as a palliation to a very small extent, and thought that "the root of the trouble was an ingrained habit of slackness and procrastination." In the circumstances the Committee recommended that he should pay the costs of the Insurance Committee incidental to the inquiry.

As the result of the inquiry the Minister of Health has decided not to remove Dr. V's name from the medical list, but that in addition to paying the costs of the Insurance Committee the sum of £100 is to be deducted from his remuneration; and he is warned that if any further representations as to failure on his part to comply with his obligations are established the Minister would have no option but to remove his name from the list.

## Correspondence.

### Certification Rules.

SIR,—In the SUPPLEMENT of April 4th the Proceedings of Council are reported, and in that necessarily abridged report Dr. Braekenburg is represented as saying: "The Barnstaple Division . . . had put up a series of amendments which would have resulted in changing what might possibly be under-emphasis in the original document into overemphasis, with some inaccuracy of statement."

The question of under-emphasis or over-emphasis is a matter of individual opinion. Dr. Braekenburg's opinion is, of course, bound to carry very great weight. Judging, however, from the attitude of the members of the Conference present when this matter was discussed, the view here expressed would not be endorsed by the majority of that Conference.

With regard to the last part of the sentence quoted, "inaccuracy of statement" is a very different matter, and some further explanation is desirable. Every member of the Conference had a printed copy of the amendments supplied him. In spite of that fact, no one questioned the accuracy of any amendments or of any statement made in their support. It is suggested that the Barnstaple Division has a right to ask for a letter in next week's JOURNAL from a member of the Council showing wherein their amendments were deserving of this criticism.

Perhaps they are the more entitled to ask this, since, if correctly reported, Dr. Braekenburg is himself guilty of "inaccuracy of statement" two lines lower down, when he speaks of meeting the "Barnstaple position." Surely when the Conference refers a resolution to the Council that resolution ceases to be a local (Barnstaple) question, but now becomes a question which affects the whole community.—I am, etc.,

Barnstaple, April 5th.

HERBERT C. JONAS.

### Checking Panel Lists.

SIR,—The Insurance Act authorities would appear to be trying to trace each separate member on the panel lists of doctors. Their method seems to be to write a letter to each member. If no answer be forthcoming, the person in question is taken to be non-existent, and the corresponding envelope-record-card is recalled.

In the case of myself this has happened. But this method is hardly satisfactory; in about one case in twelve it is wholly unmiss. For letters in this proportion were sent out, and when no answer was returned by the post their record envelopes were demanded back. But it happened that to my knowledge such persons were still living at the addresses written to. But such a high percentage of error will amount up to very big proportions when applied to some 15,000,000 insured persons. Also, it is hardly fair to the individual member—or to the doctor.—I am, etc.,

April 4th.

M.A. OXON.

## Naval and Military Appointments.

### ROYAL NAVAL MEDICAL SERVICE.

SURGEON COMMANDERS M. T. Hale to the *Royal Oak*; G. Nuna, O.B.E., and G. A. S. Hamilton to the *Victory*, for R.N. Barracks, Portsmouth; J. H. McDowell to the *Fidra*, for R.N. Barracks, Devonport; B. R. Bickford, D.S.O., to the *Families*; J. H. D. Martin to the *Vindictive*, on commissioning; H. E. Scargill to the *Pembroke*, for R.N. Hospital, Chatham.

SURGEON LIEUTENANT COMMANDERS W. G. Thwaites to the *Fidra*, for R.N. Barracks, Devonport, temporary; F. J. D. Twigg to the *Iron Duke*; J. F. Pao to the *Renege*; J. E. Ainley to the *Vindictive*, on commissioning.

SURGEON LIEUTENANTS W. J. McB. Allan to the *Columbine*, additional for Naval Base, Port Edgar; R. B. McVicker to the *Families*; R. G. Anthony to the *Cockchafer*; J. H. B. Crobie to the *Fidra*, for R.N. Infirmary, Plymouth; L. McGuck to the *Vindictive*, supernumerary on arrival of *Vindictive* on station; J. B. Horan to the *Greenrich*; R. L. G. Proctor to the *Renege*; A. H. Harkins to the *Columbine*, for R.N. Hospital, Portsmouth.

SURGEON LIEUTENANTS H. B. Parker, D.S.C., and J. L. Preston have been . . . . . Surgeon Commander.

### ARMY MEDICAL DEPARTMENT.

Colonel T. C. MacKenzie, D.S.O., R.A.M.C.(ret.), has been temporarily appointed Deputy Assistant Director-General at the War Office, vice Lieut.-Colonel E. C. Montgomery-Smith, C.M.G., D.S.O., R.A.M.C.(T.A.), vacated.

### INDIAN MEDICAL SERVICE.

Colonel A. W. R. Cochrane, Inspector-General of Civil Hospitals, United Provinces, is granted leave on average pay for three months. Lieut.-Colonel G. Hutchison is appointed to officiate as Inspector-General of Civil Hospitals, United Provinces, during Colonel Cochrane's absence on leave.

The services of Lieut.-Colonel F. W. Sumner, Civil Surgeon, Simla (East), are replaced at the disposal of the Government of the United Provinces.

Lieut.-Colonel J. M. A. Macmillan is appointed to be Civil Surgeon, Simla (East).

Major W. S. Nelson to be Lieutenant-Colonel.

Major G. M. Millar, O.B.E., an Agency Surgeon, is granted combined leave for one year.

### TERRITORIAL ARMY.

#### ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel (Breret Colonel) C. R. White, D.S.O., T.D., from R.A.M.G.(T.A.), to be Colonel, with precedence as from February 16th, 1924, and Assistant Director of Medical Services, 53rd (Welsh) Division, vice Colonel H. T. Samuel, D.S.O., T.D., vacated on completion of tenure of appointment.

Major F. T. Rces, M.C., to be Lieut.-Colonel, and to command 53rd (3rd Western) Casualty Clearing Station.

Captain A. A. Finnigan (late unattached list, O.T.C.) to be Lieutenant, with precedence as from June 1st, 1924, and relinquishes the rank of Captain.

Lieutenant E. B. Murrell (late R.F.A., S.R.) to be Lieutenant. A. M. Robertson to be Lieutenant, with precedence as from September 5th, 1924.

## VACANCIES.

- BURNSLEY:** BECKETT HOSPITAL AND DISPENSARY.—(1) House-Physician. (2) Junior House-Surgeon. Salary at the rate of £140 per annum each.
- BELFAST:** ULSTER HOSPITAL FOR CHILDREN AND WOMEN.—Honorary Assistant Surgeon to the Children's Department.
- BIRMINGHAM:** QUEEN'S HOSPITAL.—(1) Resident Anaesthetist. (2) Clinical Assistant in the Out-patient Department of the Birmingham and Midland Hospital for Diseases of the Nervous System. Honorarium for (1) £70 to £100 per annum and for (2) £50 per annum.
- BIRMINGHAM UNION:** Resident Assistant Medical Officer (junior) at the Selly Oak Hospital. Salary £300 per annum, rising to £400.
- BRIGHTON:** NEW SUSSEX HOSPITAL.—Honorary Assistant Anaesthetist.
- BRISTOL CITY AND COUNTY:** Resident Medical Superintendent for the Southmead Hospital. Salary £650 per annum, rising to £800.
- CARDIFF:** PRINCE OF WALES'S HOSPITAL FOR CRURALS AND LIMBS.—Resident House-Surgeon.
- CHESTER:** CITY AND COUNTY OF THE CITY OF CHESTER.—Assistant Medical Officer of Health. Salary £600 per annum.
- CHORLEY HOSPITAL:** House-Surgeon (male). Salary £150 per annum.
- COUNTY MENTAL HOSPITAL:** Mickleover, near Derby.—Junior Assistant Medical Officer (male). Salary £350 per annum, rising to £450, and £50 extra for D.P.M.
- CROYDON COUNTY BOROUGH:** Deputy Medical Officer of Health and Deputy School Medical Officer. Salary £780 per annum.
- DORSET COUNTY HOSPITAL:** Dorchester.—Honorary Dental Surgeon.
- EGYPTIAN GOVERNMENT:** Assistant Professor of Chemistry at the Cairo School of Medicine. Initial salary of ££720 a year in a class ££720-£50.
- FRENCH HOSPITAL AND DISPENSARY:** 172, Shaftesbury Avenue, W.C.2.—Radiographer.
- HARTLEPOOL HOSPITAL:** House-Surgeon (male). Salary at the rate of £150 per annum.
- LONDON LOCK HOSPITAL:** 91, Dean Street, W.1.—House-Surgeon at the Male Lock Hospital. Salary at the rate of £200 per annum.
- LONDON TEMPERANCE HOSPITAL:** Hampstead Road, N.W.1.—Surgical Registrar. Honorarium 40 guineas.
- MANCHESTER ROYAL INFIRMARY:**—(1) Assistant Resident Surgical Officer; salary at the rate of £150 per annum. (2) House-Surgeon (male) for the Aural, Gynaecological, and Ophthalmic Departments, salary at the rate of £50 per annum.
- METROPOLITAN ASYLUMS BOARD:** Assistant Medical Officer in the Children's Service at the Downs Hospital for Children, Sutton. Salary £550, rising to £600.
- METROPOLITAN HOSPITAL:** Kingsland Road, E.8.—(1) Surgeon for Diseases of the Nose, Throat, and Ear. (2) Senior House-Physician. (3) Senior House-Surgeon. (4) Junior House-Physician. (5) Junior House-Surgeon. (6) Two Casualty Officers. Salary (2)-(5) £100 per annum.
- MIDDLEBROUGH:** NORTH GOMESAY HOSPITAL.—Resident Surgical Officer (male). Salary £150 per annum.

Every Member is requested to preserve this "Supplement," which contains matters specially referred to Divisions, until the subjects have been discussed by the Division to which he or she belongs.

### Correspondence.

#### *The Liberties of the Profession.*

SIR,—I think it can hardly be doubted that, if the Joint Conference could meet again, the motion of the Cheshire Panel Committee (SUPPLEMENT, March 21st, p. 116) would be passed by a substantial majority.<sup>1</sup> As one of those who voted in favour of that motion, and being much fortified in my opinion by recent events, I would plead for its reconsideration.

First, neither the diphtheria case, nor another within my experience where a fine of £5 was inflicted for an offence so trivial that the complaining society, who had been misinformed by their sick visitor, desired to withdraw it, would seem to come within the ambit of the resolution actually passed. In the first instance, the essence of the case is that no offence was committed, and, in the second, it has been pleaded that £5 is the minimum fine.

Next, the fear of appeals to the courts by other parties daunts no not at all. The opportunity to give evidence on oath, and submit to really skilled cross-examination, would not, I think, entice such complainants as I have met. On the contrary, the possibility of such event would, I think, be a most useful deterrent to officious busybodies and overzealous sick visitors. In any case, the notion that we have the least reason to fear competition in the courts seems to me a most dangerous one to promote. As to the legal position, I hesitate to criticize Dr. Brackenbury, but, after study of the evidence given before the Royal Commission, I submit that neither the power to remove from the panel, nor that to inflict fines, rests in any way upon constitutional usage. The first is derived exclusively from Section 15 (2) of the Act of 1911, defining the powers of the Commissioners; the second depends entirely upon the conditions as to adequacy of service attached to the Exchequer grant of 2s. 6d. These conditions implied that the added pay was too much for the service demanded, and were in the nature of a punishment for the resistance of the doctors to the Act. Societies did not resist, because they had already privately exacted such terms that they could not possibly demand more. They included complete mastery over doctors, the perpetuation of the worst abuse of the old club system, very generous remuneration, and a free gift of between 10 and 20 million pounds! Differential treatment against the doctors was therefore iniquitous even then, and the

last excuses for its continuance were completely removed with the arbitration award of 1920, and the departmental decision of 1921, which, after adequate experience of the work of both, settled the allowance of doctors and societies respectively, and with the final disappearance, first of the 2s. 6d. Exchequer grant, and then of the supplementary grant, in the Act of 1924.

It seems to me that, as I have already stated elsewhere, we have excellent reason to dispute the autoeracy of the Minister on the first count, on the grounds that Parliament did not contemplate his investiture with such powers, and as regards the second, to claim either that the whole system of fines be abandoned, or that it be applied equitably to society officers and doctors alike. In these circumstances the proposal of Cheshire seems to me a very mild and entirely excellent one, which should be embodied in our evidence before the Royal Commission. It would very rarely come into operation, but be an invaluable safeguard. —I am, etc.,

Cluchester, April 5th.

G. C. GARRATT.

### Meetings of Branches and Divisions.

#### BIRMINGHAM BRANCH: WEST BROMWICH DIVISION.

The second regular meeting of the West Bromwich Division was held on April 1st. Mr. HERBERT POTTER, F.R.M.S., gave a most interesting address on marine zoology, and showed many beautiful slides. The formation of a local Hospitals Committee was considered; this matter will be dealt with in conjunction with the staff of the West Bromwich and District Hospital.

#### SUFFOLK BRANCH: WEST SUFFOLK DIVISION.

The annual general meeting of the West Suffolk Division was held at the West Suffolk General Hospital, Bury St. Edmunds, on March 31st.

The SECRETARY announced the result of the Treasurer's Golf Cup Competition, in which Dr. H. G. Kilner was the winner. The annual report and balance sheet were received and adopted.

A vote of thanks to Dr. WOOD for his hospitality last summer was, on the motion of the CHAIRMAN, carried unanimously.

The following officers were elected for the ensuing year:

Chairman, Dr. R. W. Rix. Vice-Chairman, Dr. T. H. Goodman. Secretary and Treasurer, Dr. B. E. A. Batt. Representative in Representative Body, Dr. O. R. M. Wood. Deputy Representative, Dr. J. D. Batt.

The Golf Competition Subcommittee was re-elected as follows: Dr. F. R. Barwell, Dr. B. E. A. Batt, Dr. W. F. Bennett, Dr. C. Tylor.

Dr. H. A. Lucas read an interesting paper on the value of laboratory investigations in general practice. He discussed principally blood examinations, cerebro-spinal fluid, and test meals. The paper dealt entirely with practical points, and was received with very great interest. It was followed by a discussion, in which several members took part, and an exhibition of microscope slides.

On the motion of the Chairman, Dr. R. W. Rix, seconded by Dr. HINZELL, a vote of thanks to Dr. Lucas was carried with acclamation.

<sup>1</sup> The Cheshire motion had reference to the procedure for dealing with complaints. It ran: "That paragraph 40 (4) be so altered that no appeal may be made not only with the object of mitigation of penalty, but on the merits of the case." It was lost by 79 to 65 votes.

MATTERS REFERRED TO DIVISIONS.

Having examined the Balance Sheet, dated 31st December, 1924, and Accounts with the books and vouchers of the Association, except as regards the Irish Committee and Scottish Committee Accounts, and having received all the information and explanations we have required, we report that the Balance Sheet is, in our opinion, properly drawn up so as to exhibit a true and correct view of the state of the affairs of the Association according to the best of our information and the explanations given to us and as shown by the books of the Association.

We have inspected the lease of the New Building and have verified the Investments of the Association on General Account, on Account of the Trust Funds and of the Office Staff Superannuation Fund, and have further ascertained that the Deeds of the Freehold Property, 429, Strand, Agar Street, and Harvey's Buildings, are held by the Westminster Bank, Limited, as security for the sum advanced.

N. BISHOP HARMAN, F.R.C.S.,  
Treasurer.

L. FERRIS-SCOTT, F.C.A.,  
Financial Secretary and Business Manager.

PRICE, WATERHOUSE & CO.,

3, Frederick's Place, Old Jewry, London, E.C.

9th March, 1925.

## Association Notices.

### BRANCH AND DIVISION MEETINGS TO BE HELD.

**BOADER COUNTIES BRANCH: DUMFRIES AND GALLOWAY DIVISION.**—The annual meeting of the Dumfries and Galloway Division will be held in the Royal Infirmary, Dumfries, on Thursday, May 21st, at 3.30 p.m. Professor B. P. Watson, M.D. (Edinburgh University), will deliver a British Medical Association Lecture on the treatment of abortion.

**CAPE OF GOOD HOPE (WESTERN) BRANCH.—Clinical Programme.**—The Cape of Good Hope (Western) Branch has arranged a good clinical programme for the session 1925; it includes a series of discussions and papers on practical subjects. At the meeting at Paarl on March 13th and 14th there was a discussion on osteomyelitis, followed the next day by demonstrations in the Paarl Hospital. At the meeting on March 27th papers were read by Mr. D. J. Wood on Hess's method of diagnosing paralysis of the ocular muscles, by Dr. J. P. Duncan on bronchitis, and by Mr. W. Lennox Gordon on peritonitis. A meeting will be held on April 24th, when Dr. G. W. Bamfylde Daniell will read a paper on the effect of high altitudes on general anaesthesia, Dr. O. M. Gericke will speak on "Lieb," and Dr. C. M. Murray on some cases treated by suggestion. A discussion on asthma will take place at the meeting on May 29th, when the speakers will include Professor W. Campbell, Professor J. W. C. Gunn, Mr. C. E. Jones-Phillipson, and Dr. P. W. J. Keet. Further meetings have been arranged for June 26th, August 23rd, September 25th, and October 30th, the annual meeting taking place on November 27th.

**ESSEX BRANCH: SOUTH ESSEX DIVISION.**—A meeting of the South Essex Division will be held at the High School for Boys, Victoria Circus, Southend-on-Sea, on Tuesday, April 21st, at 8.15 p.m., when Sir Arthur Newsholme, K.C.B., late Principal Medical Officer to the Local Government Board, will give an address on liberty and health.

**LANCASHIRE AND CHESHIRE BRANCH: ROCHDALE DIVISION.**—The annual meeting of the Rochdale Division will be held in the Wellington Hotel, Drake Street, Rochdale, on Wednesday, April 29th, at 8.30 p.m. Business: Annual statement for 1924; election of Representative, Deputy Representative, officers, and Executive Committee for the ensuing year.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, E.8, on Tuesday April 21st, at 9.30 p.m., when Professor Hugh Maclean, D.Sc., M.D., M.R.C.P., Director of Medical Unit, St. Thomas's Hospital, will read a paper entitled "Diabetes—its treatment: insulin up to date." A Divisional dinner and fancy dress dance and carnival—fancy dress optional (four prizes)—will be held at the Holborn Restaurant on Thursday, April 30th, from 7.30 p.m. to 2 a.m.; bridge. Refreshments during evening. Tickets 15s.; early application will be greatly appreciated by Dr. Ernest A. Worley (honorary secretary), 43, De Beauvoir Road, N.1.

**METROPOLITAN COUNTIES BRANCH: HENDON DIVISION.**—The inaugural meeting of the Hendon Division will take place at the Refectory, facing Golders Green Station, N.W., on Thursday, April 23rd, at 8.30 p.m., when local members of the profession, in addition to members of the Division, are invited. Light refreshment will be served.

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—A general meeting of the Kensington Division will be held on Thursday, April 23rd, at the Kensington Palace Mansions Hotel, De Vere Gardens, W.8, at 8.45 p.m. An address will be given by Dr. Seymour Taylor, consulting physician to the West London Hospital, entitled "Some medical aphorisms."

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.**—A meeting of the Lewisham Division will be held at the Parish Room, St. Laurence Vicarage, Bromley Road, Catford, S.E.6, on Tuesday, April 21st, at 8.45 p.m., when Dr. F. A. Beattie will preside. Agenda: Mr. G. Gordon-Taylor, O.B.E., M.S., F.R.C.S.: Haemorrhages in connection with gastric and duodenal ulcers; election of Representative and Deputy Representative of the Division for the Annual Meeting at Bath; to receive report from Dr. Charsley on motion before Branch Council; any other business.

**METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISION.**—The annual general meeting of the Westminster and Holborn Division will be held at the Criterion Restaurant on Thursday, May 7th, at 8.30 p.m. After the business a paper will be read by Sir William J. Collins, K.C.V.O., M.D., F.R.C.S., entitled "The control of the traffic in drugs of addiction." The meeting will be preceded by dinner at 7.30, the price of which (5s.) should be paid to the Secretary at the table. A large attendance is hoped for.

**METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.**—A meeting of the Willesden Division will be held at the Willesden General Hospital, Harlesden Road, on Wednesday, April 22nd, at 9 p.m. Agenda: Election of Representative and Deputy Representative in the Representative Body; Annual Report of Council (published in the SUPPLEMENT of April 11th, 1925).

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—At the meeting of the Chesterfield Division, to be held at the Maternity Hospital, Chesterfield, to-day (Friday, April 17th), at 8.30 p.m., Mr. A. M. Connell, Professor of Surgery in the University of Sheffield, will give an address on injuries to the lower extremity.

**NORTH OF ENGLAND BRANCH.**—The annual dinner of the North of England Branch will be held in the Medical Institute, 7, Windsor Terrace, Newcastle-upon-Tyne, on Thursday, April 23rd, at

7.30 p.m. This is the first dinner to be held for several years, and it is hoped that as many members as possible will attend. Early application for tickets will be appreciated by Mr. Norman Hodgson (Branch Secretary), 7, Windsor Terrace, Newcastle.

**NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.**—A scientific meeting of the Sunderland Division will be held at the Mental Hospital, Ryhope, on Wednesday, May 27th, at 3.30 p.m. All members of the Division are invited to be present.

**NORTH WALES BRANCH.**—The spring meeting of the North Wales Branch will be held at Rhyl on Tuesday, April 28th.

**SOUTH-WESTERN BRANCH.**—An intermediate meeting of the South-Western Branch will be held at Barnstaple on Thursday, May 7th. The agenda paper will be circulated in due course.

**SOUTHERN BRANCH: WINCHESTER DIVISION.**—A meeting of the Winchester Division will be held at Lord Mayor Treloar Cripples' Hospital and College, Alton, on April 23rd, at 3 p.m., when the wards will be open for inspection, and the various kinds of treatment, etc., in use explained. Sir Henry Gauvain has kindly invited members to tea at the conclusion of the meeting. It will be a great convenience if members who intend to be present will notify the honorary secretary (Dr. W. A. Bruce Young, Everthorpe, East Hill, Winchester) a few days before the meeting.

**SURREY BRANCH: CROYDON DIVISION.**—The annual dinner of the Croydon Division will be held at the Greyhound Hotel, Croydon, to-day (Friday, April 17th), at 8 p.m.

**SURREY BRANCH: GUILDFORD DIVISION.**—A meeting of the Guildford Division will be held at the Royal Surrey County Hospital, Guildford, on Thursday, April 23rd, at 4 p.m., when Mr. Dudley Buxton will read a paper on the treatment of common disabilities of the feet. Tea will be served at 3.45 p.m.

**YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.**—A meeting of the Wakefield, Pontefract, and Castleford Division will be held at the Bull Restaurant, Westgate, Wakefield, on Thursday, April 23rd, at 8.30 p.m., when Mr. J. F. Dobson, F.R.C.S. (Leeds), will read a paper on urological diagnosis (illustrated with lantern slides). Supper at 8 o'clock.

At the recent election to the Willesden Urban District Council Dr. G. W. R. Skene, chairman of the Public Health Committee, was returned at the head of the poll in his ward. Dr. Skene is deputy representative of the Willesden Division in the Representative Body of the British Medical Association, and was chairman of the Division in 1923. Dr. William Lock; the other medical candidate, was unsuccessful.

### DIARY OF SOCIETIES AND LECTURES.

**ROYAL SOCIETY OF MEDICINE.**  
Section of Therapeutics and Pharmacology. Tues., 4.30 p.m., Annual General Meeting. Election of Officers and Council for 1925-26.  
General Meeting of Fellows: Tues., 5.30 p.m., Ballot for Fellowship.  
Section of Epidemiology and State Medicine: Thurs., 5.30 p.m., Dr. Monckton Copeman: Immunization against Scarlet Fever.  
Section of Urology: Thurs., 8.30 p.m., Discussion: Bacterial Infections of the Urinary Tract. Openers: Professor Leonard S. Dudgeon (Pathological), Dr. E. Lepper (Experimental), Sir John Thomson-Walker (Diagnosis and Treatment).  
Section of Study of Disease in Children: Fri., 8.30 p.m., Discussion: Is the Modification of Cow's Milk necessary in Infant Feeding? Openers: Dr. Leonard Findlay, Eric Pritchard, Hugh Thursfield, and R. C. Jewsbury.

**MEDICO-LEGAL SOCIETY**, 11, Chandos Street, W.1.—Tues., 8.30 p.m., Lord Riddell: The Legal Responsibility of the Surgeon; followed by a Discussion.

**FIFTH BRITISH CONGRESS OF OBSTETRICS AND GYNAECOLOGY**, 1, Wimpole Street, W.1.  
Wed., 10.30 to 1 p.m., Reports: Prognosis and Treatment of Puerperal Sepsis. Papers, 1.15 p.m., Luncheon at Pagan's Restaurant, Great Portland Street, W.1. 2.30 to 5 p.m., Discussion: Puerperal Sepsis; to be opened by Professor J. Whitridge Williams. 9 p.m., Reception by the President and Mrs. Russell Andrews.  
Thurs., 10 a.m., Business Meeting. 10.30 a.m. to 1 p.m., Papers, 2.30 to 5 p.m., Papers, 8 p.m., Congress Dinner at Criterion Restaurant.  
Fri., 10 a.m. to 1 p.m., Papers with Epidiascope Demonstrations. Afternoon: Operations at principal hospitals.

### POST-GRADUATE COURSES AND LECTURES.

**CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL**, Gray's Inn Road, W.C.1.—Fri., 4 p.m., Dysphagia.

**WEST LONDON HOSPITAL**, Putney, S.W.15.—Thurs., 7 p.m., Mon., 12 noon, Applied Anatomy. Cases. Wed., 2 p.m., Medical Wards. Department. Fri., 7 p.m., Department. Fri.,

2 p.m., Throat, Nose, and Ear Department. Sat., 10 a.m., Medical Diseases of Children. Daily 10 a.m. to 6 p.m., Sat. 10 a.m. to 1 p.m., In- and Out-patients, Operations, Special Departments.

**BIRMINGHAM UNIVERSITY**.—At General Hospital: Tues., 3.30 to 5 p.m., Demonstration of Skin Diseases.

**GLASGOW POST-GRADUATE MEDICAL ASSOCIATION**.—At Royal Mental Hospital, Gartnavel: Wed., 4.15 p.m., Mental Cases.

**MANCHESTER ROYAL INFIRMARY**.—Tues., 4.15 p.m., Illium Tuberculosis. Fri., 4.15 p.m., Medical and Surgical Cases.

### British Medical Association.

OFFICES AND LIBRARY, 112, STRAND, LONDON, W.C.A.

#### Reference and Lending Library.

The Reading Room, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

**LENDING LIBRARY:** Members are entitled to borrow books, including current medical works; they will be forwarded if desired, on application to the Librarian, accompanied by 6d. for each volume for postage and packing.

#### Departments.

**SUBSCRIPTIONS AND ADVERTISEMENTS** (Financial Secretary and Business Manager). Telegrams: Articulate Westrand, London.

**MEDICAL SECRETARY** (Telegrams: Medisecra Westrand, London).

**EDITOR, British Medical Journal** (Telegrams: Athology Westrand, London).

Telephone number for all departments: Gerrard 2530 (5 lines).

**SCOTTISH MEDICAL SOCIETY**, 5, Rutland Square, Edinburgh. (Telegrams: 4361 Central).

**IRISH MEDICAL SOCIETY**, 47, Frederick Street, Dublin. (Telegrams: 4737 Dublin).

#### Diary of the Association.

- APRIL.**
- 17 Fri. London: Foods and Drugs (Advertisements) Subcommittee, 3 p.m.

### British Medical Association.

#### CURRENT NOTES.

##### Royal Commission on National Health Insurance.

THE witnesses on behalf of the British Medical Association, Drs. Bolam, Brackenbury, Dain, and the Medical Secretary (together with any others it may be thought desirable to call in to assist on special points), will be heard by the Royal Commission on National Health Insurance on Thursdays, April 30th and May 7th. The meetings of the Royal Commission are not open to the public, but it is hoped to publish the oral evidence of the Association's witnesses in the SUPPLEMENTS to the BRITISH MEDICAL JOURNAL of May 23rd and 30th. The revised draft of the Association's Memorandum of Evidence appeared in the SUPPLEMENT of February 28th (pp. 69-78).

##### Flags for the Great Hall.

As already intimated, the Council of the Association has asked the Divisions or Branches concerned to consider the presentation of a flag to hang in the Great Hall of the new British Medical Association House from every place at which an Annual Meeting of the Association has been held. The flags are intended to serve a threefold purpose: they will help the acoustic properties of the Hall; they will beautify it; and they will serve as mementoes of occasions to which the Association generally, and the members in the particular areas, look back with pride and satisfaction. It is hoped that each of the niches which have been left for the purpose will be filled on the opening day, which is fixed for the week beginning July 13th; already flags have been promised from London, Carlisle, Bournemouth, and Sheffield.

##### Highlands and Islands Medical Service: A Warning.

The operation of the Highlands' and Islands' Medical Service Act has done much to ameliorate the conditions of practice in that area and to remedy many of the abuses which formerly existed. The Act is administered by the Scottish Board of Health, and a large part of the funds provided by the Act for the improvement of medical service in the Highlands and Islands is distributed by way of grants to practitioners in supplement of the income derived from private practice and parish and other appointments. In addition to the financial improvement a great gain has been the security of tenure for parish medical officers, whose appointments cannot be terminated without the consent of the Board of Health. The Highlands' and Islands' Subcommittee of the Association has had occasion to report favourably on the sympathetic manner in which the Act has been administered and to comment on the general improvement which has resulted in the conditions of practice. Unfortunately, however, the good work is in danger of being nullified in some instances by the action of local lay bodies; and it becomes again necessary to warn practitioners

not to apply for appointments in the Highlands without first communicating with the Scottish Medical Secretary (Dr. J. R. Drever, 6, Rutland Square, Edinburgh). The warning applies specifically to an appointment advertised in the lay press by the Canisbay Medical Association. The present medical officer has held the appointment, as well as that of parish medical officer, for a number of years, and according to all accounts has done very good work. For some reason, which is not evident, he has incurred the displeasure of the Canisbay Medical Association and has been summarily dismissed from his appointment and warned out of his house, which is the property of the association and which is the only available house in the parish. An attempt is also being made to terminate his parish appointment, but the consent of the Board of Health is hardly likely to be obtained in the absence of any satisfactory reason for dismissal. The local Division of the British Medical Association and the Highlands' and Islands' Subcommittee have expressed their sympathy with the doctor and their strong disapproval of the tyrannical conduct of the lay medical association. They hope that this publication of the facts will be sufficient to deter practitioners from making application for the "vacancy."

##### Association Prizes for Essays by Medical Students.

The Council of the British Medical Association in October last gave notice that it was prepared to award prizes of £10 each for essays by final-year medical students on the diagnosis and treatment of chronic intestinal obstruction, with illustrative cases. The essays received have been examined by the following members of the Association: The Right Hon. Lord Dawson of Penn, G.C.V.O., K.C.M.G., C.B. (London); Mr. W. F. Haslam, F.R.C.S. (Birmingham); Dr. W. E. Hume, C.M.G., F.R.C.P. (Newcastle-on-Tyne); Mr. H. Wade, C.M.G., D.S.O., F.R.C.S. (Edinburgh). In accordance with the Examiners' awards, prizes—a cheque for £10 in each case, except in respect of the Durham, Leeds, and Sheffield group of medical schools, where there was a tie, in which case there will be two prizes of £5 each—will in due course be given to the following:

Mr. H. AWROUNIN, Charing Cross Hospital Medical School.  
Mr. F. R. CURTIS, Leeds University.  
Mr. L. HARTSTEN, London Hospital Medical College.  
Mr. J. STEWART HENDRIE, Edinburgh University.  
Mr. R. L. HOLT, Manchester University.  
Mr. F. F. IMIANITOFF, St. Bartholomew's Hospital Medical College.  
Mr. T. M. LING, St. Thomas's Hospital Medical School.  
Mr. M. MASSER, Leeds University.  
Mr. K. S. SMITH, Middlesex Hospital Medical School.  
Mr. A. WALKER, Glasgow University.  
Mr. T. C. S. WEBB, University College Hospital Medical School.

Under the arrangements made by the Council of the Association, the prizes will, as far as possible, be presented at the meetings held by the Divisions or Branches concerned to welcome newly qualified members of the profession. Full particulars of the result of the competition have been sent by post to the Deans of the Medical Schools and to all the competitors.

**Assistant Medical Officer of Health, Plymouth.**

The advertisement for an assistant medical officer of health for Plymouth does not appear in the *BRITISH MEDICAL JOURNAL*, though it is appearing elsewhere. The advertisement was not offered to the *BRITISH MEDICAL JOURNAL* because the Plymouth Town Council had been notified that the Association would not be prepared to insert any advertisement for a successor to Dr. F. G. Bushnell unless and until the town council consented to give Dr. Bushnell, the late officer, the reasons for his dismissal. The Association takes no exception to the legality of that dismissal, but considers that in common courtesy an officer of many years' service was entitled to the reasons for his dismissal when he pressed for them. No objection is taken to the terms at present being offered for the vacant post, but candidates should make themselves acquainted with the circumstances of Dr. Bushnell's dismissal, and consider whether they will be taking undue risk in accepting the appointment if offered to them.

**Association Notices.****BRANCH AND DIVISION MEETINGS TO BE HELD.**

**CAPE OF GOOD HOPE (WESTERN) BRANCH.**—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, May 29th, at 8 p.m., when a discussion on asthma will take place. Among the contributors to the debate are Professor W. Campbell, Professor J. W. C. Gunn, Mr. C. E. Jones-Phillipson, and Dr. P. W. J. Keet.

**EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.**—The annual meeting of the South-Eastern Counties Division will be held in the Railway Hotel, Newtown St. Boswells, on Wednesday, April 29th, at 3 p.m. Business: Election of officers; annual report and financial statement for 1924; applications for recognition as ophthalmic consultants; ophthalmic lectures; instructions to Representative in Council.

**LANCASHIRE AND CHESHIRE DIVISION.**—A picnic to Nantwich will be held on Thursday, May 21st, in which it is hoped that as many members as possible will participate. Messrs. "Trufood," Ltd., of Wronbury, have offered to show the party over their dried milk factories and demonstrate the process of manufacture. Nantwich has an excellent golf course, and the secretary would endeavour to arrange for permission to play for those desiring to do so. Details of meeting place and route will be announced later.

**LANCASHIRE AND CHESHIRE BRANCH: ROCHEDALE DIVISION.**—The annual meeting of the Rochdale Division will be held in the Wellington Hotel, Drake Street, Rochdale, on Wednesday, April 29th, at 8.30 p.m. Business: Annual statement for 1924; election of Representative, Deputy Representative, officers, and Executive Committee for the ensuing year.

**LANCASHIRE AND CHESHIRE BRANCH: SOUTHPORT DIVISION.**—A meeting of the Southport Division will be held at 52, Hoghton Street, Southport, on Friday, May 1st, at 8 p.m., when Dr. A. F. Hurst will give a British Medical Association Lecture on the pathogenesis, diagnosis, and treatment of duodenal ulcer.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A Divisional dinner and fancy dress dance and carnival—fancy dress optional (four prizes)—will be held at the Holborn Restaurant on Thursday, April 30th, from 7.30 p.m. to 2 a.m.; bridge. Refreshments during evening. Tickets 15s.; early application will be greatly appreciated by Dr. Ernest A. Worley (honorary secretary), 43, De Beauvoir Road, N.1.

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—The Kensington Divisional dance will be held in the Kensington Town Hall on Thursday, May 7th. All money over after expenses have been paid will be handed to the Royal Medical Benevolent Fund and the Royal Medical Benevolent Fund Guild. Further details will appear later, or can be obtained from the Honorary Secretary, 20, Upper Phillimore Place, W.8.

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.**—The annual meeting of the Lewisham Division will be held at the Parish Room, St. Laurence Vicarage, Catford, S.E.6, on Tuesday, May 19th, at 8.45 p.m., when an address will be delivered by Dr. James Neal, secretary of the Medical Defence Union.

**METROPOLITAN COUNTIES BRANCH: MARTLEBONE DIVISION.**—The annual general meeting of the Martlebone Division will be held at 11, Chaudos Street, W.1, on Friday, May 8th, at 8.30 p.m., for the election of officers and representatives and nominations to the Branch Council. A discussion on the annual report of Council will also take place.

**METROPOLITAN COUNTIES BRANCH: NORTH MIDDLESEX DIVISION.**—A meeting of the North Middlesex Division will be held in the Prince of Wales's Hospital, Tottenham, on Wednesday, April 29th, at 3.30 p.m., when Mr. Frank Coke will read a paper on asthma. The Executive Committee looks forward to a good attendance of members at this meeting.

**METROPOLITAN COUNTIES BRANCH: NORTH MIDDLESEX DIVISION.**—The annual meeting of the North Middlesex Division will be held at the "St. John" on Wednesday, May 6th, at 8.30 p.m. A representative, (2)

**METROPOLITAN COUNTIES BRANCH: WEST MIDDLESEX DIVISION.**—A visit to the West Middlesex Hospital, Isleworth, has been arranged, by the courtesy of Dr. Cook, for Thursday, April 30th. Tea at 4 p.m.

**METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISION.**—The annual general meeting of the Westminster and Holborn Division will be held at the Criterion Restaurant on Thursday, May 7th, at 8.30 p.m. After the business a paper will be read by Sir William J. Collins, K.C.V.O., M.D., F.R.C.S., entitled "The control of the traffic in drugs of addiction." The meeting will be preceded by dinner at 7.30, the price of which (5s.) should be paid to the Secretary at the table. A large attendance is hoped for.

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—At the meeting of the Chesterfield Division to be held in the Maternity Hospital, Chesterfield, on Friday, May 8th, at 8.30 p.m., a discussion on difficulties in breast-feeding will be opened by Dr. H. W. Pooler.

**NORTH OF ENGLAND BRANCH: NORTH NORTHUMBERLAND DIVISION.**—A meeting of the North Northumberland Division will be held on Thursday, April 30th, at 3 p.m., in the Infirmary, Alnwick. Agenda: Election of Representative to Annual Meeting; Annual Report of Council. It is proposed to make a presentation to Dr. James Don in recognition of his great services to the medical profession in the North of England, and members who wish to subscribe are asked to send their contributions, limited to 10s. 6d., to Drs. R. E. Moyes and W. G. Scott (honorary secretaries) before the end of this month.

**NORTH OF ENGLAND BRANCH: STOCKTON DIVISION.**—The annual general meeting of the Stockton Division will be held in the Stockton and Thornaby Hospital on Friday, May 1st, at 8.30 p.m. Agenda: Election of (1) office-bearers, (2) Representative and Deputy Representative for Representative Body; Annual Report of Council (see SUPPLEMENT, April 11th).

**NORTH WALES BRANCH.**—The spring meeting of the North Wales Branch will be held at the Imperial Hotel, Rhyl, on Tuesday, April 28th, at 2 p.m. Agenda: Correspondence; report of the Branch Council; papers.—Mr. J. Howell Evans, F.R.C.S. (London): Hydrocele, pyocoele, and haematocoele, illustrated by drawings and specimens; Dr. Kilner (Llandudno): Pain in childbirth, with a method of alleviation; Dr. Gardner-Medwin (St. Asaph): The clinical significance of the leucocyte count in influenza pneumonia.

**SOUTH WALES AND MONMOUTHSHIRE BRANCH: NORTH GLAMORGAN AND BRECKNOCK DIVISION.**—A meeting of the North Glamorgan and Brecknock Division will be held on Thursday, May 7th, at 6 p.m., when Mr. Joseph E. Adams will give a British Medical Association Lecture on acute abdominal symptoms in children. The meeting will be followed at 7.30 by a dinner at the New Inn Hotel, Pontypridd.

**SURREY BRANCH: CROYDON DIVISION.**—The annual meeting of the Croydon Division will be held at the Croydon General Hospital on Wednesday, May 6th, at 3.30 p.m. It will be followed by a clinical meeting.

**SURREY BRANCH: GUILDFORD DIVISION.**—The Guildford Division will hold a clinical meeting in the wards of the Royal Surrey County Hospital, Guildford, on Thursday, May 7th, at 4 p.m.; tea will be served at 3.45.

**ULSTER BRANCH.**—At the meeting of the Ulster Branch to be held at Londonderry on Thursday, April 30th, a British Medical Association Lecture will be delivered by Lieut.-Colonel R. McCarrison, C.I.E., I.M.S., on some problems of thyroid disease.

**YORKSHIRE BRANCH: HARROGATE DIVISION.**—The annual meeting of the Harrogate Division will be held at the Imperial Café, Parliament Street, on Tuesday, May 5th, at 8.30 p.m.

**YORKSHIRE BRANCH: SHEFFIELD DIVISION.**—The annual meeting of the Sheffield Division will be held at the Church House, St. James Street, Sheffield, on Friday, May 15th, at 8.30 p.m. Agenda: Report of Executive Committee; election of officers and representatives.

At the last meeting of Council Mr. W. E. Hempton was reappointed Solicitor to the British Medical Association for a period of twelve months.

**TABLE OF DATES.**

April 25, Sat.	Last day for receipt of nominations for election of 24 members of Council by grouped Home Branches, and of 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 9, Sat.	Publication in SUPPLEMENT of nominations for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives. Voting papers posted.
May 12, Tues.	Independent motions for A.R.M. Agenda must be received at Head Office by this date.
May 16, Sat.	Last day for receipt of voting papers for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives.
May 30, Sat.	Publication in SUPPLEMENT of independent motions for A.R.M. Agenda. Voting papers posted. Council elections by grouped Home Branches, and of election of members of Council and Representatives in Representative Body by Public Health Service members.
June 4, Thurs.	Nomination papers available for election of 12 members of Council by grouped Home Representatives.
June 10, Wed.	Names of Representatives and Deputy-Representatives must be received by this date.
June 18, Thurs.	Council Meeting.
June 27, Sat.	Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.
July 3, Fri.	Supplementary Report of Council appears in SUPPLEMENT. Amendments and riders for issue in A.R.M. Agenda must be received by this date.
July 17, Fri.	Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.

ALFRED COX, Medical Secretary.

## Meetings of Branches and Divisions.

### ESSEX BRANCH: NORTH-EAST ESSEX DIVISION.

The annual meeting of the North-East Essex Division was held at the Red Lion Hotel, Colchester, on April 3rd, when the following officers were appointed for the ensuing year:

Chairman, Dr. W. T. A. Clowes (Colchester). Honorary Secretary, Dr. Fox (Colchester). Honorary Representative Body, Dr. Pedler.

The report of the representative at the special meeting on National Health Insurance was received, and Dr. Fox was thanked for the attention and time given to the matter.

### NORTH OF ENGLAND BRANCH: HARTLEPOOLS DIVISION.

At a meeting of the Hartlepoons Division on March 26th Mr. F. C. Pybus, M.S. (Newcastle-on-Tyne), gave a most instructive address on some deformities of childhood and their treatment. Mr. Pybus dealt with the calamitous deformities which frequently result from infantile paralysis, rickets, and tuberculosis, and laid stress on the fact that a very large proportion of these were eminently preventable, though calling for much ingenuity and patience on the part of the surgeon. He discussed various means which the general practitioner might employ to this end, and illustrated by several cases the remarkable results which orthopaedic surgery could achieve in correcting old-standing and apparently almost hopeless deformities. The interest of the lecture was enhanced by a collection of most interesting photographs and x-ray films. In conclusion, Mr. Pybus emphasized the necessity for the establishment of special institutions for the treatment of these cases.

## Correspondence.

### The Liberties of the Profession.

SIR,—Judging from an angry protest received by me to-day, my letter published in the SUPPLEMENT of April 18th (p. 173) is capable of misinterpretation. I had thought myself that I made it transparently clear that by terms "already privately exacted" by societies I referred to the original terms, which were in fact "already privately exacted," and not to the final terms, modified by strenuous action on the part of the British Medical Association. As my indignant correspondent interprets my letter as an effort to "belittle the great work that was done" by the latter, it becomes incumbent upon me to add this note, for no such intention ever entered my head, my desire being merely that our Association should complete the "great work" which it began. In conclusion I would recapitulate the original terms which were privately exacted by the societies.

1. Medical as well as sickness benefit to be administered by themselves.

2. Voluntary insurance to be permitted for life after five years, whatever the subsequent financial position of the insured, who might become a millionaire.

3. Payment at the rate of 4s. per annum for each insured person to be made to societies for mere administration of sickness and maternity benefit, the same sum only being allowed to doctors for treatment.

4. Additional payment, for six months at the rate of 1s. per insured person, for "promotion expenses," a sum which proved much in excess of that required.

5. A free gift of the whole of the accumulated reserves held by the societies for all their 5½ million members who were over 16 years of age, the capitalized value of this asset being estimated by the Commissioners to be 10 million pounds at least, and by Mr. Thomas Smith, barrister, and author of *Everybody's Guide to the National Insurance Act*, to be 20 millions.—I am, etc.,

Colchester, April 18th.

G. C. GARRATT.

### Royal Commission on National Health Insurance: Psychology of the Memorandum of Evidence.

SIR,—It may have been that the polemics of destructive criticism appealed less to the liking of the Council than an exhibition in the gentle art of constructive unification, which probably accounts for the omission from the Memorandum of any reference to the pernicious aspects of the Regulations, and to the abuse of "the semi-judicial functions of the Ministry." Be this as it may, it is wellnigh incredible that the Conference could have pledged the commitment of the profession's preparedness "to undertake the work in accordance with the scheme of National Health Insurance" therein outlined, which is more notable for discrepancy of fact than consistency of purpose, and of which the following may be cited as examples of the disregard for immaculate exactitude:

1. In face of the radical amendments of the Regulations and terms of service respectively advocated in Sections C and D, Part II, of the Memorandum, how the Council could have had the temerity to subscribe its endorsement to an assertion which

claims "it is during the last three years only that the system can be said to have been working in a really smooth and normal fashion," is absolutely incomprehensible. If a progressive increase in degradation and servility, consistently heaped upon the practitioner's integrity, be the comparative criterion of a growing acceptability of the medical service, then the number of delinquent offences recorded against practitioners, having increased threefold "during the last three years," amply testifies to the bureaucratic art of administering the Regulations "in a really smooth and normal fashion."

2. Although the Memorandum admits, by implication, the existence of this vicious propensity, and also complains that the rate of remuneration has all along been, and still is, inadequate, yet here the Council disavows all responsibility in both respects by leaving the former arrangements intact, whereby "the Association has for some years past been content to leave to the Conference the decisions of all questions of details, regulations, and negotiations as regards remuneration." What hope of betterment in that "content"?

3. There is no parallel in the annals of the profession comparable to the contumacious servitude of the panel system; it has done more in twelve years to prejudice the reputation and to lower the prestige of the profession in the public estimation than "club" practice has inflicted upon its votaries during the whole period of its unorganized existence from time immemorial; and it is morally certain that in no other field of part-time service, similarly conditioned, would the Council tolerate the exposure of the members to the "perils of the panel" for one moment, and would boycott the service as professionally derogatory; yet here we have the Council standing apathetically aside, in a sort of assumed *non possumus* attitude, in full view of the Minister's implements of vindictive castigation lashing his victims at the pleasure of his will.

4. After the meeting of the joint Conference, apparently the Council's inclination was more definitely bent on its mission to present a Memorandum of Evidence of the "really smooth and normal fashion" of the working of the system to the Royal Commission than to prosecute the claim of insurance practitioners for release from the duress of oppressive Regulations before that body up to March 25th, when at its meeting the Council decided there and then to adopt and to incorporate into the Memorandum a supplementary paragraph, previously drafted, of representations critical of "the semi-judicial functions of the Ministry" in relation to the "liberties of the profession." No practitioner could cavil at this belated action of the Council; but having regard to the circumstances of fact—(1) the omission of any reference to the subject-matter in the Memorandum; (2) the aversion of the Conference to discuss its bearing; (3) the absence of any mandate from the Conference to the Council; and (4) that this addendum of evidence cannot be considered to be one of the resolutions of the Conference which "were then reported to the Council at its meeting on March 25th, and were finally incorporated in the Memorandum here presented"—how does the Memorandum of Evidence, as amended by the Council, stand in relation to the endorsement of the Conference? The incorporation of this supplementary paragraph fundamentally alters the perspective of the whole context. The very nature of the animadversions amount to an admission that the system of service is *not* working in "a really smooth and normal fashion," and thereby dissipates the immaculacy of the basis, along with any justification for the claim that may have previously existed, on which to build the superstructure of a scheme of proposals, and whereby the Conference is absolved from its endorsement and pledge of commitment of the profession, etc.

It may be, after all, that public opinion, as voiced through the *Times* in a common-sense way, has effected by one fell stroke of the editorial pen what the loyalty and honour of professional brotherhood failed to undertake, either through the Council or the Insurance Acts Committee on behalf of its victimized members. Well may the outsider wonder what has become of the ancient and noble traditions of the medical profession. Echo, reverberating from the caverns of the Memorandum of Evidence, answers, *Non est*.—I am, etc.,

Eastbourne, April 18th.

WM. MUIR SMITH.

### British Medical Association.

#### CURRENT NOTES.

##### Glasgow and Recruitment for the Association.

It will give great pleasure to those who are interested in the success of the British Medical Association to hear that the membership now exceeds 29,000. This is nearly 3,000 above the high-water mark of 1912, the culmination of a period of temporary inflation. The present figures show a clear and steady gain to the Association of over 9,000 members during the last seven years. The causes of this satisfactory situation are many, but one of the most outstanding is the action of those Branches and Divisions in whose areas lie the medical schools, and of this action the Glasgow and West of Scotland Branch has just reported a striking example. On April 21st the Branch held a social reception of the new graduates in the University Union; the 110 who attended were received by the President of the Branch, Dr. W. T. Blakeley, and other members of the Branch Council, and entertained to tea, followed by a musical programme provided by Dr. J. Wallace Anderson, Mrs. Anderson, and some lady friends. After the musical programme, which was greatly enjoyed, the President introduced Professor J. R. Currie, who addressed the new graduates in a manner which was highly appreciated. He was followed by Dr. Drever, the Scottish Medical Secretary, who dealt specially with the work of the Association, by Dr. G. A. Allan, and by the Chairman. The result of this effort of the Branch was most gratifying, as out of the 131 who graduated on April 22nd, 122 have joined the Association, and the Branch, and especially its energetic secretary, Dr. J. G. McCutcheon, are to be highly congratulated.

##### Puerperal Morbidity Committee.

As has already been announced, the Council at its last meeting appointed a special committee to consider and report on the causation of puerperal morbidity and mortality, and on the administrative action, if any, that should be taken in connexion with the matter. The Committee consists of the officers of the Association, the Chairman of the Medico-Political Committee (Mr. E. B. Turner, London), Mr. Comyns Berkeley (London), Dr. J. W. Bone (Luton), Dr. G. F. Buchan (Willesden), Dr. H. J. Cardale (London), Dr. C. E. Douglas (Cupar, Fife), Dr. C. E. S. Flemming (Bradford-on-Avon), Sir Ewen Maclean (Cardiff),

Dr. Christine Murrell (London), Dr. Mabel Ramsay (Plymouth), Dr. W. E. Thomas (Ystrad Rhondda), and Sir T. Jenner Verrall (Leatherhead), with power to co-opt not more than two other members. The Committee met on April 23rd, and agreed that this was an opportunity for the British Medical Association to do a piece of professional work which, it was hoped, would not only redound to its credit, but prove of great benefit to the public. Sir Ewen Maclean was appointed chairman. The Committee will have before it the report of Dame Janet Campbell, the report of the Scottish Departmental Committee on Puerperal Morbidity and Mortality, the report of the Special Committee of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine, and the Transactions of the Congress of Obstetrics and Gynaecology held last week. The Committee will be glad to receive from any members of the profession further information on the subject, or suggestions as to action that might usefully be taken. These should be addressed to the Medical Secretary, 429, Strand, W.C.2.

##### Australasian Medical Congress, 1923.

The Transactions of the Australasian Medical Congress (British Medical Association), which was held in Melbourne from November 12th to 17th, 1923, were published as a Supplement to the *Medical Journal of Australia*, and have now been reprinted in book form. An account of the Congress appeared in four issues of the *BRITISH MEDICAL JOURNAL* (January 5th, 12th, 19th, and 26th, 1924), and the fuller details now available will be of considerable interest to those who have appreciated its importance. The British Medical Association was represented by its retiring President, the late Sir William Maclewen, and abstracts of the address he delivered and of his contributions to the discussions are included. The volume is well bound and has a good index.

##### Flags for the Great Hall.

By an inadvertence Leicester was omitted from the list of those areas in which Annual Meetings of the British Medical Association have been held which propose to present a flag for hanging in the Great Hall in the new home of the Association. Intimations have been received from several secretaries that the matter is under consideration, and it is hoped that on the opening day every niche will be filled.

<sup>1</sup> *Australasian Medical Congress* (British Medical Association). Transactions of the First Session, Melbourne. Sydney: Sydney and Melbourne Publishing Co., Ltd. 1924. (Demy 4to, pp. viii+552; illustrated.)

## Association Notices.

PROPOSED CHANGE OF AREAS OF DERBY AND  
CHESTERFIELD DIVISIONS.

NOTICE is hereby given to all concerned of the following proposal made by the Executive Committee of the Chesterfield Division:

That the Baslow and Bubbnell Urban District, and the Civil Parish of Eyam in Bakewell Rural District, be transferred from the Derby to the Chesterfield Division.

Written notice of the proposal is being given to the Midland Branch and the Chesterfield and Derby Divisions, and the matter will be determined in due course by the Council of the Association. Any member affected by the proposed change, and objecting thereto, is requested to send a statement of the fact, and of the reasons therefor, to the Medical Secretary, 429, Strand, W.C.2, to reach him not later than June 2nd, 1925.

ALFRED COX, Medical Secretary.

## TABLE OF DATES.

May 9, Sat.	Publication in SUPPLEMENT of nominations for election of 24 members of Council by grouped Home Branches, 2 Public Health members of Council, and 4 Public Health Service Representatives. Voting papers posted.
May 12, Tues.	Independent motions for A.R.M. Agenda must be received at Head Office by this date.
May 16, Sat.	Last day for receipt of voting papers for election of 24 members of Council, and 4 Public Health Service Representatives.
May 30, Sat.	Publication in SUPPLEMENT of Independent motions for A.R.M. Agenda. Representatives and Deputy-Representatives must be elected by this date.

July 18, Sat.	Annual Representative Meeting, Bath.
July 20, Mon.	Annual Representative Meeting, Bath.
July 21, Tues.	Annual Representative Meeting, Bath.
July 22, Wed.	Bath, President's Address.
July 23, Thurs.	Council, Meetings of Sections, Conference of Honorary Secretaries, Bath.
July 24, Fri.	Meetings of Sections, etc., Bath.

ALFRED COX, Medical Secretary.

## BRANCH AND DIVISION MEETINGS TO BE HELD.

**BATH AND BRISTOL BRANCH: BRISTOL DIVISION.**—A meeting of the Bristol Division will be held at the University, Room 40, to-day (Friday, May 1st), at 5 p.m. Business: To elect Representatives and Deputy Representatives for the Annual Meeting at Bath; to consider the Annual Report of Council. The sections will be introduced as follows: (a) Medical Ethics and Medico-Political, by Dr. Bristowe; (b) National Health Insurance, by Dr. Robertson; (c) Public Health, by Dr. Askins; (d) Hospital Policy, by Dr. Herapath. Members are requested to take with them to the meeting the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of April 11th.

**BORROW BRANCH: DUMFRIES AND GALLOWAY DIVISION.**—The annual meeting of the Dumfries and Galloway Division will be held in the Royal Infirmary, Dumfries, on Thursday, May 21st, at 3.30 p.m. Professor B. P. Watson, M.D. (Edinburgh University), will deliver a British Medical Association Lecture on the treatment of abortion.

**CAPE OF GOOD HOPE (WESTERN) BRANCH.**—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, May 29th, at 8 p.m., when a discussion on asthma will take place. Among the contributors to the debate are Professor W. Campbell, Professor J. W. C. Gunn, Mr. C. E. Jones-Phillipson, and Dr. P. W. J. Keet.

**DORSET AND WEST HANTS BRANCH: Bournemouth Division.**—The annual meeting of the Bournemouth Division will be held on Wednesday, May 6th, at 4.15 p.m., in St. Peter's Hall, Bournemouth. Further report of Representative to Representative Meeting, 1924; report and financial statement for 1924; arrangement as to time and place of annual social meeting; election of officers and committee for 1925. The chairman, Dr. Morse, invites members to tea at 4 p.m.

**LANCASHIRE AND CHESHIRE BRANCH: HYDE DIVISION.**—A picnic to Nantwich will be held on Thursday, May 21st, in which it is hoped that as many members as possible will participate. Messrs. "Trufood," Ltd., of Wrenbury, have offered to show the party over their dried milk factories and demonstrate the process of manufacture. Nantwich has an excellent golf course, and the secretary would endeavour to arrange for permission to play for those desiring to do so. Details of meeting place and route will be announced later.

**LANCASHIRE AND CHESHIRE BRANCH: SOUTHPORT DIVISION.**—A meeting of the Southport Division will be held at 52, Hoghton Street, Southport, to-day (Friday, May 1st), at 8 p.m., when Dr. A. F. Hurst will give a British Medical Association Lecture on the pathogenesis, diagnosis, and treatment of duodenal ulcer.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, on Tuesday, May 12th, at 9.30 p.m., when a paper will be read by Dr. A. Westerman, chairman of the Division.

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—The Kensington Division will be held at the Kensington Town Hall on Thursday, May 7th. All money over after expenses have been paid will be handed to the Royal Medical Benevolent Fund and the Royal Medical Benevolent Fund Guild.

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.**—The annual meeting of the Lewisham Division will be held at the Parish Room, St. Laurence Vicarage, Catford, S.E.6, on Tuesday, May 19th, at 8.45 p.m., when an address will be delivered by Dr. James Neal, secretary of the Medical Defence Union.

**METROPOLITAN COUNTIES BRANCH: MARYLEBONE DIVISION.**—The annual general meeting of the Marylebone Division will be held at election of officers and representatives and nominations to the Branch Council. A discussion on the annual report of Council will also take place.

**METROPOLITAN COUNTIES BRANCH: SOUTH MIDDLESEX DIVISION.**—The annual meeting of the South Middlesex Division will be held at St. John's Hospital, Twickenham, on Wednesday, May 6th, at 8.30 p.m. Agenda: Election of officers; reports (1) of the Representative, (2) of the Honorary Secretary.

**METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.**—A meeting of the South-West Essex Division will be held at Livingstone College, Knotts Green, Leyton, on Tuesday, May 5th, at 3.30 p.m. Agenda: Election of Representative to the Representative Body; to discuss the Annual Report of Council of the British Medical Association and to prepare any resolutions pertaining thereto. At 4.15 p.m. Dr. J. H. Sequeira will give a demonstration of the modern treatment of tuberculosis of the skin and will show a series of lantern slides. Tea will be served at 3.15.

**METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISION.**—The annual general meeting of the Westminster and Holborn Division will be held at the Criterion Restaurant on Thursday, May 7th, at 8.30 p.m. After the business a paper will be read by Sir William J. Collins, K.C.V.O., M.D., F.R.C.S., entitled "The control of the traffic in drugs of addiction." The meeting will be preceded by dinner at 7.30, the price of which (5s.) should be paid to the Secretary at the table. A large attendance is hoped for.

**MIDLAND BRANCH: CHESTERFIELD DIVISION.**—The annual general meeting of the Chesterfield Division will be held at the Station Hotel, Chesterfield, to-day (Friday, May 1st), at 3 p.m. Agenda: Annual report and balance sheet; election of officers; Reports of Council and instructions to Representative (see SUPPLEMENTS to BRITISH MEDICAL JOURNAL, April 11th and 18th).

**NORTH OF ENGLAND BRANCH: NORTH NORTHUMBERLAND DIVISION.**—A meeting of the North Northumberland Division will be held on Thursday, April 30th, at 8.30 p.m. Agenda: Election of officers; Reports of Council and instructions to Representative (see SUPPLEMENTS to BRITISH MEDICAL JOURNAL, April 11th and 18th).

**NORTH OF ENGLAND BRANCH: STOCKTON DIVISION.**—The annual general meeting of the Stockton Division will be held in the Stockton and Thornaby Hospital to-day (Friday, May 1st), at 8.30 p.m. Agenda: Election of (1) office-bearers, (2) Representative and Deputy Representative to the Representative Body; Annual Report of Council (see SUPPLEMENT, April 11th).

**NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.**—A scientific meeting of the Sunderland Division will be held at the Mental Hospital, Ryhope, on Wednesday, May 27th, at 3.30 p.m. All members of the Division are invited to be present.

**SHROPSHIRE AND MID-WALES BRANCH.**—The annual spring meeting of the Shropshire and Mid-Wales Branch will be held at the Royal Salop Infirmary on Tuesday, May 19th, at 3.30 p.m., when Dr. R. A. Young, physician to the Middlesex and Brompton Hospitals, will read a paper. The Annual Report of the Council (published in the SUPPLEMENT of April 11th) will be considered, and officers elected for the ensuing year. A large attendance is hoped for.

**SOUTH MIDLAND BRANCH: BEDFORDSHIRE DIVISION.**—A general meeting of the Bedfordshire Division will be held at the Bedford County Hospital on Tuesday, May 5th, at 3 p.m. Agenda: To elect a Representative and Deputy Representative; to consider the Annual Report of Council for 1924-25 (see SUPPLEMENT to BRITISH MEDICAL JOURNAL for April 11th, which members are requested to take to the meeting). Tea will be provided.

**SOUTH WALES AND MONMOUTHSHIRE BRANCH: NORTH GLAMORGAN AND BRECKNOCK DIVISION.**—A meeting of the North Glamorgan and Brecknock Division will be held on Thursday, May 7th, at 6 p.m., when Mr. Joseph E. Adams will give a British Medical Association Lecture on acute abdominal symptoms in children. The meeting will be followed at 7.30 by a dinner at the New Ion Hotel, Pontypridd.

**SOUTH-WESTERN BRANCH.**—An intermediate meeting of the South-Western Branch will be held at Barnstaple on Thursday, May 7th. The agenda paper will be circulated in due course.

**SOUTH-WESTERN BRANCH: EXETER DIVISION.**—The next meeting of the Exeter Division will be held to-day (Friday, May 1st), at 3.30 p.m., in the library of the Royal Devon and Exeter Hospital, when Dr. F. A. Roper will give a lecture on some principles in endocrinology.

**STAFFORDSHIRE BRANCH: NORTH STAFFORDSHIRE DIVISION.**—A special meeting of the North Staffordshire Division will be held at the North Stafford Hotel on Tuesday, May 5th, at 3.45 p.m., when Mr. L. E. Young will take the chair. The agenda includes consideration of the Annual Report of Council and appointment of Representative to Representative Body.

**SURREY BRANCH: CROYDON DIVISION.**—The annual meeting of the Croydon Division will be held at the Croydon General Hospital on Wednesday, May 6th, at 3.30 p.m. It will be followed by a clinical meeting.

**SURREY BRANCH: GUILDFORD DIVISION.**—The Guildford Division will hold a clinical meeting in the wards of the Royal Surrey County Hospital, Guildford, on Thursday, May 7th, at 4 p.m.; tea will be served at 3.45.

**SURREY BRANCH: KINGSTON-ON-THAMES DIVISION.**—The annual general meeting of the Kingston-on-Thames Division will be held at Surbiton Hospital on Tuesday, May 5th, at 8.30 p.m. Agenda: Annual report; election of officers for 1925-26; consideration of Annual Report of Council (British Medical Journal Supplement for April 11th, which members are requested to take with them); and instruction of Representatives; adoption of new rules.

**WORCESTERSHIRE AND HEREFORDSHIRE BRANCH: HEREFORD DIVISION.**—A meeting of the Hereford Division will be held at 20, East Street, Hereford, on Monday, May 4th, at 3.30 p.m. The agenda include consideration of mileage fees for emergency midwifery cases; election of Representative and Deputy Representative to Annual Representative Meeting.

**YORKSHIRE BRANCH: HARROGATE DIVISION.**—The annual meeting of the Harrogate Division will be held at the Imperial Café, Parliament Street, on Tuesday, May 5th, at 8.30 p.m.

**YORKSHIRE BRANCH: SHEFFIELD DIVISION.**—The annual meeting of the Sheffield Division will be held at the Church House, St. James Street, Sheffield, on Friday, May 15th, at 8.30 p.m. Agenda: Report of Executive Committee; election of officers and Representatives.

## Meetings of Branches and Divisions.

### ASSAM BRANCH.

The annual general meeting of the Assam Branch was held at Jorhat on March 2nd, when the President, Dr. E. T. JAMESON, was in the chair.

Papers were read by Lieut.-Colonel CHRISTOPHERS, I.M.S., Lieut.-Colonel PALMER, R.A.M.C.(ret.), Dr. G. C. RAMSAY, Dr. F. W. O'CONNOR, and Dr. C. STRICKLAND, Professor of Entomology, School of Tropical Medicine, Calcutta.

The report of the Branch Council for the year 1924 was read, and the audited statement of accounts submitted and approved.

The following officers were elected for 1925:  
President, Dr. G. C. Ramsay, O.B.E. Honorary Secretary and Treasurer, Dr. D. Meek, Khumbir P.O., Cachar.

It was resolved to extend a cordial welcome to the Chairman and Vice-Chairman of the Assam and Surma Valley Branches of the Indian Tea Association and a Calcutta representative from each Calcutta tea agency house at any meetings of the Branch.

### LANCASHIRE AND CHESHIRE BRANCH: MID-CHESHIRE DIVISION.

The following officers have been elected for the ensuing year:

Chairman, Dr. R. Manwaring-White. Vice-Chairman, Dr. T. Morton. Honorary Secretary, Dr. R. Reid Duncan. Representative in Representative Body, Dr. T. W. H. Garstang. Deputy Representative, Dr. P. R. Cooper.

The report of the Executive Committee presented to the annual meeting gave particulars of lectures delivered to the Division during the year, including one on the legal aspect of insanity by Mr. N. J. Laski, barrister-at-law, and two British Medical Association Lectures—by Dr. Geoffrey Evans (London) on the essential signs of arterio-sclerotic disease, and by Dr. Kinnier Wilson (London) on neuritis and neurasthenia—which were much appreciated by those present.

### LANCASHIRE AND CHESHIRE BRANCH: WARRINGTON DIVISION.

The annual meeting of the Warrington Division was held at the Infirmary on April 24th, when Dr. A. ANDERSON was in the chair. The Secretary, Dr. J. S. MANSON, reported that there had been seven ordinary meetings of the Division during the year and five meetings of the Executive Committee. The Scientific Meeting held in December was a great success.

The following were elected officers for the ensuing session:  
Chairman, Dr. J. S. Manson. Vice-Chairman, Dr. Albert Jones, D.S.O., M.C. Secretary and Treasurer, Dr. David Melkie.

The Annual Report of Council was discussed, but no formal resolutions were adopted. This business was left to the joint meeting with the St. Helens Division on May 14th.

### METROPOLITAN COUNTIES BRANCH: HENDON DIVISION.

#### Inaugural Meeting.

The inaugural meeting of the Hendon Division was held on April 23rd at the Refectory Restaurant, Golders Green, N.W. Mr. N. BISHOP HARMAN, F.R.C.S., Treasurer of the British Medical Association, presided, and after some introductory remarks Mr. H. STEDMAN was appointed chairman of the meeting.

The notice convening the meeting was read, and the report that

the area of the Division be the Urban District of Hendon was received. The meeting adopted (1) rules of organization, and (2) rules governing procedure in ethical matters.

The following officers were appointed for the ensuing year:

Chairman, Mr. H. STEDMAN. Vice-Chairman, Professor R. T. LEIPER, F.R.S. Honorary Secretary, Mr. MYER COPLAND. Clinical Secretary, Mr. LEONA. Representative Body, Dr. James Neal.

The Executive Committee was appointed to act as an Ethical Committee. Further consideration of the clinical and social activities of the Division was postponed until the next meeting.

On the motion of Professor R. T. LEIPER, seconded by Dr. KATHELEEN BROWN, a vote of thanks was unanimously accorded to Mr. H. STEDMAN for his services as chairman of the meeting.

### SOUTHERN BRANCH: WINCHESTER DIVISION.

A most successful meeting of the Winchester Division was held on April 23rd, at Lord Mayor Treloar Cripples' Hospital and College at Alton, by the courtesy of the medical superintendent, Sir Henry Gauvain.

On the conclusion of the usual routine business the members, and also several non-members who had accepted the invitation of the Executive Committee, visited the wards, where Sir HENRY GAUVAIN demonstrated the different measures employed in the treatment of the large numbers of every variety of surgical tuberculosis dealt with. Great interest was shown in the methods of quarantine in force with all newly admitted cases to avoid the introduction of the various infectious diseases which are always such a huge burden in the administration of children's hospitals. The visit to the light department was a revelation to the party. Sir Henry described the various types of apparatus in use and the technique followed, illustrating his remarks by showing many cases in various stages of cure. Visits were also paid to the open-air wards, nursery school, and the splint room. In the latter, numbers of celluloid jackets, splints, etc., in different stages of manufacture were shown. Finally, in the photographic department a large number of photographs were exhibited of children under treatment at Alton and the Haying Island branch, which graphically illustrated the different methods employed and the brilliant results achieved at both places.

After a hearty vote of thanks had been accorded to Sir Henry Gauvain, the latter entertained the party to tea, thus bringing to a happy conclusion a meeting that will be long remembered by those who were fortunate enough to take part in it.

## National Insurance.

### THE ROYAL COMMISSION.

THE twenty-fifth meeting of the Royal Commission on National Health Insurance was held at the Home Office on April 23rd, Sir Andrew Duncan in the chair.

Evidence was given on behalf of the National Sailors' and Firemen's Union by Mr. Chambers, who dealt with the special arrangements for seamen. The Loyal Order of Ancient Shepherds, represented by Mr. Grieve, Deputy Chief Shepherd, and Mr. Saunders, general secretary, were examined on questions of extensions of benefit, pooling of surpluses, organization of branch societies, etc. The Association of Approved Societies, representing about 150 societies and 1,500,000 members, gave evidence through Messrs. Hilton, Robert Smith, and Goodwin on matters affecting their constituent societies. Thereafter Miss A. Cameron and Miss M. Hamilton were examined on behalf of the Standing Committee of Scottish Insured Women as to a variety of matters affecting women's interests in health insurance.

Proof copies of the oral evidence and the relative statements submitted at the meetings of March 26th and April 2nd, 1925, may be obtained from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, on remittance of cost (4s. 6d. and 2s. 3d. respectively) and postage.

### FACTORY MEDICAL SERVICES AS A PART OF NATIONAL HEALTH INSURANCE.

#### EVIDENCE OF SIR T. M. LEGGE.

Evidence which the Chairman of the Commission described as "breaking new ground" was given to the Royal Commission on National Health Insurance on April 2nd by Sir Thomas Morison Legge, M.D., Senior Medical Inspector of Factories. His proposals, which represented his personal views and were not in any sense official, were that the certifying factory surgeons should be brought into the administration of National Health Insurance, and that the clinical knowledge of insurance practitioners should be utilized in preventive work in factories.

Sir Thomas Legge pointed out that while workers in factories went to their insurance practitioners when they became ill, there was no reciprocal provision in factories whereby, as a result of preventive measures in the individual case, the sickness claims which fell ultimately on insurance funds might be prevented from arising. The present duties of factory surgeons were to examine young people on entering employment, to examine

periodically the workers in certain dangerous or unhealthy industries, to examine and report on cases of industrial poisoning, and to grant certificates entitling workmen to compensation for scheduled diseases. In examining young persons in factories the surgeon was not required under the Factory Act to find out their deficiencies and rectify them; he had only to certify fitness or disablement. Probably not more than fifty factories in the country had a whole-time medical officer, and employers, in view of the contribution they already made under the Insurance Act, could hardly be expected to engage the services of such an officer. Even if they did so, objection would be raised on the part of trade unionists to accepting examination by a doctor paid by and (as they would think) working in the interests of the employer.

The witness was convinced that there was no chance of the creation of a new whole-time service of medical men as factory surgeons, and as a practicable alternative he supported some broadening of the National Health Insurance scheme whereby, in industrial areas, certain practitioners might be given, as their specific insurance work, the duty of keeping the industrial worker as far as possible from succumbing to illness, and so becoming a charge on insurance funds. He thought that both employers and trade unionists would welcome medical supervision in the factory by medical men for whose services both had contributed. Such a scheme of medical supervision which would involve the denial of employment to unfit men in certain factories, must be linked up with the employment exchanges, whose functions, he hoped, might also be broadened, so that such workers could have some suitable work found for them instead of being allowed to drift.

#### Medical Supervision in the Factory

The matters which would come under a proper system of medical supervision in the factory would be:

1. Initial detailed examination of all applicants for work.
2. Re-examination of such persons as the surgeon considered necessary, including periodical examination of the tuberculous and others with chronic illness.
3. Periodical examination of workers in dangerous processes.
4. Periodical inspection of first-aid and ambulance equipment.

In the course of oral examination, however, the witness receded from the first of these proposals, which he thought might be unattainable in practice as a compulsory measure, except as regards young persons. But he would welcome the submission of adults to voluntary examination, and he thought this might be forthcoming in view of the benefit in the way of advice which those who came forward would receive.

The witness deplored the fact that the relation of occupation to health should be excluded from the medical curriculum. "Men and women obtain their qualifications to practise as general practitioners without ever having had their attention called to the most important factor affecting the health of their patients—namely, occupation." He did not regard industrial hygiene as an entity in itself, but simply as a specialized part of general medicine and surgery, from which it could not properly be detached. He furnished statistics under the Workmen's Compensation Acts showing the long periods of disablement due to disease, contrasted with the shorter periods due to accident. It appeared that only one-third of the cases lasted for more than three months.

In reply to the Chairman (Sir Andrew Duncan) the witness said that it was because he felt so strongly that the insurance scheme was by far the greatest influence of a medical kind brought to bear upon persons employed in factories and workshops (comprising as it did every person employed, except those between 14 and 16 years of age) that he had brought the subject before the Commission. He described in detail the work of the certifying factory surgeons, and said that he wanted their work extended so that every factory and workshop should be in touch with a medical man specially entrusted with the duty of keeping watch over conditions of work in relation to health or conditions of health in relation to work.

#### Part-time Service Preferable.

Nearly all the present certifying factory surgeons were part-time officers who were engaged in general practice as well, and knew the factory workers in their own homes, although at present they were debarred from carrying out in the factory preventive medicine on clinical lines. His feeling was against whole-time service for this special work in factories. The practitioners employed should be in private practice, because private practice made them alert of mind and able to take quick decisions. "The worst of whole-time people is that they become drudges. They lose their initiative and their spirit. I like a person who is either connected with a hospital as a consultant, or who is doing private practice, for the work of a certifying surgeon." He was of opinion, however, that practitioners appointed to these part-time factory positions, if this was made a part of insurance administration, should not be in

ordinary insurance practice themselves in view of the difficulty which might arise as between the practitioner inside and the practitioner outside the factory. There must be no ground for the suspicion that the former was drawing patients to himself owing to his position in the factory. Each of the two practitioners should have his own sphere, one of them in the factory, where he could examine persons and refer them for treatment when necessary to their insurance practitioner with an indication of what he had discovered. The ideal was, of course, for every insurance practitioner to have the power of going into the factory or workshop and examining the conditions under which his patients worked, but as this might not be practicable he suggested a compromise whereby certain insurance practitioners would be specially selected to do this factory work—and no other insurance work—on behalf of the whole body.

In reply to Professor Alexander Grey, the witness said that in addition to the present certifying factory surgeon, whom he would desire to see taken over by the insurance administration to continue and extend the work he had been doing, he would have other medical men chosen by Local Medical Committees to undertake as their insurance practice supervision in factories. Asked how this would react on the remuneration of other practitioners, he said that he thought the expenditure of other practitioners of the considerable accumulations of surplus funds. The doctors selected should be paid according to the amount of time involved in the work; he would expect them to give up five mornings or afternoons a week. The number of factory workers assigned to a practitioner for his medical supervision might be as high as 25,000, so that if, say, there were 100,000 persons employed in the factories and workshops of Sheffield, there would be four of these special supervisors in that town. Factories scattered over rural areas would present a more difficult problem, but out of five million industrial workers four million were in big industrial districts.

#### Instruction in Occupational Hygiene.

Sir Thomas Legge went on to say, in answer to Sir Humphry Rolleston, that he was more and more convinced that the clinician was the person who was wanted in the factory, not the administrative officer merely. But although the certifying surgeon, under the system he had proposed, might find opportunity for clinical work in factories, his chief value there would be to stimulate the flow to insurance practitioners outside who were engaged solely in treatment, and thus the National Health Insurance scheme would be made more efficient as a means, not only of treating, but of forestalling disease. He did not accept Sir Humphry Rolleston's suggestion that insurance practitioners who took up this factory work might have their needs met by a post-graduate course on occupational hygiene provided by the Ministry of Health. He wanted the instruction to be in the student's curriculum. It might be that only a small proportion of those entering the profession would be occupied with factory work proper, but all in general practice were likely to come across patients suffering from strain due in some way or other to employment. He agreed that the problems of occupational ill health were just as important in regard to other occupations not carried on in factories, such as mining and constructional work, but he was not in a position to speak for these others.

Questioned with regard to the objection he had expressed to handing over factory administration to officials responsible to local authorities and not to a central department, the witness said that the local health authority could hardly ever have the requisite knowledge of the conditions obtaining in the great variety of industries and processes now followed, only a fraction of which could be brought in any one single locality. The Chairman remarked that the Commission had had in evidence strong recommendations that all the medical services of a given locality should be brought under the control of one health authority. The witness agreed that if effective co-operation could be brought about this was a consummation devoutly to be wished. It would mean a new creation of the local health authority, co-ordinating and equalizing the National Health Insurance service, the activities of the medical officer of health and any other services under central authorities. With regard to the factory part of the work, he would be content to leave to the Ministry of Health the arrangements for the control which he considered to be essential.

#### LONDON INSURANCE COMMITTEE.

*Medical Service Subcommittee.*  
At the meeting of the London Insurance Committee on April 23rd the Medical Service Subcommittee, which had suspended its labours for some months owing to a dispute in connexion with the chairmanship, showed that it had begun to function again by the chairmen on seven cases. In two of these the complaints against the practitioners were not substantiated, in three others it was found that the practitioners in each case had committed a breach of the medical certification rules, for which they should be cautioned, and

in the two remaining cases the new course was proposed of referring them to the recently appointed Ethical Subcommittee of the Panel Committee. In one of these cases, concerning the refusal of a practitioner to afford treatment, there were technical difficulties in the way of Insurance Committee procedure, first because the complaint had not been made within the specified period, and secondly, because the insured person was in a state of health which made it undesirable to trouble her in the matter. The second case consisted of an allegation that the practitioner had made certain remarks to the relatives of the patient about his remuneration as an insurance practitioner, asking them how they would like to visit patients at a late hour for 9s. a year. When the case came before the full Committee, however, objection was taken to referring these matters to an outside body, and the matter was referred back.

#### Statistics of Medical Benefit.

It was reported that the cost of prescriptions for insulin supplied to insured persons in London during the year 1924 was £1,621. During the second half of the same year the cost of prescriptions issued to insured persons for serums and vaccines was £144. Statistical data in respect of prescriptions issued by practitioners in five or six of the metropolitan boroughs (selected by the Ministry of Health) are furnished to the Ministry every month to enable a selection to be made of those practitioners on whose prescriptions a complete report is desired. It was stated that during the last six months of 1924 reports were prepared on the prescribing of 233 practitioners. This preliminary survey is still proceeding.

### Correspondence.

#### The Liberties of the Profession.

SIR,—The problem is this: how to secure for doctors who work under the Insurance Acts the liberties of ordinary citizens. The Acts as they stand confer on the Minister disciplinary powers from which there is no appeal. The Acts admit of regulations being made which have this effect.

The theory of the Ministry is that the Minister's responsibility to Parliament for the efficiency of the service involves this absolute power. They hold that it is a constitutional necessity that he, as paymaster of the doctors, responsible for the spending of national funds, should have the right to (a) fine them, (b) dismiss them from the panel, without appeal.

In Cheshire we do not see the necessity, and our view was focused in the motion at the joint Conference (SUPPLEMENT, March 21st, p. 116) claiming that an appeal should be made possible against the decision of the Minister to the courts of law.

It is strange that Dr. Brackenbury should state so absolutely that the Insurance Acts Committee has "always" taken a view of this matter contrary to that of Cheshire in face of the following passages in the report of the Insurance Acts Committee to the Conference of Panel Committees in the autumn of 1921: "It must be recognized that the Minister is charged by Parliament with the duty of seeing that the medical service under the Insurance Acts is efficient, and that therefore his must be the authority which actually imposes penalties for inefficient service in any area or even removes from the service in certain cases those who have improperly conducted it. The question is whether there is sufficient check upon arbitrary or unjust action by the Minister, and, if not, what suitable check can be suggested. . . . In the case of removal from the panel the Conference has asked that there should be a further check—the right of appeal to the High Court within three months of the decision of the Minister." The report continues with a doubt whether the right, if granted, would be exercised in cases of the nature hitherto dealt with, and states that none the less the Insurance Acts Committee had made efforts to get the right embodied in an amendment to a parliamentary bill.

Dr. Brackenbury and the Evidence Committee now say, in effect, "Yes, let us ask the Royal Commission to advise Parliament to give us this right of appeal; but let us only ask for it to be in mitigation of the penalty. Whatever we do, let us not ask for the merits of the case to be reopened before the courts. Let us ask to be allowed to plead for punishment to be reduced, but not to plead against any punishment at all. To do the latter (say Dr. Brackenbury and his school of thought) would be dangerous and unconstitutional."

Dr. Garratt in his closely reasoned letter in the SUPPLEMENT of April 18th has dealt with both those argu-

ments. He thinks that the potential right of access to the courts would be a deterrent to the initiation of complaints, and he, rightly, does not fear it. The menace Dr. Brackenbury sees seems unsubstantial, for no important new powers of litigation would be conferred on patients which they do not enjoy now. A panel doctor is to-day liable for an action for malpraxis to be brought against him. But a doctor who was fined £5 for supposed delay in diagnosing that a case of Vincent's angina was complicated by diphtheria (to take an illustration from recent events) would, were the reform now proposed made, be able to have his case tried by a court accustomed to the rules of evidence, and not decided finally, out of hand, by a Minister who quotes, and ignores, his own chosen and official advisers, and then acts on the "advice" of some other person or persons unknown.

The gain of such a right of appeal seems to us very substantial. However seldom it was exercised, the fact of its existence would be an invaluable safeguard of our liberty. The menace in it which Dr. Brackenbury sees seems unsubstantial, as I have said; but at the Conference, with his accustomed skill, he used it with effect: "I want to make your flesh creep," he seemed to say, lifting the corner of a curtain . . . of apparently endless litigation . . . patients and distracted doctors. I am glad to read in Dr. Garratt's letter (SUPPLEMENT, April 18th) that that vision "daunts him not at all"; nor will it daunt anyone who realizes that whilst the proposed reform would give us justice, it would add nothing to our patients' present full opportunities of obtaining justice; nay, it would even deter the litigious.

The claim is constantly being made that the panel doctor should treat his panel patients in the same way as he treats his private patients, and that the conditions of insurance practice should be made as much like those of private practice as possible. It is the last thing the approved societies as a whole want, or that the public is supposed to want, that doctors should become State servants. Yet the Ministry seems to say: "As between patient and doctor the relations should be those obtaining in private practice; but in the matter of contract you are under the Insurance Committee who pays you; whilst, when it comes to discipline, you are neither under the patient who chooses you, nor under the Insurance Committee who contracts with you and pays you, but you are under us, the Ministry, who hold you in the hollow of our hand; and, if we have an extension of the insurance scheme to dependents, we shall then be able to make or break you as we think fit, for practically all the patients of many of you and the majority of the patients of most of you will be panel patients, and we can fine you as we like for giving your patients the same prescriptions you give your private patients, if we consider them extravagant, and for anything else whatever. We can accumulate a dossier of your misdeeds and bring the tale of them up against you. We can put you off the panel when we think fit, and that will mean for all of you whose practice lies mainly amongst the industrial classes that your licence to practise, given you by the General Medical Council, will be virtually cancelled, and you will have no appeal to the General Medical Council or to anybody else, not even to the courts of law."

Panel doctors are private doctors whose financial relations with their patients have been subjected to State control. That need not take them out of the jurisdiction of the courts. The curtailment of the liberty of medical citizens is, we claim, unconstitutional and contrary to the spirit of English law. If, as Dr. Brackenbury suggests, it is unconstitutional for the question whether a contract has been fulfilled or not to be tested in a court of law, it is a very strange England in which we live.—I am, etc.,  
Holmes Chapel, Cheshire, April 21st. LIONEL JAMES PICTON.

SIR,—With reference to the case of the panel practitioner who was acquitted and fined for making a late diagnosis of diphtheria in a complicated case of septic tonsillitis and Vincent's angina, a recent experience in my own practice may not be without interest.

A young lady, convalescent after an attack of influenza and bronchitis, went for a long ride on an omnibus and caught a severe

chill. This caused a stomatitis with a number of small ulcers on the gums and inner sides of the cheeks. By the third day a nasty slough had formed behind the upper central incisors, and a very foul condition of her gums and mouth generally followed. Her temperature rose to 104°, there was great swelling of the submaxillary and cervical glands, and she was very ill. A diagnosis of Vincent's angina was made, and after some delay, on account of the week no swab was taken before sending her. As it was the end of the week after admission I was greatly surprised and perturbed when informed that Klebs-Loeffler bacilli had been found, and that she was being transferred to a fever hospital. I got into communication with the medical officer of the fever hospital and gave him a history of the case. Swabs were immediately taken and examined, and I was later informed that Klebs-Loeffler bacilli could not be found, and that my diagnosis of Vincent's angina was correct. The patient made a good recovery.

Now the point is this, that a mistake had been made by an eminent bacteriologist in some way or other, and much anxiety caused to the patient, her friends, the hospital, and myself. The patient was a panel patient, but no charge of negligence was preferred against me, otherwise I know what would have happened at the Insurance Committee and the Ministry of Health. From one personal experience (though not on any charge of negligence) and from the numerous reports of proceedings, there is no doubt that the attitude of the officials of the Ministry of Health is distinctly antagonistic to the profession, and in some cases decidedly vindictive, as I myself found. There will be no peace in the profession until an end is made of this sort of thing, and the vindictive spirit killed. We all make mistakes—some of the worst I have seen were made by the most eminent members of our profession—but it appears now that the humble panel practitioner is to be made the sole target for the spite of a big Government department. The judge who tried the Harriott case was not removed from the bench for his grave error of judgement, then why should a medical practitioner be removed from the panel by a lay tribunal who do not understand his difficulties?

Some solution of the problem of dealing with charges brought against the panel practitioner must be found. Personally, I made up my mind after the treatment meted out to me at the Insurance Committee and the Ministry of Health, that in no circumstance would I again appear before them—my resignation would precede this. Fortunately, after twenty-five years of good practice I am in a position to do this, and fortunately also my panel is small; but there are very many of our profession who depend almost entirely on their panel practices for their daily bread, and it is in their interest that I have been constrained to write this letter.—I am, etc.,

March 20th.

## DISGUSTED.

## Nursing Homes (Registration) Bill.

Sir,—May I use your columns to draw the attention of the profession—more particularly consultants and those who receive one or more patients into their private houses—to this bill? This bill has had its first reading: it is supported by the College of Nursing and Colonel Fremantle, M.P. (late M.O.H.), amongst others; and they are now urging that it should be adopted as a Government measure. In its present form it would extend into the private houses of doctors the inquisitorial supervision and disciplinary regulations of the Ministry of Health, with consequential inquiries, fines, and penalties, so well known to insurance practitioners in their domiciliary practice. It is also another instance of proposed legislation by regulations.

The definition of a nursing home is "any premises . . . for the reception of . . . persons suffering from any sickness injury or infirmity for the purpose of the provision of such persons with . . . food either with or without medical . . . aid where any payment . . . is made." This definition includes—and, I have been informed, is intended to include—doctors who receive patients of any kind.

Patients who are placed, or place themselves, under the care of a doctor, desiring to be associated in the home life, are readily divided into four groups—namely, certified, "border-line," drug addicts, and those suffering from chronic forms of illness more peculiarly affecting the aged. Every doctor who receives any such patient would be subjected to the conditions outlined in this bill if it passes in its present form. These conditions include determination by the Minister of Health:

- (a) Whether the doctor is a suitable person to receive one or more patients.
- (b) Whether the nurses and servants he has engaged are suitable.

- (c) Whether the lighting, heating, ventilation, and sanitary state of the accommodation is satisfactory for the patients, nurses, and servants.
- (d) Whether the house is properly equipped for patients.

(e) The exact prominent position in the house where a copy of the regulations shall be displayed for all to read; as also the exact position inside and outside the house where a notice shall be placed that the house is a "registered nursing home."

Also the medical officer of health or an appointed State registered nurse, at reasonable hours, can call to inspect the whole house, the entries and records in the registers of patients; of transfers and discharges; of deaths; of clinical records; of dispensing done; of casualties and the reports required to be made from time to time.

Now, the whole object of receiving these patients into a doctor's house is to provide for them the privacy and atmosphere of a home whilst ensuring that care and supervision by a doctor which is necessary if any improvement in their health is to be hoped for. If this bill goes through in its present form then consultants and private practitioners will find themselves deprived of just those non-institutionally conducted homes which these patients require; for there can be no question that private practitioners who at present receive these patients will refuse absolutely to place their homes, themselves, and their families in a position to be dragged by a State organization. That result would be against the interests of the public, the patients concerned, the relatives, and the medical profession generally. It has been said—and by doctors—that if the notice-board outside the house is done away with there is nothing else to object to! This shows lack of vision. Also, that doctors must not expect to be treated differently from any lay person who may decide to open a home. Surely the profession is sufficiently dominated at the present moment by the State. Will it timely allow this further proposal?

Might I urge all interested to read the bill at once, and then to communicate their views to their member of Parliament, the British Medical Association, as well as to any others whose influence could be brought to bear in order that the members of the medical profession who receive private patients be excluded from the operations of this bill? Unless this condition is secured the bill should be opposed with all the power still left to us. There is no time to be lost.—I am, etc.,

Now, April 25th.

\* \* This matter was raised by Dr. Fothergill at the last meeting of the Council of the British Medical Association (see SUPPLEMENT, April 4th, p. 133).

E. ROWLAND FOTHERGILL.

## Insurance Remuneration.

Sir,—During the recent discussions on the proposed extension of the Insurance Act there is one point which seems to have received insufficient consideration, and among the advocates of such extension to have been entirely neglected. I refer to the undoubted fact that the insurance doctor to-day is much worse off than at the commencement of the Act. To those of us who have been panel doctors since the beginning this statement will need no proof, but for the younger members of our profession I may give the following summary.

**Payment.**—We all know, to our cost, that 9s. to-day is considerably below the value of the original 7s.

**Work.**—This has been increased by (1) artificial causes, such as reports to regional medical and tuberculosis officers, certificates to employers; (2) the emergency treatment obligation; (3) obligation to treat tuberculous patients. Many of these were originally treated at the tuberculosis dispensaries by the tuberculosis officer. (2) **Natural:** (a) At the commencement of the Act all insured persons were workers; now in the course of time, by reason of age or illness, many have become chronic invalids; (b) the war caused a marked deterioration in the health of many men who served; (c) apparently we have to reckon on a yearly epidemic of influenza; (d) I think there is an increased tendency to call on the panel doctor's services, especially for very minor ailments.

All this should make us pause. Our position has deteriorated, and seems likely to become worse. Would it not have been well to make this clear when giving evidence before the Royal Commission before rushing in with all sorts of ill considered proposals for an extension of medical benefit to insured persons and their dependants?—I am, etc.,

Worcester, April 19th.

-W. G. BENNETT.

## Lay Control.

Sir,—In the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of April 11th it was reported that the West Ham Board of Guardians required all applicants for appointments to join a trade union. An advertisement to this effect was sent to the JOURNAL by the guardians, who were informed that it could not

R. M. Russell.

Drs. P. F. Lunan, Senior M.O., and F. R. Lockhart, M.O., Tanganyika transferred from Dar es Salaam to Tukuyu and Dodoma respectively. Dr. E. A. Nefi appointed Medical Superintendent and District Commissioner Makogai; Fijl

where full particulars will be found. To ensure notice in this column advertisements must be received not later than the first post on Tuesday morning.

Printed and published by the British Medical Association, at their Office, No. 429, Strand, in the Parish of St. Martin-in-the-Fields, in the County of London.

### British Medical Association.

#### CURRENT NOTES.

**Bacteriologist and Pathologist for the County of Lanark.**  
The Lanark County Council recently tendered an advertisement for a bacteriologist and pathologist, offering a salary of £600. It was pointed out to the clerk of the council that the salary offered was not in accordance with the new salaries scale, and that a medical man of sufficient attainments to fill the important and responsible post of bacteriologist and pathologist to a county should receive a considerably higher salary. It is most satisfactory to be able to record that as a result of this representation an amended advertisement has been tendered offering the scale salary of £750, and it appears in this week's issue of the JOURNAL. Several intending applicants wrote to the Medical Secretary of the British Medical Association inquiring what the objections were to the salary, as they had seen the advertisement appearing in the lay press. As a result of the information supplied they withheld their applications, and they will be gratified to know now that their sacrifice has not been made in vain. The Lanark County Council is to be commended for the action it has taken in this matter.

#### Flags for the Great Hall.

To the list of those areas in which Annual Meetings of the British Medical Association have been held which have promised to contribute a flag for the Great Hall of the new House of the Association must now be added Edinburgh, Bradford, and Swansea.

### SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

#### SCHOLARSHIPS.

The Council of the British Medical Association is prepared to receive applications for Research Scholarships, as follows:

1. An ERNEST HART MEMORIAL SCHOLARSHIP, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. THREE RESEARCH SCHOLARSHIPS, each of the value of £150 per annum, for research into some subject relating to the Causation, Prevention, or Treatment of Disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1925. A Scholar may be reappointed for not more than two additional terms. A Scholar may hold a junior appointment at a University, Medical School, or Hospital provided the duties of such appointment do not interfere with his work as a Scholar.

The conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

#### GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the Causation, Prevention, or Treatment of Disease. Preference will be given, other things being equal, to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

#### Applications.

Applications for Scholarships and Grants for the year 1925-26 must be made not later than Saturday, June 6th, 1925, on the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated to whom reference may be made.

March 21st, 1925.

ALFRED COX, Medical Secretary.

### Association Notices.

#### BRANCH AND DIVISION MEETINGS TO BE HELD.

**BIRMINGHAM BRANCH: COVENTRY DIVISION.**—The annual meeting of the Coventry Division will be held on Tuesday, May 19th, at 8.30 p.m., at the Coventry and Warwickshire Hospital. Agenda: Correspondence; election of officers; Local Hospital Committee; Annual Report of Council. Dr. Rollason will propose that ladies may be invited to the annual dinner.

**BIRMINGHAM BRANCH: NUNEATON AND TAMWORTH DIVISION.**—By courtesy of the Warwickshire and Coventry Joint Committee for Tuberculosis, a meeting of the Division will be held at the Warwickshire King Edward VII Memorial Sanatorium on Wednesday, May 13th, at 3 p.m. The members will be conducted round the sanatorium by the medical staff. There will then be a short meeting of the Division to elect a Representative and Deputy Representative for 1925-26, to discuss arrangements for annual dinner, and to transact any other business. After the meeting the members will be entertained to tea by the matron. The sanatorium lies near the main road between Warwick and Birmingham, about 2½ miles from Warwick and near the County Asylum.

**GLASGOW AND WEST OF SCOTLAND BRANCH.**—The annual general meeting of the Glasgow and West of Scotland Branch will be held in the Lecture Room of the Physiological Department, Glasgow University, on Wednesday, May 20th, at 3 p.m. The annual report will be submitted and the election of office-bearers for the ensuing year will take place. At 4 p.m. Professor E. P. Cathcart, C.B.E., M.D., F.R.S., will deliver an address on diet in relation to health.

**KENT BRANCH: DARTFORD DIVISION.**—The annual meeting of the Dartford Division will be held at the Livingstone Hospital, Dartford, to-day (Friday, May 8th), at 3 p.m. Business: Correspondence; balance sheet and report for 1924; voluntary entertainment fund; consider Annual Report of Council; election of officers for ensuing year; Kent county midwifery fees.

**KENT BRANCH: ISLE OF THANET DIVISION.**—The annual meeting of the Isle of Thanet Division will be held at the Commercial Hotel, Hardres Street, Ramsgate, on Friday, May 15th, at 4 p.m., when Dr. H. M. Raven will take the chair. Agenda: Election of officers; revision of Divisional Rules; discussion on the Annual Report of Council. Dr. G. C. Anderson (Deputy Medical Secretary of the Association) will attend and speak on current affairs.

**METROPOLITAN COUNTIES BRANCH: CITY DIVISION.**—A meeting of the City Division will be held at the Metropolitan Hospital, Kingsland Road, on Tuesday, May 12th, at 9.30 p.m., when a paper will be read by Dr. A. Westerman, chairman of the Division.

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.**—The annual meeting of the Lewisham Division will be held at the Parish Room, St. Laurence Vicarage, Catford, S.E.6, on Tuesday, May 19th, at 8.45 p.m., when an address will be delivered by Dr. James Neal, secretary of the Medical Defence Union.

**METROPOLITAN COUNTIES BRANCH: MARYLEBONE DIVISION.**—The annual general meeting of the Marylebone Division will be held at 11, Chandos Street, W.1, to-day (Friday, May 8th), at 8.30 p.m., for the election of officers and representatives and nominations to the Branch Council. A discussion on the Annual Report of Council will also take place.

**ASSOCIATION INTER-APPOINTMENTS.**

GROTT, John Lewis, M.C., F.R.C.S. Edin., M.R.C.S. Eng., L.H. Cert. Lond., Honorary Radiologist and Physician in charge of the Electro-Therapeutic Department, Sheffield Royal Hospital.  
PADDINGTON GREEN CUNYMEY'S HOSPITAL.—House-Surgeon—  
M.B., Ch.M. Syd. House-Surgeon—Ralph Morton, M.D., Ch.R. Edin.

## Royal Commission on National Health Insurance.

### EVIDENCE GIVEN BY REPRESENTATIVES OF THE BRITISH MEDICAL ASSOCIATION.

THE witnesses on behalf of the British Medical Association were heard by the Royal Commission on National Health Insurance on Thursdays, April 30th and May 7th.

At the twenty-sixth meeting of the Royal Commission, held on April 30th, Dr. R. A. Bolam, Dr. H. B. Brackenbury, Dr. H. Guy Dain, Dr. Alfred Cox, and Dr. H. J. Cardale were called and examined. The members of the Royal Commission present were Sir Andrew Duncan (in the chair), the Right Hon. Sir John Anderson, G.C.B., Sir Humphry Rolleston, Bt., K.C.B., M.D., P.R.C.P., Sir Arthur Worley, C.B.E., Mr. James Cook, J.P., Mr. John Evans, Professor Alexander Gray, Mr. William Jones, Mrs. Harrison Bell, and Miss Gertrude Tuckwell.

The Commissioners had before them the Association's Memorandum of Evidence, the revised draft of which appeared in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of February 28th, 1925 (pp. 69-78); also copies of

the Hospital Policy of the British Medical Association (published in the SUPPLEMENT of various dates and since reproduced in pamphlet form by the Association). The two documents are reprinted as appendices to the oral evidence taken on April 30th, which has now been published by H.M. Stationery Office, Adastral House, Kingsway, W.C.2, price 3s. net, postage extra.

The following subjects were dealt with at this session: The quality of the medical services given under the panel system, the conditions to be satisfied by a public service under the health insurance scheme, the range of persons to be included within the scheme, extension of scope of medical service, co-ordination of existing services, and the arguments against a salaried medical service.

We publish below the full text of the oral evidence given by the witnesses on behalf of the British Medical Association at the meeting on April 30th. The evidence given on May 7th will appear in our next issue.

### MINUTES OF EVIDENCE, APRIL 30TH, 1925.\*

*Chairman:* Dr. Bolam, Lord Lawrence, the Chairman of the Commission, asked me to explain that he is indisposed and unable to be here to-day.—*Dr. Bolam:* We much regret that, Sir.

But he hopes to be present next Thursday. You are Chairman of the Council of the British Medical Association?—*I am.*

I understand that you are not yourself an insurance practitioner and have not been such at any time?—*No, never.*

Dr. Brackenbury, you are Chairman of the Representative Body of the British Medical Association?—*Dr. Brackenbury:* Yes.

I understand that you are yourself engaged in practice under the National Health Insurance Acts, and that you are Chairman of the Middlesex Panel Committee?—*Yes. I was Chairman of the Insurance Acts Committee from 1915 till last November.*

Dr. Dain, you are Chairman of the Insurance Acts Committee of the Association, and Chairman also of the Birmingham Panel Committee, and you, like Dr. Brackenbury, are, I believe, engaged in insurance practice?—*Dr. Dain:* Yes.

And you, Dr. Cox, are Medical Secretary of the British Medical Association?—*Dr. Cox:* Yes.

I suppose that you are not now in practice, either under the Insurance Acts or otherwise?—*No, I had over twenty years' experience in general practice before I took my present post.*

If it meets your convenience, Dr. Bolam, we will take the evidence in parts. I have a number of questions to put from the chair, and my colleagues all have questions in addition that they desire to ask. You are submitting to us on behalf of the British Medical Association the Statement which we have before us. May

I take it from Part I (a) of that Statement that your Association with its 19,000 members in Great Britain is thoroughly representative, not only of the general practitioners, but also of all sections of the medical profession?—*Dr. Bolam:* You may take it so, Sir.

And from the description of procedure in Part I (a) we may conclude that these proposals have been thoroughly discussed by the medical profession throughout the country, and that what you submit to us embodies the representative opinion of the profession?—*We have taken the very greatest pains to ascertain the profession's opinion so far as it can be ascertained.*

From Part I (b) we may take it, may we, that these proposals are also approved by the 12,000 insurance practitioners regarded as a large and important class within the medical profession?—*Their authorized representatives were present and constituted a great part of the final meeting which ratified the Memorandum.*

Could you indicate to us the nature and size of any medical bodies which you do not represent to whose evidence we shall have to give attention? In other words, we want a friendly warning as to what your Association and your Statement do not cover. You may put it as generally as you like.—*You put us in a difficult position. If I may say so, every association, with the sole exception perhaps of one very small association, which might wish to make any representations to you beyond ourselves is also very largely represented within our Association. There*

\* Reproduced by permission of the Controller of H.M. Stationery Office.

are probably not more than 1,500 or 2,000 medical men in any form of medico-political organization outside of our Association; that is to say, so far as the profession is organized we represent at least nine-tenths of it, and the other organizations have had their opportunity through their individual members, and in some cases by special representation and co-optation, of making their impression upon our evidence as submitted to you.

Can you tell us whether, at the special Conference on March 12th, 1925, at which your Memorandum was adopted, there was any considerable minority of representatives who did not approve of the main recommendations contained in the Memorandum?—**Dr. Brackenbury:** There are only two points which might be considered main points upon which there was any difference of opinion. One was the important point of the inclusion of dependants. In our paragraph 13 we note the two divergent opinions, one, that it was very doubtful whether dependants, even on the lines we indicate, should be included, and another, but smaller volume of opinion, that one of the most urgent things was to include them. The other point is important, but a smaller one. There was a considerable minority at the Conference who thought we ought to ask for an appeal to the Courts of Law on all grounds instead of on some grounds, as we say in our Statement. These are the only points, are they?—Those were the only points on which there was any definite difference.

In Part II, paragraphs 2 and 9, of your Statement, you describe what, in your view, should be the organization and finance of the National Scheme of Health Insurance, so far as medical services are concerned, and the relationship of such a scheme to the other health services, public and voluntary. I take it that you lay considerable stress on establishing and strengthening that relationship?—That is so, but I should like to say we have not gone very far in describing what we believe should be the finance of a National Scheme of Health Insurance.

With that reservation which you make we accept the answer. Apart from your proposed change in the character of the local administrative body, your recommendations are generally in the direction of continuance of the present scheme, with contractions in certain directions and extensions in others?—That is so. From paragraphs 2 and 5 I gather that while a National Health Insurance Scheme is, in your opinion, not necessarily the best means of utilizing limited resources for the promotion of national health, at the same time you feel that the experience since 1912 justifies you in recommending a continuance and improvement of the insurance system?—Yes.

You came to this conclusion in 1922. Has the last two years' experience confirmed this view?—Yes, definitely. I note your statement in paragraph 5 that at the beginning of National Health Insurance a large proportion of professional opinion was antagonistic to the system, or to some of its important details, and that this antagonism was shared by sections of the insured population. I gather that you are of opinion that this antagonism has become less as time has gone on. Can you point to any evidence of this?—On the professional side there are two things, one, the considerable (as I think it is) increase in the number of insurance practitioners, those who are willing to take part in the service.

Could you give us the figures as to that increase?—No, I have not got them, but it has been very marked during the present year, I understand, and secondly the fact that we discovered in our medico-political activities that what was in some sections of the profession active antagonism might now be described rather as indifference than antagonism to the principles of the Health Insurance Scheme. Then on the insured persons' side we have, as persons are much more willing to come to us and to take advantage of their opportunities instead of exhibiting prejudice, or making the remark that they came unwillingly, that we used to find at the beginning of the period.

We are much interested in this summary of results which you give in paragraph 6. You have come to the conclusion *inter alia* that large numbers of persons are now receiving medical attention which they formerly did not receive; and that the amount and character of the medical attention is superior to that formerly given in the best of the old clubs, and immensely superior to that given in the great majority of these clubs. May we take it, then, as your considered opinion that there have been immense gains to national health resulting from the 12 years' operation of the Scheme?—That depends on exactly what is meant by "immense gains to national health." I do not think we are in a position to indicate, to prove at all events, that there has been an immense gain in the national health of the nation. The thing has scarcely been working long enough, or working under normal conditions long enough, for us to be able to prove that. But we do point to the evidence as to the incidence of sickness benefit does reduced national sickness, and we are quite sure that if the comfort of the individual health includes 'immense gain' to the attention whenever he needs it, the gain is most marked; but if you mean statistical evidence that the health of the nation has actually improved, we are not in a position to bring forward any evidence that that is so.

I was really quoting the words "immense gains" from your paragraph 6.—**Dr. Rolam:** We do not claim that for national health exactly, Sir. There are gains, but we do not specify them.

Gains to the population?—Gains to the individual, to the profession, and incidentally to the national health. Can you amplify and illustrate the statement in paragraph 6 that the work of practitioners has been given a bias towards prevention which was formerly not so marked?—That, of course, would be a gain also?—**Dr. Brackenbury:** Yes. But we do not

claim that the whole increased bias towards prevention is due to National Health Insurance. We think generally that there has been an awakening to the fact that prevention is, after all, the important thing in the whole matter of health, but here we have a scheme which brings people to us early with increasing questions to advice, how they can keep well. That has been a marked feature of our experience as insurance practitioners, and we shall gain financially—though that is not always before us—if the patient is well enough not to have to come to us. The fact that people are coming to us in the early stages of disease has directed our attention more than was formerly the case to those early stages, and that is directly preventive in its effects. Do you find that they come in larger numbers for general over-haul or inspection?—Larger than they did a few years ago. That is increasing, is it?—Yes.

Would you say that there is any truth in the statement we sometimes hear that the service given under medical benefit is inferior in sympathy and quality to that given by the same practitioners in their private practice, or to that given by practitioners in corresponding qualifications who are entirely in private practice?—I should say there is no truth in it at all.

Do you think that the insurance practitioners as a class give their professional best to the insured persons, though such service is given under a contract and paid by capitation and is under a certain degree of State regulation?—In spite of those three things I am sure it is a fact that each doctor in relation to his own patients does give of his professional best.

And in no sense because of it?—No. **Dr. Cox:** There is an additional point I should like to make on that. Not only do they give their professional best because it is a professional tradition, and career to the moment they leave it, but this system has given the medical profession itself a greater control over the service than it ever had before under any collective system, and it has given it an increased interest in the success of the system. This is a very marked feature of our insurance scheme as against any insurance scheme that I know of anywhere else.

**Sir Humphry Rolleston:** On that, if I might put a supplementary question, I should like to know whether there is any difference between the conditions in London and elsewhere. It has been put to us that in London there are more complaints with regard to unsatisfactory treatment on the part of the panel practitioner than there are in other parts.—**Dr. Rolam:** We have here a well known representative of London, **Dr. Cardale:** if it is the pleasure of the Commission to hear first-hand evidence in regard to that, **Chairman:** I think we should be pleased as a Commission to hear first-hand evidence. We have had evidence rather indicating, as **Sir Humphry** has said, that there are more complaints in London than elsewhere.

What is your connexion with the Scheme, **Dr. Cardale?**—**Dr. Cardale:** I am an insurance practitioner myself, and I have for eleven years been Chairman of the London Panel Committee and for other bodies connected with insurance work. No doubt you have read the evidence of some of the witnesses who have already appeared before the Commission?—I have.

It probably is not necessary for me to put the questions specifically to you, you have in mind the general tenor of them?—Yes. We shall be glad to hear what you have to say about it.—**Dr. Cardale:** Speaking with regard to the service in London in general, I think it is a very good service. With regard to the matter of the number of complaints in London as compared with other parts of the country, I have tried to get some figures, but I have found it very difficult to make comparisons. I can give you the number of complaints in London itself and compare that with the number of practitioners practising under the Insurance Act in London and the estimated number of attendances given to insured persons because I think perhaps the fairest way to estimate the complaints is to compare them with the attendances, since every attendance is a potential cause of complaint. We have at present on the London panel 1,772 practitioners; of those 97 are in institutions. With regard to the number of complaints, for the year 1924 we had 87 complaints all told, and of these one practitioner was concerned in three cases and six practitioners in two cases; so there would not be 87 separate practitioners involved.

Is that 87 cases before the Insurance Committee?—Eighty-seven complaints of all kinds brought before the Medical Service Sub-committee. Of those, 32 cases were not substantiated, and, of course, the cause of complaint is very varied; for example, there are complaints with regard to service, with regard to unsatisfactory issue of prescriptions, illegible prescriptions, the keeping of records, failure to provide treatment, conduct, unsatisfactory arrangements for conduct of practice, alleged intoxication—only one case of that, and that was not substantiated, I might say. So that when you come to divide these cases up you find that the nature of the complaints is of a very varied character, only a proportion of them being directed against the actual conduct of the practitioners. It is very difficult to say exactly how many attendances are given in a year. There are, perhaps, two ways of coming to a rough estimate. One is by taking the number of prescriptions issued in London. Of course each prescription necessarily means an attendance. In addition to that there are attendances for which no prescription is issued. On the other hand, of those prescriptions where there are two definite prescriptions on one form they would be counted as two. Those would about balance the other type of case. The number of prescriptions in the year 1924 was 6,656,766, and if you work that out as a percentage of substantiated complaints to attendances, it works out at 0.00003994.

Apart from specific complaints made to the Medical Service Sub-committee, is there in your view any foundation for the very vague and general statement that there is wide

discontent on the part of insured people in London?—No, I do not think so. I think, taking the insured people as a whole, they are now well contented.

Can you account in any way for responsible people furthering and repeating a statement of the kind I have just mentioned?—I do not think there is any widespread discontent. I do not say there is no discontent. I could not go that length. Undoubtedly perhaps an insured person will have some little grouse against his doctor and talk it over with the agent of the Approved Society.

Is there any possible explanation of the fact that witnesses have been prepared to say that, taking the country as a whole, they do not find any longer any general feeling of complaint, but that as regards London they do find such a feeling? How would you yourself account for a statement of that sort?—The only way is this. London is very largely the centre of all insurance work, and the press in London is much more active and they are very fond of getting hold of little stunts about insurance work, and any complaints that there are are very much better advertised in London than they are anywhere else.

That is tantamount to saying that the other places are just as bad, but they have not been found out. I am afraid that is not quite the explanation.—No, that is not quite the way in which I should put it. I should put it the other way about.

What is the other way about?—That everywhere there is a very small amount of discontent, but it comes to the surface and is more advertised and becomes more public in London than anywhere else, though I do not think the total amount of discontent in London with the service is greater than anywhere else.

One knows quite well from one's general experience that the Act was born in an atmosphere of antagonism, not only in the medical profession but in the general public mind, and it certainly would take time for that to die down?—Yes.

Is it possible that has died down much more quickly outside of London than in London?—I do not think so. In my own experience at the beginning of the Act quite a number of insured persons would come and refuse to be treated under the Act. I had several most obstinate persons in that respect, but I have not one now. I used to have quite serious trouble with them; now I have not any. It seems to me, certainly in my own district, that the discontent has almost entirely died down. It is very seldom that I hear now a man saying he does not like the Act and will not have anything to do with it.

Is it not possible, from the very nature of the structure of London and the difficulty of neighbours being compact in any sense, that there is less chance of the medical profession being able to bring their own impress to bear on the public they serve than there is in the country? Might it arise from something of that kind?—It might do. You mean its patients are moving about more and are not attached to one medical man in London?

Partly that, but partly also this: in a country place supposing one is inclined to be a little bit dissatisfied with one's doctor, one may hear another speak well of him, and one may say: "Well, probably I was myself to blame," but you do not have that kind of feeling in a London community to the same extent?—Possibly not to the same extent.

Might it arise partly from that?—It might partly. Dr. Bolam: I should like to tell you, Sir, Dr. Brackenbury also is in a position to speak with regard to London.

What do you say, Dr. Brackenbury?—Dr. Brackenbury: I am just outside London proper. What occurs to me as an explanation of the statement is that the proportion of general practitioners doing insurance work in London is materially lower than the proportion of general practitioners doing insurance work in any other place, except possibly Edinburgh. London and Edinburgh were very largely the centres of the organized or expressed antagonism to the Act at the beginning; and when you have a large body, a considerable proportion, of general practitioners who are not working the Act and who have, those of them who passed through the stage of 1911, 1912, and 1913, still got the feeling that they had then, it is quite likely that any general statements made which, as Dr. Cardale has said, more easily get published in London, will be more detrimental to the working of the Act, whether or no they have any foundation in fact.

Do you mean that where you have a large section of the profession not themselves engaged in insurance practice they may give support, or create an atmosphere that gives support, to statements which may react against the panel side?—Not so much actively as passively, and where there is that there is likely to be a different atmosphere than where 100 per cent. of the general practitioners are themselves on the panel. Then, again, it seems to me that in London we have many insured persons concentrated, much more largely than in any other place, who are clerical workers or insured persons who are on the margin and who, in a few years' time, will be going out of insurance, and we find that that is the class of person who complains more about the working of the Act than any other, not really from facts but from prejudice; impressions derived from secondhand sources if you like. I think you will find amongst the real industrial population that there is no more feeling in London than there is elsewhere. These are only speculations of my own to account for it.

One appreciates that, Dr. Brackenbury; it is helpful to us to have these speculations.—So that I think among the doctors in London you have a large proportion who are not familiar with the work and who therefore give expressions of opinion about it which are not well founded, and also you have a proportion of insured persons who do not think much of it because they are soon going to be out of it and therefore do not take the same interest in its working as other people do.

It may be that you have also much larger numbers of persons who are so attached to their own household, domestic servants and

others, that they find it possible to get service apart from the Act?—Yes. When I was speaking of that class of insured person like insurance clerks and bank clerks who would soon be out of it I did mention those who were on the margin, meaning by that those not so much interested in what they themselves were going to get from the Act. Some domestic servants are in that position.

Professor Gray: Could you tell us whether, apart from the bank clerk type, the proportion of insured persons in London who do not choose a doctor is greater than elsewhere?—I do not know.

Chairman: Have you any figures on that?—I have no reason to suppose that is so among the industrial classes.

Professor Gray: That is the kind of person who causes trouble?—Yes.

If there were more of that kind in London who from indifference or otherwise do not choose a doctor, it might be a contributory cause?—That, I think, is another way of putting what I said, because out of the total number of insured persons in London there will be a far larger proportion of that type altogether than there will be anywhere else. There may be a few places in the country where it is true. I do not know. Dr. Cox: I think the influence of the press in creating this impression should not be overlooked. In my position I come across it a great deal. There is an active section of the press in London which eagerly seizes on any possible item against the Insurance Act for political purposes. They come to me carefully trying to work up all sorts of things which are not worth talking about, and I say so; things which in the provinces I do not think the papers would ever bother about. I could mention instances which have impressed themselves upon my mind which show that there always has been in the London press a section which would do almost anything to damage the Insurance Act.

Chairman: Is there nothing that the medical profession itself can do to give a more correct appreciation?—Dr. Bolam: It is extraordinarily difficult because such a press will not publish the other side. Dr. Cox: I could give you some very interesting examples of that. On one occasion—I will not particularize further than to say I spent a good deal of time just on the eve of publication in a London newspaper office arguing with the editor as to whether he ought or ought not to publish a reply of mine to a very damaging attack on the doctors working the Insurance Act, and he did eventually publish part of my letter after taking out the parts I fancied most. He told me quite deliberately: "You must remember we are not out to help defend the Act; we are out to try to kill it." That is an absolute fact, which I can vouch for. I am not going to give the name of the paper or the editor, in public, but I will give it privately if desired.

Miss Tuckwell: I thought all political parties favoured insurance. I do not understand what party there could be. Is it anything more than the objectionable press habit of always nosing out anything they can make saleable?—No, I think it is a deliberate political bias on the part of a certain section of the press which up to now—it is decreasing—has been glad to get hold of anything which would damnify the Insurance Act.

Chairman: This incident to which you refer, did it take place some long time ago or so years ago. I forget what was on at the crisis in the business and some violent and I was attempting, as I always do, to answer them.

Under your own name?—Yes, under my own name. Dr. Bolam: We do not, in saying this, suggest that any one political party is in any way interested in damaging the repute of the Health Insurance Scheme; it just is that there are certain organs of the press who, for their own purposes, engineer stunts of this kind, some in one camp and some in another, and they will not hear the other side, or at any rate they will not give expression to the views of the other side in the same full exhaustive fashion as they will give expression to views that are antagonistic.

Sir Arthur Worley: Dr. Brackenbury, you mentioned as one of the cases of discontent these border-line cases, birds of passage that pass out of insurance, and you instanced in particular bank clerks and insurance clerks. You really have no ground for that beyond a thought in your mind, have you, because both these associations have their own Approved Society, and we have had evidence from them, and from what we could gather they were keen and enthusiastic about the Act?—Dr. Brackenbury: I can only say their members are not, those who come to one. I live in a place in which my practice is largely not industrial; my insured persons are almost entirely domestic servants and young persons in fairly well-to-do middle-class families, and therefore I see a fair proportion of this type, and, speaking generally, they are people who would be glad not to have anything to do with the insurance scheme.

They resent it in that way, but they do not make complaints about treatment by the doctors under the panel system?—I did not say that. We are talking about the atmosphere which prevails in London that does not prevail elsewhere, and I suggest that if there is a larger proportion of people who have that general attitude towards the Act in London than there is elsewhere, that may be at least a contributory cause towards the atmosphere which does exist.

I should like to pierce that atmosphere and get at something more definite, because the impression left on my mind was that it was not just a passing feeling, but that in London the medical service was not as good as it was in other parts of the country: that the attention that medical practitioners gave was not as good. bluntly, that is the impression that is formed on my mind by the statements that have been made; not merely that a lot of people do not like the Insurance Act, but that they do not like the service they get. That is going past your atmosphere?—Yes, and as a general statement I do not believe there is any real foundation for that. Going beyond the general statement, I think, to be perfectly honest, one must say that in the poorer parts of London

there is a tendency sometimes, by no means always, and only in a minority of cases, to get a doctor who is himself a bird of passage there; he is very often not an Englishman, and he goes there in some cases only for a period of years.

**Chairman:** He is not a Scotsman either?—No. If you will not pursue the matter further, I will safely say he is not a Scotsman, but there are in these places a number of non-European doctors, perfectly properly qualified—and I am not bringing a general indictment against them. You will find also in London (I do not think you will find it to anything like the same extent anywhere else) in the poorer parts a class of doctor who is there for a while to see what he can make out of it for a certain number of years, and he looks forward, not unnaturally I think, to the time when he can move elsewhere and live in surroundings in which there are greater amenities. You will find a number of persons in London of that type in the medical profession that perhaps you will not find elsewhere, and in cases like that, in poor parts, where the tendency is to have a fairly large number of insured persons on one's list owing to the scarcity of doctors there, you will understand that one such doctor may give rise to dissatisfaction in 1,000 or 2,000 insured persons, and therefore that is the one possible little item of fact on which you might say that sometimes the service in London may tend to be a little less good than the service generally. But even that I do not want to put too high, but it is a thing which all of us have to recognize, whether we like to speak about it or not.

**Sir Arthur Forley:** Is it not a fact that perhaps the greatest trouble arises with domestic servants: that they have a greater objection to going to a panel doctor than any other class?—No, I should say emphatically not, and my experience is very largely amongst them.

I am glad to get that because it has been put to us that it was.—Emphatically not; some of their mistresses have.

that all the people in those towns got averaged 1.33 per year in one year and 1.30 in the next year, whereas now the insured person gets not less than 3.75 attendances, and we think they are higher than that. So that the effect of the Insurance Act has been to do what its author thought it would do, to get people to go and get advice from the doctor much more readily than they were able to do beforehand.

Would you say, speaking broadly, that they often come unnecessarily to the doctor?—**Dr. Brackenbury:** No, Sir. There is a certain percentage of people who do, but one also finds that there is a certain percentage of insured persons who stop away because they have not got to pay. We are gradually breaking that down. Speaking of the insured population generally, I do not think they come so unnecessarily at all.

Is it this feeling of strain on the profession to which you refer that makes you later suggest a narrowing of the class of persons entitled to medical benefit?—Not primarily.

If not primarily, is it substantially?—No. It is desirable to lessen the strain, but our main reasons for putting forward the suggestion that certain people should be taken out of the Act are based upon our first principles absolutely; that we think only those persons ought to be provided for in a scheme like this who are unable to make the provision for themselves.

Have you any indications to show that, in response to the increase of work and the remuneration offered, the number of practitioners in the country has substantially increased since 1912?—I think Dr. Cox has figures which show that it has not increased. **Dr. Cox:** I will hand in this Table. The figures are taken from the Medical Directory figures. You will see that in proportion to the population of the country—I have not the figures for 1924 yet—the number of doctors per head of population has not substantially increased; in fact in 1923 it was down slightly from 1922 [The table is printed below.]

Numerical Summary of the Medical Profession.

Year.	London.	Provinces.	Wales.	Scotland.	Ireland.	Abroad.	Services.	Total.	Increase or Decrease.	Total, minus "Abroad" and "Services."	Population.	Population per Doctor.
1911	6,415	17,721	1,336	3,958	2,724	5,188	3,300	40,642	—	32,154	45,221,615	1,406
1916	6,821	18,216	1,433	4,173	3,060	6,593	3,274	42,570	— 2	33,703	—	—
1917	6,903	18,185	1,445	4,334	3,193	6,613	3,203	42,879	+ 309	34,061	—	—
1918	6,903	18,090	1,447	4,482	3,322	6,646	3,141	43,031	+ 152	34,271	—	—
1919	6,933	17,971	1,450	4,578	3,379	6,627	3,162	43,100	+ 69	34,311	46,155,777	1,344
1920	7,085	18,087	1,446	4,544	3,356	6,465	3,276	44,250	+1,169	34,519	45,873,371	1,357
1921	7,130	18,173	1,428	4,573	3,421	6,847	3,354	44,926	+ 656	34,725	47,283,195	1,351
1922	7,131	18,194	1,448	4,599	3,483	7,256	3,475	45,516	+ 650	34,815	47,526,212	1,362
1923	7,239	18,657	1,511	5,137	3,623	7,406	3,458	46,311	+ 725	35,447	47,765,511	1,377
1925	7,490	19,381	1,591	5,685	3,954	7,932	3,452	47,628	+1,297	36,578	—	—
							3,318	49,351	+1,743	38,101	—	—

**Chairman:** On the broad ground, in any event, your view is, I take it, that there is not in the medical profession any greater proportion of black sheep than might be found in any other profession or any other walk of life?—Certainly not.

And that you are as a profession just as anxious, as I gather from your evidence, that any case of glaring breach of the regulations on the part of a medical practitioner may be visited with appropriate punishment?—Yes. I have sometimes said if you leave those to the profession they would probably have a worse time of it than if they were left to other people.

In paragraph 7 you refer to the heavy strain upon the powers and resources of the profession at times. You consider this partly due to the influence of disease and partly due to the influence of this system. In this connection I should like to know whether you think that the patient tends to go to his doctor much more than he would otherwise?—May I just say in regard to that, that you have put two things together. The heavy strain upon the resources of the profession is, of course, due to the unequal incidence of disease, the seasonal and epidemic. The influence of the body of regulations I will not call it strain, but mental effect. But that is of a different character and influence altogether from the other. The words "with the capitation method of payment" have no relevance. It is an insurance system quite apart from whether payment is by capitation or by attendance.

You mean as far as the regulations are concerned?—No, it is the fact that an insured person can go to the doctor without having to face a bill, whatever may be the method of payment, which would influence the number of times he would go, the readiness with which he would go.

Would that necessarily be so?—Yes, absolutely, and one is happy to say that under the insurance system an insured person does go to the doctor decidedly more readily than if that person had to face a bill.

One would want that to be the result?—Yes, it is the result.

All that the question is intended to direct notice to is that under the system of insurance, whether by capitation or direct fee, you have a freedom of approach to the doctor on the part of the insured person which you do not have if there is no such system?—Quite.

And therefore from the same number of people a heavier strain may arise for the medical profession than would arise if they were not insured?—It does in fact arise.

That is what the question was directed to bring out.—**Dr. Cox:** May I put in a figure which I think may be helpful. You have heard of the Plender Report.

Yes.—The Plender Report elicited the fact that in five towns in the United Kingdom in 1910 and 1911 the number of attendances

Have you any figures to show the total number of general practitioners in active practice and the proportion engaged in insurance practice?—Yes. These figures are very difficult indeed to get out and must be partly in the nature of an estimate. We have a very elaborate card register in connexion with our work in which we use all the information that can be got from many sources, but as regards some of these classes that I am going to mention they must be got out by a process of elimination. Our figures relate to April 18th, 1925, and show that we had 14,700

work in England, Scotland, and Wales. We have like whole-time Public Health Officers, Services, retired practitioners, those who describe themselves as consultants or teachers, and medical men who practise as dentists; and by taking out these classes we arrive at a figure something like 11,600 doctors who are in general practice, but are not doing insurance work. I think some deductions must be made from that. It is very difficult often to say whether a man ought to be put in the consultant class or not, but by this process of elimination we finally arrive at 11,600. Among these you have all the men holding junior hospital appointments, acting as locumtenents, assistants in practice who are not doing insurance work, and I should say it would be a fair estimate to say there are about 10,000 general practitioners who are not doing insurance work.

As against 14,700 who are?—As against 14,700 who are. Is it not the case that there are at present a substantial number of young doctors, especially women, who are unable to find sufficient work?—**Dr. Brackenbury:** Yes.

Does not that indicate, on your own criterion in paragraph 8 (c), that the attractions of the profession are substantial?—It indicates that they were supposed to be substantial six years ago, and it is now found that they are not. **Dr. Bolam:** A great deal more has been made of this than necessary because there always is delay in the absorption of graduates. In the last two years there has been an extraordinary number of graduates following on the rush into the profession in the years when there was a good deal of money about and people were encouraged to enter upon the profession, and in the next two years we shall be faced with the other fact, that there are very few graduates coming forward to be absorbed. There always is delay before these graduates get into circulation in practice. So I do not think too much should be made of that.

Is it your feeling that there is a lag now in students coming forward?—It is not a feeling, it is a fact. Look at the figures of registration as medical students in the last two or three years and you will find that in three years' time, instead of graduating 3,000, we shall be graduating something much nearer 1,300. **Dr. Cox:** Will you look at the table handed in? That shows that in 1916 there were two people less in the Directory;

has matured in the past with regard to that. We believe the possible multiplicity of regulations, the interpretation of regulations, and the application of regulations, are tending to go in this direction, but speaking broadly, as far as our experience during the past ten years goes, there is nothing inherent in the present system which destroys the principle of "free choice of doctor."

You lay great stress on the principle of "free choice of doctor." In addition to what you have already said in your general argument I should be glad to hear anything more precise as an argument on this aspect.—I do not know that one can say anything more precise. It is fundamental in the proposition I have already put before you, I think. The individual relationship must be preserved or the same good results will not follow. That is our belief.

What do you mean by individual relationship?—The relationship between an individual doctor and an individual patient. *Dr. Bolton*: It is wise for you to be able to choose your own doctor. You value that; it is good.

One values it whether it is wise or not?—It is good also for the doctor to know that he is the subject of choice. It has a distinct stimulating effect upon him. It induces a healthy competitive feeling. I do not think there is anything so satisfactory as the association between doctor and patient who have confidence in each other. It is the basis of medical work.

What happens in the single-practice areas where there is no choice?—*Dr. Brackenbury*: That, I think, we can quite easily see is subject really to similar influences. No doubt the single-practice area always presents some features which it is difficult to adjust to a general scheme, and in many single-practice areas which is a wide one there will be a few people at the centre who will perforce have to have a doctor whom they would not choose if they had choice; but you have to remember that in every single-practice area there is a margin all round in which there is competition and the effect of the personality of the doctor in that case does contribute to the success, or to the relative success or non-success, of the single-practice area man. Beyond that, I think you may say that unless the doctor, as we find in the case in a few areas, has some private means of his own which enables him to go down and stop in a place like that and live there regardless of whether his patients love him or whether they do not, he fails, he has to go out, he has to go elsewhere, and he is replaced by somebody who is personally more acceptable to the great majority of the patients even in that single-doctor area.

There is in that case a collective choice?—So that indirectly you have the same sort of effect, though there are always individual instances in practice like that where it is not effective.

It is the same principle, I take it, from your point of view?—*Dr. Coz*: I should like to say a word on that. In reading the evidence one has seen suggestions that this idea of free choice of doctor is a sort of fetish and that it really does not matter.

I have never yet myself met any individual who would not object very strongly to being told that he could not have his own choice of doctor. It is a matter of human nature. But I do want to point out that there are some people who are so foolish as to want to choose their own tailor or their own Member of Parliament, or other things which are much less important. But I do want to point out that you are dealing with a fundamental of human nature. I have never seen it put better than it was put before the Departmental Committee which sat in 1913 on Certification, to deal with the supposed excessive certification of sickness benefit. There was a witness there from Oldham, a woman doctor as a matter of fact, and she was dealing with the question of free choice of doctor, and one member of the committee said: "Do not you think this free choice of doctor is very much overrated?" and she said, "Well, we may be very curious people in Oldham, but not long ago the Co-operative Society resolved that in order to save money it would abolish its system of allowing the men who took orders for coal to go about the town just as they liked, picking up orders as they could, and have men who would be restricted to districts, and all orders inside a district must be given to the man in that district; and within a few weeks there was a revolt among the members, they wanted to have their own coalman call," and she said, "I think you will find the people in Oldham are at least as particular about the doctor who goes into the bedroom as they are about the coalman who calls at the door." It may be silly, but it is absolutely fundamental.

We have heard evidence to satisfy ourselves that they do make a fetish of free choice in Oldham.—*Dr. Brackenbury*: That is a point I wanted to emphasize, that it is not merely a question of applying a certain amount of learning to a particular patient; it is a question of knowing and appreciating the whole personality and circumstances of the person, and the less learned man may be the better doctor after all sometimes.

*Sir Arthur Worsley*: You mean the patient would get better sooner with him?—Yes.

*Chairman*: In this connexion will you tell us in a little detail your objections to a system of clinics, dealing with the advantages of specialization and the like, as well as with what you consider the objections?—I think our use of the word "clinics" is sometimes ambiguous; we are not always talking of the same thing. When we talk about a system of clinics we are thinking not merely of the premises, but we are thinking of the system of establishing premises staffed by a limited number of persons and limited to a certain extent of practice. There are certain things which to a cannot do in practice. If we are talking about that system, our objection is fundamentally the same that we have just been talking about during the last few minutes. We have no objection to the premises as such in cases where it seems desirable to provide them, provided the other circumstances can remain the same; that is to say, that every doctor can have access to them for his own

patients and that any patient is not obliged to be attended by a particular doctor. And, of course, there are a large number of diseases which have to be attended domiciliarily and not at a clinic, and in the present system of clinics domiciliary treatment is completely discredited from attendance at the clinic. So that if you are speaking about the convenience of having premises which a practitioner can use, I have no doubt that in certain rural areas and in certain densely populated industrial areas it might be much more convenient to have a common consulting room and surgery at the same premises rather than have the poor rooms which doctors in those poor areas manage to obtain. So if it is merely a question of premises, other things being left on the private basis, if one may put it so, one does not mind. We appreciate that there may be circumstances in which they are advantageous.

What you fear and find it necessary to enter a caveat against is that they might be the beginning of an inevitable movement towards a whole-time State medical service?—That is not the whole and end-all of our objection, but we do say that a system of clinics set up by public authorities and staffed by whole-time officers would be the easiest and most objectionable form of arriving at a State medical service. *Dr. Bolton*: It diminishes freedom of choice. It is the same fear that you have been describing that leads you to oppose it?—Yes.

We gather you would oppose strongly any tendency towards a State medical service, believing, as you do, that it would be a bad thing?—A whole-time State medical service, *Dr. Brackenbury*: There, again, it is a question not exactly of good or bad, but of relative merits.

It would be relatively bad, is that your opinion?—Yes. You can describe one as relatively bad and the other as relatively good, but not necessarily as a thoroughly bad thing.

We note the two remaining principles (d) and (e). In connexion with the latter, would you take into account as a relevant consideration that under the capitation system the practitioner gets an assured quarterly cheque and has no trouble over bills or bad debts as the private practitioner has? Would this in your opinion, justify a somewhat lower nominal scale than for the private practitioner?—We have said in our Statement that that is one of the features—security—which has to be taken into consideration and which does tend to lower the capitation fee as against other things, but we point out at the same time that there are other features, which have to be taken into consideration which, in our opinion, more than counterbalance this, which is, after all, relatively a small feature. The Plender Report brought out the fact that, taking everything of this kind into account, it so it is relatively a small matter. We agree that it should be taken into consideration, and by itself would tend in this direction, but there are other counterbalancing things which also have to be taken into consideration.

*Miss Tuckwell*: I was very interested in your statement about the domestic servants' side, on which the Chairman put some questions. You have had a large experience of domestic servants?—Yes, I think I may say I have.

And you find that the insurance system is as popular with them as it is with other classes of the community?—There you are inviting me to make comparisons. I think there are other classes of the community with which the scheme is more popular than with domestic servants, but it certainly is not unpopular with them.

We have had it put to us a good deal in evidence that domestic servants do not avail themselves of the National Health Scheme, and that they do not go to insurance practitioners as regularly as other people do, but that is not your experience?—Not the least. My experience is quite the contrary. There are still a certain number of mistresses who ask their servants to go to non-insurance practitioners.

*Chairman*: Do they pay for them?—Yes; the mistresses pay. *Miss Tuckwell*: Why?—I suppose it is a survival of the 1913 prejudice. The other motive is that they have in their house for themselves a doctor who does not happen to be an insurance practitioner, and they are quite willing to pay the bill of their servant.

Of course, one has a tremendous admiration for the medical profession, and I am only asking these questions for the medical mind. What experience I have had makes me feel that domestic servants do not make so much use of this scheme as one would wish. With regard to servants I have come across, I have found that I have had on several occasions to employ my own doctor. I found that when I sent them to the panel doctor they found the time and were kept there unduly. Is that a complaint of which you are aware?—Do you mean that this waiting time is made longer in the case of domestic servants than in the case of other people; that they are segregated and made to wait until other people have been attended to?

Yes.—I have not found that. You have never had any complaints?—Not the slightest. Domestic servants when they are on your list will come to you as readily as other people will. Certainly in all the practices with which I am personally acquainted there is no difference made with regard to waiting or methods in the case of domestic servants. Not with regard to domestic servants only, but that was my experience with insured persons and private patients. They were kept waiting a very much longer time?—Oh, no. Another thing which I have found has been that instead of going to the principal doctor they have been sent to an assistant who was not so well qualified as the principal to deal with their difficulties.—I cannot answer as to the connexion between principals and assistants, because I have never had an assistant. But

insured persons have the right, of course, to demand the attention of the principal if they wish to do so.

They have the right, but in many cases you can imagine that young women would not claim it. Do you not think that one of the causes of complaint about which the Chairman spoke—founded or unfounded—is that the principal man turns over the insurance cases to an assistant to deal with?—No, I do not think so. My whole experience is against that, at all events in recent years.

I do not know whether any other gentleman can help me over this. Have you any experience, as an Association, of complaints of insured persons being turned over to an assistant?—No, we have not. Of course I have been a member of an Insurance Committee also since 1913, and although there were a few individual complaints of that sort in the earlier years—quite at the beginning—they have entirely ceased for years now. *Dr. Dain*: The number of practices in which an assistant is employed is a comparatively small one, and there is no opportunity for the principal to turn a patient over to the assistant. But in the practices with which I am familiar where assistants are employed, the head of the firm and the assistant work equally together. They take consulting hours at the same time and the patient probably goes into the same waiting-room and can choose which doctor she will. It is possible that she may have three doctors all working simultaneously and she goes to see which she likes. She may have the choice of three doctors, being on the panel, although only one of the doctors in such a case might be her panel practitioner.

That is not the case in the instance of which I am speaking. I ask the question because one wants to find out what is at the bottom of the discontent which is brought to one's attention on many occasions.—*Dr. Cox*: As one who has been an assistant, may I say that this is an old complaint of patients which is quite independent of the Insurance Act. Whenever a man had an assistant and the patient unfortunately did not see the principal and had to put up with the assistant, the patient had a complaint; but in a big practice where an assistant is necessary that sort of thing must happen sometimes. I certainly have no evidence that there is any general practice amongst doctors to employ assistants and to use those assistants mainly for insurance work, in that way making a class distinction.

So that you do not think that any discontent that there is could be justified by that, because you will admit that although no doubt it was different in your case when you were an assistant, usually the principal is the more skilled man and one does turn to him?—*Dr. Brackenbury*: I do not know that you can generalize about that. I am thinking of one very large insurance practice in which the great majority of the insured persons implore to see the assistant.

I think that amongst working women there is appreciation of the service which they receive from the medical profession under the Insurance Act, and a great desire to see an extension of the benefits; but I do hear of cases in which the surgery accommodation, for instance, while generally improving, is very inadequate in many places. Do you get complaints of that?—We have occasional complaints. I am speaking now as a member of an Insurance Committee. Those complaints go to an Insurance Committee; but we have always found that if the Insurance Committee goes to the Panel Committee and they then go to the doctor to remedy this complaint, they are met in the friendliest spirit, and the deficiency is remedied at once. That was particularly the case in a systematic inquiry of this kind which was made in London. A certain number of doctors were visited, and it was found that there was deficiency in the surgery accommodation in certain instances, and in every case they had only to call attention to the deficiency and to state what they thought would be the right thing for the doctor to do, for him at once to acquiesce and do it.

But you have had a certain number of complaints as to the insufficiency of surgery accommodation and of waiting-rooms?—They have been very few and not very important. They really came largely during the tremendous influenza epidemic of 1918 when there were people who had to wait even outside in order to see the doctor, because there was no room in the waiting-room. You cannot make in private houses or in surgeries, or even in institutions, complete provision which would always cover the biggest emergency, and I think a good many instances of this kind, in so far as you can speak about a good many where the total numbers are quite few, did originate about that time.

Do you feel that the complaints as to insufficiency of surgery accommodation and waiting in draughty passages and the general weakness of accommodation in some cases, which I know to be improving from what I hear from my own working-women friends, might very largely account for the feeling there is with regard to the complaints to which the Chairman was alluding?—Not very largely. *Dr. Cox*: May I say that if it did it is very unreasonable? It is not generally taken into consideration that the Insurance Act has brought a large influx of people into surgeries and waiting-rooms which were quite adequate before, and I know many doctors who tell me that they have had to make structural alterations at great difficulty and expense. Sometimes they live in places where, for structural reasons, they cannot do it, and they cannot move, so that some of these complaints, of course, are quite legitimate. But you have to be very gentle in the way you deal with them, because sometimes it is almost a physical impossibility to improve the accommodation. *Dr. Bolam*: And the same difficulty is very often felt by private patients. It is not a differentiation with regard to insurance patients.

I should also like to ask about the broad principles which you set out in paragraph 8 as fundamental, and your statement in paragraph 6 as to the immense value of the insurance medical service. As you show how great has been the value of that service and

how much it can do for the community, what is your motive in suggesting that anybody should not be brought within the scope of National Health Insurance? What is the principle which has actuated you? You are restricting it rather than increasing it. You are giving a wider service but you are proposing to restrict it to a poorer class?—We propose to give it to a much larger class.

When dealing with dependants, you only suggest that the dependants of the very poor should be included, and you govern all you say by saying that attention should be paid to whether or no people can pay for the service. What is your motive for that? If it is a good thing why do you care so much whether they pay for it themselves or not, directly or indirectly?—*Dr. Brackenbury*: That is a matter of social opinion, if you like to put it in that way. We believe that it is a good thing for people to help themselves when they can do so, and that it is by no means the function of the State to do everything for everybody.

So that really you feel that full medical attention is essential for everybody, and you tell us that it is desirable. You only guard yourselves to the extent you do by considerations of how good it is for people to pay for themselves—entirely another motive?—Our proposals would, I think, almost, if not quite, double the number of persons who would have the benefit of an insurance scheme, and we believe that it is right for that number to be included, because without some such scheme they would be unable to get for themselves the medical attention which they ought to have.

But my point is that in extending in some directions and rather drawing in in others you are actuated, not by considerations of the health of the community, but by what you believe to be the effect on character?—No. We believe that the health of the community would be equally good with the exclusion of certain people who are already included, because those persons could obtain attention for themselves. We also think that there are a lot of people outside now who cannot obtain it for themselves.

You say they can obtain it for themselves. Do you mean that people with incomes under £250 a year—manual labourers—could obtain it for themselves?—Certainly.

So that really in suggesting these alterations you are basing it on your own opinions of what they can pay for and what they cannot?—Yes, but the health of the nation would be served equally under our proposal—more, we think—than under the other.

That is your opinion?—*Dr. Bolam*: It is not merely opinion, but also experience.

*Sir Arthur Huxley*: They could either pay for it or they could not. If they could pay for it they would have the advantage, and if they could not pay for it they would come under this scheme?—*Dr. Dain*: That is it, surely.

*Mr. Evans*: In (c) in paragraph 6 you say that, speaking generally, the work of practitioners has been given a bias towards prevention which was formerly not so marked. Could you tell us in what way that bias is apparent?—*Dr. Brackenbury*: I have already answered that in a specific question; but I do not know whether it would help if I gave you an instance which was given before the Insurance Acts Committee some time ago by a certain practitioner who was a member. He said that he had found it to pay him, in comparison with some of his neighbours, in one of the earlier influenza epidemics, to seek out his insured persons and give them preventive inoculations, and that his work during that influenza epidemic—the actual number of attendances and visits that he had to give during that epidemic—was distinctly less than that of his neighbours who had not taken the precaution, or had not used that means of seeking out their insured persons and offering them preventive inoculation. That is a specific instance in which, if you look at it even from the narrow point of view of avoiding trouble and getting your money with less work, you will see that by using preventive measures you make an economic profit, if you can look at it on those lines. That is one practical concrete instance of the application of the general attitude which we are sure the circumstances of the Act are engendering in medical minds—namely, that prevention is, after all, the best thing if it can only be achieved. *Dr. Dain*: In my area, too, opportunities are now being organized for practitioners to speak to their own patients on the subject of how to keep well. A series of lectures is being given and each man lectures to his own patients. The professional difficulty was got over in that way. Only his own patients are invited by card to attend a lecture at a certain time. I know one doctor who has had to repeat a lecture twice in a hall which would hold from 200 to 300 persons. People like it, and he has had that opportunity of doing some very exceptional preventive work.

I think that is rather an exception. It is not a feature?—It is a feature of the Insurance Committee part of the scheme.

I have heard of lectures being delivered by the Medical Officer of Health.—These are delivered by the insurance practitioner to his own patients.

That is proof that there is a distinct bias given to the preventive side of medicine?—Yes.

I do not know if I quite understand what you mean by (f)—that clinical records have been, or are being, provided which may be made of great service in relation to medical research and public health. What records do you refer to particularly? You refer to other records later on which you say are rather irksome.—*Dr. Brackenbury*: We are referring to the same record card in both instances; but we do not mean more than we have said. If you will read that sentence you will see that it is a carefully guarded sentence.—“That clinical records have been or are being provided which may be made of great service in relation to medical research and public health.” It was a well considered sentence which was approved by my colleagues, after it had been put to them, because it was in the form in which it appears.

We are by no means claiming that great use has been made of those records or that they have been of great service in relation to medical research and to public health. They have in some instances been of appreciable service. If those records were confined to clinical records, and were made rather better as other things which are not in our opinion essential, they might very easily be made of proper use. Even if you collated only those cards of people who had died or ceased to be insured persons, which must accumulate somewhere, it would be useful, even without going into the doctor's waiting-rooms and making extracts from them, as the Regional Medical Officer and other doctors in a particular town to take a particular disease and to make full clinical records of that particular disease and to make proper use of using them. Apart from that, which is a very valuable way of using them. Apart from that, which is a use of use, I think it would be of great value to public health. *Dr. Dain* I think in this connexion the members of the Commission before long will have the opportunity of reading the Report of the Chief Medical Officer to the Ministry of Health, from which they will find that statistics are now being prepared. Statistics are being prepared as to the existence of certain diseases, which will be made use of by Sir George Newman in his Report, I believe.

Do the practitioners themselves enter up the particulars on these cards?—*Dr. Brackenbury*: It depends what you mean by "enter up." We rather protest against the necessity of entering up every visit and consultation and having to get out the card in order to do that.

Say a man was suffering from a particular disease, does the practitioner enter on that man's card that he is really suffering from that disease?—Absolutely. There is no reason why he should not, and every reason why he should.

*Sir Humphry Rolleston*: Is it not difficult at this time to express an opinion on the value of these record cards, because it is only since early in 1921 that they have been instituted?—That is so; but we have a feeling in the profession that they have not been made as much use of as we could have hoped they might have been. That may be reasonable or unreasonable; I agree that the time has been short. We do, however, like to feel—and I am sure I am speaking for insurance practitioners generally—in this—that if we do keep careful clinical records of our patients, they should not only be of use to ourselves when we refer to that patient's card again, or to our successor when he has the card handed over to him, but that some public health use might be made of them, so far as they can be made use of, and we are not quite satisfied that that has always been done.

*Mr. Evans*: Another question on paragraph 8, where you tell us, I think, that you consider that a separate health scheme might be instituted; that is, that the provision of health services might be lifted out of the insurance scheme altogether. You say, however, that you object to a National Medical Scheme. I do not quite understand. Is that objection of the profession to a National Medical Scheme somewhat in the nature of the objection that we referred just now to the prejudice of the profession to the National Health Scheme in 1911 and 1912—in the first years. Is not this a somewhat similar prejudice now?—No, it is entirely different, if I follow what you are referring to. The feeling of the profession against a whole-time salaried State health service is based on entirely different grounds from the prejudice that there may have been at one time.

Is it political more than medical?—It is medical. *Dr. Dain*: It is not political. *Dr. Brackenbury*: Our experience leads us to believe that the medical success in dealing with patients and with public health would be greatly inferior under such a system from what it is under a system which is based on the methods of private practice.

Why do you say that? It is only speculative, I take it?—I do not know whether this question is coming up later on our evidence. It appears to do so.

*Chairman*: We will not allow repetition. You may either follow it out now or later, whichever you prefer.—The fundamental objection is, of course, what I have put—namely, the preservation in full of the confidential and intimate relationship between the individual doctor and the individual patient.

*Mr. Evans*: How would that be possible if you had a National Medical Service?—I am entitled to ask in reply to that what is exactly the National Medical Service Scheme which you have in mind, because in the National Medical Service Scheme, as we envisage it, and as has been generally put to us, there are three or four directions in which it would destroy, or largely minimize, that confidential relationship. In the ordinary way there would be no free choice of doctor, or, at all events, there would be an extremely limited choice of doctor.

You have a limit to-day.—You mean to say that all doctors are not on the insurance panel.

No, I do not mean that; but in a certain geographical area there have a certain number of doctors in a certain radius, and the choice is limited.—Quite so. *Dr. Cox*: We do not limit it.

I do not see why, if we had a national medical scheme instituted, a man might not still have a choice of doctor from the panel.—*Dr. Brackenbury*: If you can elaborate a National Health Service Scheme which will give as great freedom of choice to the individual patient as exists under the present circumstances, of course, that objection falls to the ground; but we have not seen any approach to that in any national scheme.

That is the chief objection?—That is the chief objection, that in that way, and perhaps in other ways, it would destroy individual relationship. We are assuming that under such a system the doctor

would be paid by a salary. That is the usual scheme, and the payment of a doctor by a salary will tend to diminish the confidential individual relationship between that doctor and the persons who choose to go to him. *Dr. Cox*: May I give you an instance which struck me very forcibly at the time? A young fellow who was in the army—I knew him before he went—was very keen on a State Medical Service. He and I had often argued this question. "What do you think of your State Medical Service now?" He said: "What do you mean?" I said: "You have been having a State Medical Service for the last two years in the army." He said: "It is all right as long as you are a hospital case. You could not have better treatment than you get in the army then; but I am bound to say that if you are not feeling very well—not quite up to the mark—and you want a little friendly sympathy and help and encouragement, you soon find that the doctor you go to is not your doctor at all. He is acting for somebody else; he is the State doctor." That, to my mind, puts the finger on the exact spot. The doctor paid by the State for a block of people would be the State doctor, and not the man's doctor, and when I am ill I want the doctor to be my doctor.

Is the analogy quite a good one, do you think?—I think your salaried whole-time medical service would have to be almost an exact analogy. You would have to have an area to which a doctor would be allocated.

That would be a detail of the scheme?—It is not a detail; it is essential.

The big thing that you, as doctors, are concerned with is the health of the nation?—*Dr. Brackenbury*: And of the individual. If the individual is healthy I suppose the nation would be fairly healthy too. That follows, does it not?—Yes.

Because you are concerned with the health of the people, that should be your first consideration?—Yes.

And if, by instituting a national medical service, the health of the nation is going to improve?—That is exactly what we dispute. *Dr. Cox*: That is begging the question.

You dispute that?—Yes; we not only dispute that, but we maintain the opposite.

It is really speculation. We do not know what will happen. But when the National Insurance Scheme was instituted you had a very strong body among the profession which was hostile to the scheme. That, you say, was due to prejudice, and to-day that is dying down, and you call it indifference. May it not be possible that the opposition of the medical profession to a National Medical Service will also die down?—I drew a distinction between antagonism and indifference, not between prejudice and indifference.

But the term "prejudice" was also used.—Not in that connexion. I have no doubt that there was a certain amount of prejudice at that time in the minds of certain doctors against any scheme.

Because it favoured of a State service?—Quite so.

If that State service becomes still more deeply established, I suppose there will be a bigger opinion now of the medical profession against it?—There, again, we cannot pursue the argument unless we know what you mean by a State service. A State service in the lines of the National Insurance Act, preserving, as it does in the main, the features of private practice between the population and the doctors, having as unlimited an interchange amongst them as the general population has, with the element of competition between doctor and doctor, so that one doctor can do well under it and another doctor in the same sphere of practice do not so well—if you can preserve all those features in a national health service, by all means preserve them, and let us know what the Health Insurance Scheme, *Dr. Bolam*: May I say, as one who is not an insurance doctor, that the feeling in the profession is that the prime relationship should be between the doctor and the individual, and not between the doctor and a Government department, or any lay body? That is the essence of the whole matter. We regard that as the essential thing, to preserve the incentive to the practitioner and to stimulate the best work in the profession. In the case of a purely whole-time State-salaried medical service there is not the incentive to deserve the confidence of the individual. The effort in the case of Government control is directed rather in other channels. It is directed to satisfy some committee or body, and not to satisfy the individual.

But you do not suggest that the chief incentive to the doctor is really a question of salary?—I hope not. The incentive to the doctor is to do his work well, and, incidentally, to receive an adequate remuneration.

But your suggestion is that it should be to the benefit of the medical profession?—Not at all.

*Mr. Jones*: I doubt whether you can draw that conclusion. I offer me any explanation as to the probable causes of the increasing cost of sickness last year and this year that has been reported to us. It is a matter of very great importance to us. As you know, considerable surpluses have accrued in the insurance funds, and the question may arise as to the disposal of the surpluses. We are told by various witnesses that there is a very definite increase in the cost of sickness and in the cost of drugs. Can you afford any explanation of those two increasing costs?—*Dr. Brackenbury*: Why that should occur in a particular year, we cannot say. One of the troubles of our medical work is that it is not uniformly spread over the year or over a series of years. We have our own evidence that the number of items of work which we have had to give per insured person during this last year has undoubtedly been materially higher. That may be partly due to the insured person gradually being more and more willing to seek our services, or it may be due, of course, to an increased amount of illness necessitating those services. Why an increase of sickness of that kind should come about in a particular year or at a particular

time we, as practitioners represented here, are unable to say. No doubt, broadly, afterwards, the statisticians, taking all these circumstances into account, might be able to throw some possible light on the subject; but we, doing the work week by week, are unable to say why it should come along in that way.

Is this increase, noticeable last year, and apparently very much greater this year, due to one of the causes you have mentioned—namely, the increased use made by the insured person of the insurance medical facilities, or is it due to a probably temporary wave of sickness?—I think we should receive help in answering that question if we knew whether not only the attendances and visits of practitioners had gone up, but whether sickness claims had gone up, because there is no relationship necessarily between the number of visits that a doctor gives and incapacitating illness. It is quite possible that an increased number of attendances may be accompanied by a fall in incapacitating illness. I do not know whether sickness claims have gone up as well as professional work. If they have, then that suggests that there is increased sickness. *Dr. Dain:* We know that we have busy years and slack years. We have healthy years and unhealthy years. The interesting feature of last year, to my mind, is the fact that we had such an extraordinary number of attendances and such a good death rate. I would have expected that the amount of extra work we did was out of all proportion to the amount of sickness pay required by the insured persons. Last year was a most extraordinary year in that respect.

We have had put to us by an official witness some prescription statistics from Lancashire. There was a greater demand for prescriptions from Lancashire, and he was rather inclined, I think, to attribute that to some peculiar circumstance in Lancashire—that the people like the bottle more than the doctors?—*Dr. Brackenbury:* The greater demand for services is also very marked in London. I think it is universal.

I happen to have with me the last return of the Glasgow Insurance Committee. In the quarter ending December 31st, 1923, there were almost 431,000 persons on the panel lists, and in the quarter ending December 31st, 1924, there were 445,000 odd. That is equivalent to an increase of 3.3 per cent. Prescriptions prepared in the first period were 166,000 and in the last period 194,737. You say you would like to know whether there has been an increased claim for sickness benefit. We have evidence that during the earlier months, at any rate, the claims of one fairly representative society have increased by 25 per cent.—It seems to me that that must indicate either an increased willingness on the part of the doctor to prescribe rest, or an actual increase in sickness. I could not say which it is. *Dr. Dain:* It is common knowledge that the epidemic of influenza this year, while not very fatal, was more widespread than any since 1919. *Dr. Brackenbury:* If you are referring to the first three months of this year, that would account for it.

As between the two influences, would you say that a greater increase of sickness is accountable for these increased figures rather than an increased resort to the medical profession?—I do not think one has the material for answering that. I think both things are operative.

Is not that one of the directions where, if we made a very free use of your medical records, we should be able to determine some of these things?—I suppose you could; but I should have thought that it would be very interesting, and probably helpful, to get the respective curves of the doctors' attendances, and of estimating in the best way you can the sickness claims, to find whether they ran in the same direction, or whether they varied very much.

*Chairman:* On the sickness claims, might there not be some want of proper comparison by reason of persons who are being prescribed for claiming on the unemployment fund, rather than on the sickness fund?—*Dr. Dain:* That is not very easy. The exchanges all require that they shall produce certificates that they are fit to work.

Not certificates that all applicants for unemployment benefit are fit for work?—Yes—medical certificates that they are fit for work before they will pay them unemployment pay.

How often do they have to produce a medical certificate?—Whenever the clerk in charge of the exchange thinks they could not work if they were offered it.

That is if they have been sick; but there is nothing in the machinery of the Labour Exchanges that requires a claimant for unemployment benefit to produce a medical certificate?—They make them do so constantly.

In a doubtful case, probably that would be so?—The doubtful case is estimated by the appearance of the person in the eyes of the clerk in charge. They are constantly asking for certificates that the persons are fit for work before they will pay them unemployment pay.

Have you found that recently?—Yes, constantly; every week.

*Mr. Jones:* Important witnesses have stated here in regard to London and in regard to the Midlands—particularly those two areas—that panel practitioners in general make an undue use of the facilities available at public dispensaries. Put briefly, a patient comes to a doctor and if he is going to be the least troublesome he is referred at once to the infirmary dispensary or the voluntary dispensary. That has been repeated to us quite a number of times by witnesses to whose opinions I think we must attach some importance.—*Dr. Brackenbury:* I do not believe there is any foundation of truth in it at all. I think you will find statistics vary, and I do not know how far statistics are going to help us. But the statistics of the out-patients' department of hospitals, which are concerned very largely in this matter, vary, I understand, very considerably. We have had presented to us the statistics of the London Hospital, which one would suppose to be fairly representative or helpful in this matter. Since the Insurance Act came into force in London the attendance at the out-patients' department there has dropped very materially indeed. That for what it is worth. I think that the opinion that has been expressed

in that direction arises from several misunderstandings. In the first place, there is a considerable amount of illness amongst insured persons which is a hospital illness of a kind which is completely outside the contract of the medical practitioner. There is a whole class of medical practice which is not provided for at present under the regulations of the Insurance Act, and that goes to hospitals. Then there is another class of case which in poor areas (which are the ones referred to largely) has the important result that even in cases which are legitimately the sphere of the practitioner—shall we take rheumatic fever or pneumonia?—the conditions of the house in which the patient is made it much more in the patient's interest that the case should be dealt with in other surroundings; that although it is acknowledged and accepted to be the insurance practitioner's duty to see that patient through the pneumonia or through the rheumatic fever, he feels that if the accommodation is available in better surroundings it is in the interest of that person to transfer him to those better surroundings. It is not alone with a view to avoiding work which he has contracted to do, but it is done in every case in the interests of the patient himself. When you have eliminated those two classes of cases, I think the number of instances in which an insurance practitioner deliberately avoids work which he has contracted to do by putting it on to an institution is negligible. *Dr. Bolam:* May I say from the hospital point of view that the class of work that could possibly come under the question would be out-patient work in the main. There is a general policy now on the part of the larger hospitals that all work which is properly the work of an insurance or general practitioner should not be continuously sent to a hospital. Although it is difficult to refuse to any person the right to get, as it were, another and perhaps a higher opinion, the hospitals now, in the main, take the policy that they will not accept work which is general practitioner work. That is fairly usual throughout the kingdom. *Dr. Brackenbury:* On behalf of the insurance practitioner, for several years we have been appealing to hospitals to take that course in order that there may be no possible excuse for practitioners to make use of them in the wrong way. We have asked that they would send back to the insurance practitioner cases that ought to be in his province, and can be equally well treated by him at home as in the hospital, and very largely they do it. Some hospitals have done it for some time and others are doing it now, but we have asked the hospitals to do that now.

*Professor Gray:* There is one paragraph in your Statement which appears to me to be excessively modest. Perhaps you ought to have an opportunity of clearing it up. You refer to a number of directions in which you think money might be better expended than in providing a general health service. That is in paragraph 2. How much importance do you attach to what is said there?—In this connexion we do not attach very great importance to it; but we do want it to be clearly understood as being the professional opinion that the expenditure of public money might be used to greater advantage in regard to national health, speaking generally and freely, than by merely the establishment of a National Health Scheme; that these other measures to which we refer are great measures which, if the public money could be expended on them, would result in vast improvements in the public health.

Seven out of these are not precisely medical; they range over pure milk and so on?—They all have their medical aspect.

Is this what you want to say: That medical attendance is really not much use without fresh air and healthy surroundings and good public houses, and all the rest of it?—That medical attendance is only a very useful adjunct to such things.

*Chairman:* These are useful adjuncts to medical attendance?—I thought I would put it in the most favourable way that I could to the questioner.

*Professor Gray:* If you have these favourable conditions, medical attendance becomes a comparatively minor matter?—The volume of medical attendance required would be immensely reduced.

You mention corresponding expenditure. Of course, corresponding expenditure would go on a long way in some of these things?—Yes. That, I understand, is the view of the profession as a whole?—Yes.

What troubles me a little is that apparently it was not until 1922 that the profession came to the conclusion that the measure of success achieved by the National Health Insurance Scheme was such as would justify them in carrying it on. Had not you before that some idea that the work was, in fact, of the utmost value?—*Dr. Bolam:* It was only categorically put then to the organization. *Dr. Brackenbury:* We got a definite resolution put down on the agenda, as it happened, in our Representative Meeting in 1922.

But you are not trying to tell the Commission, are you, that from 1912 up to 1922 the profession were going on with this work believing the extermination of vermin and the improvement of public houses and the supply of pure milk to be more important than what they were doing?—Certainly. If you had asked us at that time whether we thought these were collectively of more importance than the work we were doing, as far as its influence on the national health is concerned, we should have said: "Yes." You must remember we began the medical benefit in 1913, and in 1914 came the war.

Let me carry that a stage further. You remember what happened in the early days. Dr. Cox has referred to the Schuster Committee. You remember, I expect, how witness after witness on the medical side, including Dr. Cox himself, came along and told us that it was impossible to attach too much emphasis to the arrears of sickness. They came and told us dreadful tales of people who were suffering all kinds of terrible illnesses. Should not that experience of 1913 and 1914 have given them a higher faith in their own work than apparently they had?—I do not want you to assume that there is any lack of faith in our own work. It does not imply that at all. But we regard this other work as of immense importance, and we say that if you are

regarding the thing from the point of view of the nation and considering in what way, broadly, you can spend a large amount of public money to the best advantage to the public health in general, we do not wait you to assume from our not mentioning these things that we do not consider them of prime importance.

But you rather went further than that. You gave me to understand that as between 1913 and 1922, if the profession had been asked they would have said: "You will do far better not to pay us our money at all, but to divert it to killing rats and to these other objects."—It is purely hypothetical, but if that question had been put for serious consideration by the profession in 1913: "What are the best ways in which, given an immense sum of money, it could be spent to the advantage of national health?" we should probably have replied just what we do in this paragraph. *Dr. Dain*: We should not have begun by the treatment, the necessity for which we think ought to be avoided.

I should like you to explain a little more fully the significance of the first of your general principles: that medical provision should only be made for those who in fact would be unable to obtain it without the help of the Insurance Scheme. I think you explained to the Chairman that of course there were all manner of intermediate cases, but what interpretation would you place upon the words "unable to obtain it without the help of the Insurance Scheme"?—*Dr. Brackenbury*: Do you mean in applying it to different classes of persons?

Yes. As I understand you, in practice that means the acceptance of some sort of income limit in a normal case?—Yes.

Do you imply that income limit should be drawn at such a stage that in actual fact people below that income limit would be without medical treatment at all, apart from insurance?—Without anything like adequate medical treatment. You see the poorer-paid insured person at present does in some way or another get attention for his dependants sometimes.

So that the interpretation of this clause turns on the use of the word "adequacy" which is not there?—I should not say that quite. It might be adequate, but entirely charitable, which I imagine is not what the State wants.

I suggest to you that you do not in practice, as far as I understand your Statement, object to the £250 limit?—That is so. We have refrained from suggesting, and we have no wish to discuss here, any particular figure as being the income limit. As a profession, among those representatives who finally approved this statement there was definitely the feeling that for the purpose of this criterion the income limit of £250 was probably unnecessarily high; but we do not wish to discuss whether it should be £250 or any particular figure. On the whole, we were inclined to think from our experience that the income limit could be drawn at a lower level than £250 and yet this criterion be complied with.

But the person below £250, if he is in the upper regions of that limit, does in fact get treatment for his wife and dependants, does he not?—Yes. *Dr. Dain*: He pays for it.

If he pays for it he could also pay for treatment for himself?—*Dr. Brackenbury*: Yes.

And the same would apply until you come down absolutely to the bare subsistence wage?—*Dr. Dain*: Not as far as that. *Dr. Brackenbury*: If you define a subsistence wage as being sufficient to find medical treatment for one's family; but that would be begging the question.

I suggest to you that on any interpretation that can be put in paragraph 8 (a) unless you introduce, as you were inclined to do until you were prevented from doing so, the word "adequate," you will get an extraordinarily low limit. I suggest to you that the real test would be, not whether or not an insured person would be unable to receive, but whether he could not without an undue sacrifice obtain it, or could not obtain it in adequate measure provision "we are thinking about the scheme we outline."

Let me put another point in continuation of that. You lay down five essential principles. The first is that under the Act would be unable to obtain it or pay for it presumably?—*Dr. Dain*: Yes.

Then in the fifth recommendation you say the remuneration you should get for that should be the same as you get in comparable private practice. I suggest to you that putting these two together there is no comparable private practice?—*Dr. Brackenbury*: Should be such as you should get, not as you do get. We are assuming the State is not going to exploit us to the extent of our having bad debts against it. In an agricultural practice we assume there are people whom the doctor does in fact see without charging; but assuming they pay the medical fees of their class a certain income would be produced in that way, and that is what should be compared.

That is rather difficult to determine?—No, I think not. The word "should" here is very deliberate. I think you will find chosen.

The Chairman asked you a question about the extent to which under an Insurance Scheme people went to the doctor knowing that there was no trouble about it, and you suggested that there was no difference between a capitation basis and an attendance basis. There is to this question—namely, that under the attendance basis the insured person, having a heart, does not mind calling in his doctor, because he believes the doctor is getting fees every time he comes. Do you think there is anything in that?—No, I do not think there is. It is not a matter that occurred to one in that form before, but as you put it to me it is theoretically possible that that may be so, but I do not think that it would be. *Dr. Dain*: When you get to that state with the patient the respon-

sibility begins to be the doctor's as well as that of the patient, and the doctor should say, "I shall have to see you once a week or once a day or once an hour," or whatever he thinks necessary.

I merely put that point because it has been put to us. Whether it is a plausible suggestion or not I do not know. I think it is plausible, but there is no evidence of it.

*Sir Arthur Morley*: You have the instance of Manchester.—*Dr. Dain*: We have no evidence of such a point being raised in Manchester. On the medical side we have no evidence of that.

*Chairman*: Have you had any special representation from the Manchester Medical Section?—*Dr. Brackenbury*: We have no special memorandum from them, but we have had their representative specifically appointed for the purpose of formulating this evidence.

But they have not wished to canvass their arrangement in your body generally?—*Dr. Dain*: In years past they have put up their suggestions as to points that are worthy in that particular arrangement. But they have had their full representation in regard to this scheme, and there has been no protest from Manchester. *Dr. Brackenbury*: We did have not so very long ago in the Insurance Acts Committee a special memorandum prepared for us by the Manchester doctors represented on that Committee, with the help of the Insurance Committees of Manchester and Salford. They put in a long and elaborate memorandum for the consideration of the Insurance Acts Committee and of those who were associated with them, which received full consideration.

*Mrs. Harrison Hall*: On paragraph 8 I would like to ask if you would describe what you mean a little more fully under (b)?—I think we do that in Section B. In the first paragraph of Section B we state all the things which we think such a service should include. Paragraphs 19 and 20 set out specifically the various kinds of provision which we think of as a complete medical provision.

*Mr. Cook*: A moment ago you were asked some questions about the Manchester system. It would be interesting to know if you have anything to say as to the Manchester system—whether you would prefer its general adoption, or whether you would prefer the present system?—We can say very emphatically that we think the Manchester system has very serious disadvantages.

*Sir Arthur Morley*: To whom? To the insured person or to the doctors?—To the administration generally, I think.

Do you suggest that the Manchester system of units acts in any way detrimental to the insured person?—No; we have no evidence that it does.

Therefore, if there is something to be said against it, it is to be said against it from the point of view of the doctors themselves?—One position is that we think that methods of distribution like that should be left to local option. When we talk of a capitation system, what we are thinking about is a system by which the Central Pool shall be constituted by an actuarial estimate of the number of insured persons, multiplied by a certain figure. That constitutes the Pool. The method of distribution within an area could very well be left to local option, as it is now. We think that nobody else but Manchester and Salford will probably adopt their particular method.

Manchester and Salford, as far as it has been put by the Insurance Committees, think that their system of working by units is a distinct advantage to the insured person and keeps well to the front and really accentuates that point of individuality between the doctor and the patient which has been referred to, and there is the feeling that the patient is better served. That has been put forward.—We do not agree with that view at all. We think that it is disadvantageous to throw all the bias away from prevention on to multiplying attendances.

*Chairman*: There are supposed to be checks?—Yes; the doctors have had to elaborate them. There is a series of checks which make the actual remuneration received by the doctor approximate very closely to what it would be on a capitation basis.

We were told in evidence that these checks had been so scientifically applied as to nullify any tendency there would be to over-attendance?—Quite so.

*Sir Arthur Morley*: But you think the sentimental and moral effect of being paid by attendance in that way would rather tend to take the medical man away from the preventive side, for which he would not be paid?—Undoubtedly. *Dr. Dain*: There was a great advantage in the Manchester system prior to last year, in that it gives free choice to the patient of doctor, which we had not at that time elsewhere.

*Sir Arthur Morley*: I think *Dr. Brackenbury* has cleared up the point in my mind that the tendency of that system is, not to go in the direction of prevention, but rather in the direction of the particular case.

*Professor Gray*: With regard to these checks, I understand the position is that there is a committee of doctors which looks through the attendances, and, if need be, cuts down the attendances from a certain number to a lower number?—*Dr. Brackenbury*: Yes.

Can you tell me how far it is possible for a committee coming in afterwards to know whether or not a doctor has put in too many attendances? Must not they decide very largely by what the doctor himself says, especially after the thing is all over?—Yes.

The alternative to the capitation system, as we envisage it, would be a complete bill of the character which would net in every case, which has obvious disadvantages. *Dr. Dain*: In the Manchester system, after the checks have been applied, it works out as a case-value payment, because by the time the checks have been applied your cases are averaged at a value and you have not been paid in effect on attendances but on case value.

What always troubles me is how they can know where to cut down the attendances after it is all over.—*Dr. Brackenbury*: They cannot know. It has to be done in a mechanical way.

They do not look at the attendances; they look at the number of the patients.—*Dr. Dain*: And the total attendances. *Dr. Dain*:

The Manchester man is put to an enormous amount of administrative work in connexion with this. They think now, with the experience they have had, that their system does work with comparatively complete justice, but it has had to be arrived at not only by averaging, but by interviewing doctors, and a good deal of trouble has been gone to which doctors in a capitation area are insured person the right of going to any doctor at any time, but this is now secured everywhere.

**Sir Arthur Worley:** It has also been urged that it gives the insured person the feeling that each time the doctor came to see him he was being paid for it, rather than the feeling that he did not know whether the doctor was being paid or not.—If the patient had that impression it would not in fact be true. With all the checks, that is done away with.

**Chairman:** The checks, as I understand them, do not remove it from the category of an attendance payment.—**Dr. Dain:** They bring it to an average.

**Sir Arthur Worley:** I think it was put to us that the checks were to see that the doctor put down the ordinary number of attendances, and if he had put down what his colleagues thought were a greater number, the matter was adjusted.—Yes; it is discounted to the normal.

**Chairman:** Have you a representative from Manchester with you?—**Dr. Brackenbury:** No; but we can have one here next time. We have made arrangements by which we could get one. **Dr. Cox:** You must remember that the Manchester doctors, at any rate, have long since arrived at the conclusion that the whole system simply gives into their hands the same amount as they would get under the capitation system, no more and no less.

**Sir Arthur Worley:** I am not looking at it from the point of view of whether the doctors get more or less individually; I am looking at it purely from the insured persons' point of view. Do they think they get better treatment by that system?—**Dr. Brackenbury:** If the insured person realized what the insurance system was he could not think so because it would not be the fact. If he is deceived by something which has no reality it is a very difficult thing to give evidence on it.

It is only carrying into effect earlier as to the feeling between a doctor and his patient being one of confidence. There is a good deal in that, and I am quite sure that the Manchester people think that.—We have not found the opposite tendency in patients to come to us under a system by which we are paid by capitation fees. **Dr. Dain:** the total attendances given to an insured person are not any greater under the Manchester system.

**Chairman:** I now come to Part II, Section A. In this section you deal in detail with the persons to be provided for. From paragraphs 11 and 12 I gather that you desire to exclude a substantial number of people who at present are entitled to medical benefit and to bring in others who have hitherto been outside the scheme. The reductions are in the main those above a certain income, whether engaged in manual labour or not; and the additions, those persons below that income who are not employed under contract of service, the dependants of all those insured on the reduced basis, and the destitute who at present receive medical attention under the Poor Law. Is this a fair summary of your proposals under this head?—**Dr. Brackenbury:** Yes, with the proviso that "the dependants of all those insured on the reduced basis" depend upon what the reduced basis is.

In what way does it depend upon them?—If the basis, for instance, were left as it is now, we should not be in favour of all the dependants and all those persons being brought in. But if it was on the present basis it would not be in favour of the basis?—**Dr. Dain:** It might as compared with what we visualize as the whole scheme.

I do not follow that.—We both leave out and take in. As I understand that.—We both leave out and take in.

considerably reduced basis, and that if the basis should be a reduced basis, and that if the basis were considerably reduced the dependants might then be brought in; is that right?—**Dr. Brackenbury:** We have not gone quite as far as that. We are not concerned definitely to dispute the propriety of the £250 basis, if on other grounds that was the figure ultimately fixed. We are excluded. Suppose the £250 were the basis we think ought to be excluded. We think that the basis for the inclusion of all income should be lower than that.

**Miss Tuckwell:** Did not Mr. Evans elucidate that the view of the Association was that there should be a personal touch between the medical man and the patient? If that man is properly and adequately paid they did not care whether the payment were made by way of National Health Insurance or by a private person. Was not that so?—No, not as far as I follow it. All we say is that if a person can by payment out of his private purse secure these things, we do not think that he ought to be included in a National Health Insurance scheme.

**Chairman:** But I have some difficulty in following just precisely what the proposal is. As I understand it, you say so far as the medical services are concerned, let the basis be an income basis?—Yes; an economic basis, at any rate.

You suggest the best economic basis is an income basis?—It must involve that consideration.

Whereas the basis at the moment is a combination of income and another test—a manual test. You say let it be an income basis. Then you say further that within that income basis not all who might fall into insurance should have their dependants provided for as well?—That depends what that income basis is. If you draw that income basis low enough, then we should agree that everybody below that line should have their dependants included. If you have that basis drawn at a higher level, we might say that for the inclusion of dependants you must have a lower basis.

I think we follow that. That clears up the difficulty of what the proposition is.—It is a little difficult to talk about in the absence of concrete figures, which we do not want to go into. I think you can help us by indicating what in your view would be a proper figure at which dependants might be brought in as well as the insured person himself?—If we had to say off-hand what might probably prove to be a general opinion in the profession it might possibly be £2 10s. a week—£130 a year. I do not wish to insist on that particular figure.

But that is what you have in your mind?—Yes.

**Miss Tuckwell:** Is that £2 10s. for a man who has a family to support?—**Chairman:** The proposal is that if the income basis on which you are bringing people into insurance is higher than £130 per annum, you should only bring into the scheme the dependants of those who have less than £130 per annum?—Yes, assuming that £130 is the agreed figure.

That is merely a figure suggested off-hand?—Quite.

With a certain amount of consideration, no doubt, but not tying yourselves at all?—That is so. **Dr. Dain:** Not in the least. The two essential things are that there should be a personal choice on the part of the patient and that the medical man should be adequately paid? Why should they bother about the finance of the thing at all if those two points are met? If you have those two stipulations, does it matter?—**Dr. Brackenbury:** I do not quite follow.

**Chairman:** Miss Tuckwell asks why it is that you should suggest that only the dependants of those with an income limit of £130 should be brought in. She rather gathered from your earlier evidence that the two desiderata were, first, care for the national health and, second, fair and proper remuneration for the doctor. The personal touch always being preserved. If you had these desiderata met, as you would have, irrespective of whether the payment was made out of the patient's private purse or out of your State scheme, Miss Tuckwell does not see why you should draw any distinction?—People may differ as to where the line should be drawn, but there does come a point at which the line which enables him to make provision for his family.

But that rather begs the question, does it not? The underlying presumption is that all who are contributing to the scheme are, in point of fact, out of their own pockets—with the aid of the employers' part and the State part—making provision for their medical attendance?—Certainly. The point is at what stage should they be compelled to make this provision for their dependants? Why should you be bothering about it?—Because we are not concerned with our own emoluments primarily.

But you have a right to be concerned about them.—We are concerned about them, but I said "primarily." **Dr. Dain:** Miss Tuckwell is wishing to know why it is we are not content to receive the money from the State as well as from the private individual.

**Miss Tuckwell:** Why do you bother about the source of the money?—May I say on that that we are not wishing to extend beyond what is absolutely necessary for the needs of the State? State doctoring of that kind. I say that quite explicitly. We have accepted the National Health Insurance Scheme with its limitation of our traditions and ways of practice in order to meet an acknowledged want, and beyond what is really necessary we do not want to go. I think that answers Miss Tuckwell.

**Sir Arthur Worley:** What I take it you have in your mind is that when you consider a man gets sufficient money that normally would enable him to pay his own doctor for his dependants, you do not wish to encourage him to lean on the State. He should be a self-supporting person, and you do not wish to deprive the dependants of action on their part?—That is so.

**Chairman:** Even though he chooses to lean on the State you do not think that you should be asked to sacrifice in any measure what you regard as the traditions of your profession?—That is so.

**Sir Arthur Worley:** I think Miss Tuckwell's point is that you are giving evidence from the point of view of the medical profession; that you agree that you do not bother with their money, but you say that as citizens?—As medical citizens.

**Chairman:** But you are not suggesting that you are merely giving evidence from a medical point of view. You are merely a professional point of view with regard to emoluments and everything else?—**Dr. Brackenbury:** We want to contribute whatever our experience has led us to acquire towards a properly strengthened Health Insurance Scheme.

At the same time you are entitled to advance your own views as to what your emoluments should be, or the basis on which you should be concerned?—**Dr. Cox:** I think the average doctor would say that the ideal form of medical practice is where the doctor can go to the doctor of his choice with his own money in his pocket, and pay for it, the transaction being just between the two. That is the ideal thing. That is the thing that the duke and the wealthy man do, and if it is good enough for them it ought to be good enough for other people. But we know there are people who cannot do it, and you have to provide for them. We do not want, however, to provide for any more of them under a system where the State comes in than we can possibly help. **Dr. Brackenbury:** If we could state our ideal it would be that every man should be paid a sufficient income to enable him to pay his private doctor.

**Sir Arthur Worley:** I want to get it clear what your idea is as to what insured persons would be within the scope of the Act. If a particular man, while he came within the scope of the Act, in fact only got £150 or some lower figure, then that man would be entitled to free medical attendance for his dependants; but the man between £150 and £250 would have to pay for his dependants, as he does now?—Yes.

So to speak, it is a measure of partial dependency, which may be quite an important matter?—With this proviso, that if the line is drawn low enough it becomes total instead of partial.

Instead of being 15 additional millions it might be providing for 7 millions; I do not know, but it is an important aspect and I wanted to get that clear.

**Professor Gray:** Is that point of view general in the profession? I have heard doctors say that the profession was the best in the world and that there was only one kind of dark aspect in it, which was the fact that they sent in bills. If they could be relieved from sending in bills there would be no shadow in the firmament?—**Dr. Bohn:** That could be obviated by people paying cash. **Dr. Cur:** It is the repeated sending in of bills that worries the average doctor; sending in bills to people who cannot pay.

But is there a shadow even the first time?—Yes.

Does not the doctor escape that shadow on the horizon under a system by which the insured person is not responsible at all?—It is not good to make things too easy for people.

**Chairman:** I suppose from what you have said that there can be no doubt that the "ins" would substantially exceed the "outs," so that the volume of contract practice would be markedly increased?—**Dr. Brackenbury:** Yes.

As to paragraph 15 (a), in this you propose to widen the excepted classes so as to put, for example, banking and insurance clerks outside the scheme. You realize that the definition of the excepted classes is a matter of considerable difficulty and adds to the administrative complications of the scheme?—We realize that the definition is a matter of considerable difficulty. I am not quite sure that it would add to the administrative complications of the scheme, because the scheme is unnecessarily complicated by the existence of these people in it now.

Administration is always more difficult when an arbitrary line is drawn?—I imagine the existence of these excepted classes does create difficulty in the working of the machinery at the present time. I do not think there can be any doubt about that. We anticipate that the administrative way of carrying out this suggestion would be by the Minister of Health giving to particular employers a certificate that their employees were excepted. It would have to work in some such way. There would be no difficulty, for instance, I suppose, if we took the five big banks and said their employees were outside.

I agree that it helps enormously if you are taking them in the bulk and not individually.—We never supposed in this class of person that you would take them individually.

Did you suppose in the other class on the income limit for dependants that they would be taken individually?—Yes.

That would add enormously to the difficulty?—Yes. Would it be practicable at all?—Yes. We get income limits now. We come to that question in a difficulty we admit later on of applying an income limit to a manual worker.

There is no income limit applied to the manual worker?—That is so.

Surely it is in the case of the manual worker that there would be the greatest difficulty in applying an income limit?—Yes.

So that it would add to the administrative difficulties?—It is not that this particular proposal as to dependants would add to the difficulty; the difficulty is applying an income limit to a manual worker at all.

But under your suggestion that would have to be done?—Yes. The income limit as regards dependants would be no more difficult than applying an income limit to a manual worker.

I am not so much concerned whether it is under your major proposition or your minor one that difficulties would arise; but difficulties would arise?—Yes.

In your view, however, it would be worth surmounting the difficulties if it could be done?—Yes. With regard to these exempt classes of persons, they would, I imagine, administratively be exempt by certificate of the Minister given to their employers saying that the employees have such security of employment, and so on, as to put them outside.

**Sir Arthur Warley:** Would you put them outside altogether?—**Dr. Dain:** Yes.

And they would be very glad to go?—**Dr. Brackenbury:** Yes; they are of a class which rather resents being inside now.

**Chairman:** Under paragraph 15 (b) you wish to exclude from medical benefit classes which correspond to what we call the exempt class. We have had it in evidence that this class really appreciates the medical benefit to which for eleven years it has been entitled. Does this not weigh with you at all?—If we were assured that it was a fact, of course it would weigh with us; but what we have in evidence is, is it not, that out of 33,000 of such persons 30,000 have in fact applied for medical cards; that is to say, that, having these rights and being entitled to take this benefit, a very large proportion of them have in fact taken it, though it does not follow that every one of those who have applied for a medical card is in those who come to us is that, in fact, they do not appreciate it very much. They are the class who say to us habitually in our consulting rooms: "We do not care about this scheme. We would just as soon that it was not here, but as I am entitled to come to it, and not pay, I will do so." The fact that, being entitled to it, a large proportion of them have claimed the medical card, does not prove that they would be aggrieved as a class if their title was taken away; in fact, our experience, gathered from those who come to us, is that they would not mind.

**Sir Arthur Warley:** In other words, they have got something for nothing, and they take it?—Yes; and they are not particularly anxious to have it.

**Chairman:** Would you go further and say you do not think they should have it?—They would be quite content not to have it.

In paragraph 15 (c) you make a very drastic proposal. At

present large numbers of manual workers above the £250 limit receive medical benefit. Would it not cause great discontent to deprive them of the privilege which they have enjoyed and appreciated for twelve years?—There, of course, we come upon the difficulty of applying an income limit to manual workers; but it would not necessarily be our proposal that those who have paid for a certain number of years should be individually excluded. The arrangement might easily be made that those who came under a newly enacted limit and who had already paid in should be individually allowed to go on. We make no proposal to cut off all those people who happen to be in the scheme. We, of course, agree that if a person has paid under certain conditions for a certain number of years it would be inequitable to deprive him of the benefits he has paid for.

Have you any estimate of the number who would lose benefit under your various proposals?—No, we have not.

You realize, do you not, that there is a real difference between the manual worker so far as security, etc., are concerned, even though his income is above £250, and the salaried clerk, for example, above the limit?—Yes, there is; but, on the whole, I think we can say that the manual worker with the more substantial income is, generally speaking, in a more secure position than the manual worker of the more lowly-paid type. He is generally a foreman or some workman who by reason of his good work and loyalty has secured a position which is more certain than the more lowly-paid; so that the more you go up, the larger will be the proportion of manual workers with an income of over £250 a year, about whom you could be more certain of their position.

Do you think that the exclusion of the persons suggested would result in their obtaining less satisfactory medical attendance than at present?—No.

Do you not think that it might be wiser to add gradually to the scope of the Act as conditions allow rather than to take the benefits from many people so as to make way for entirely new people?—No. We think that the urgency of attention is much more for the dependants of lowly-paid insured persons than for some of present highly-paid clerks and workers.

**Sir Arthur Warley:** You mean the highly-paid clerk?—The manual worker comes in. We propose to exclude in certain cases insurance and bank clerks as a class, because during the greater part of their life they are above the income limit.

**Chairman:** On your proposal for the inclusion of persons not under contract of service, do you not see great administrative difficulties in enforcing the payment of contributions for medical benefit?—Yes, there are those great administrative difficulties. I have no doubt that if the politicians said it ought to be done the Civil Service would find ways of doing it. In so far as making suggestions is concerned, there are some of us who can make them, though it is not a medical job.

Are there any suggestions which you would care to name to-day?—No, except perhaps that it might be necessary in these cases to take an annual instead of a weekly premium. The great difficulty is in securing the raising of stamps week by week in these cases; but there are means by which you could secure an annual payment of the year's premiums which would entitle him to go on. There would be much less difficulty about that than there would be about securing a weekly payment of a few pence.

It would need to be retrospective?—Yes.

What about the destitute at present under the Poor Law? How do you suggest that the payment for the provision of medical benefit for that class should be financed?—The Poor Law guardians or, as we hope, the local administrative authority which may succeed the Poor Law guardians, would be in the position of the employer in that case. The whole of the premium would come from the Poor Law. The people who corresponded to them in the age

There again up sum payment annually?—It might be so or it might not.

All these suggestions involve, do they not, very considerable administrative problems?—Yes.

Have you worked the scheme out in detail at all?—No. We have realized the difficulties, and we have certain suggestions which we could make, which we should put up for consideration for what they might be worth—some might be found impracticable—to get over those administrative difficulties.

Anything you have said now does not seem to me to answer the detailed difficulties that would arise. I do not know whether you have worked your suggestions out roughly. We have not worked them out in any way in which we can say we have got rid of these difficulties. We realize that those difficulties are mainly the applying of an income limit to a manual worker, and the securing of contributions from those who are under no contract of service. In those few cases the difficulties are very great, and all we can do is to make some suggestions for consideration by those who know more about those problems than we do.

Broadly speaking then, your proposals under Section A are that after you have excluded certain people, and added others the resulting mass of population should receive an extended medical benefit under a contributory insurance system?—Yes.

You do not feel, do you, that there would be any real detriment to the character of professional work and to the prestige and dignity of the profession resulting from the very substantial increase in contract practice which you propose?—No.

Is there in fact any real professional demarcation between insurance and non-insurance general practitioners?—None at all. **Professor Gray:** I must confess that I have had a good deal of difficulty in understanding your proposal with regard to dependants, and I think that difficulty has been general. Would it be right to say that that possibly reflects a certain difficulty in drafting this Statement because of the desirability of getting a common measure of agreement amongst those who were parties to it?

carely that. This is not a compromise as far as it goes. There are those who wanted to go further, and there were those who did not want to go so far; but this is not a complicated compromise. In order to meet that, those who said, "Under no circumstances do we want dependants to come into an insurance scheme at all," had to be abandoned; and those who said, "We want all dependants of all the existing insured persons to be brought in"—and there were a number of both classes—had also to be abandoned.

But there is a difference of opinion in the profession, and, if I may say so, that difference of opinion is reflected here in your statement in certain phrases, some of which suggest one solution and some another?—I do not think so. Can you draw attention to the phrases that you have in mind?

In one place you seem to suggest the inclusion of dependants and further on you talk about it being hypothetical. Reading this over, I suggest, a lack of definiteness as to what the proposer means. I want to make it quite clear that we are not in favour of the inclusion of all the dependants of all the present insured persons. We believe that would aggravate the defects of the present system by including a great many people who need not be in. On the other hand, there are some members of the profession who said, "No, we do not like this thing and we do not want anybody else in at all, however great his need. His need must be provided for in some other way," without telling us what he other way was.

With regard to your various limitations, if I might suggest it, here are, I think, considerable administrative difficulties in the way of giving effect to what you suggest. For instance, take the first case. You use the word "except," but I think you mean "except." You suggest the exception of certain classes of people—bank and insurance clerks. Have you considered the fact that there are similar people in similar circumstances elsewhere and in other societies who are to all intents and purposes in the same position?—That is why we put "e.g."

Chairman: Which paragraph is that?—15 (a).

Professor Gray: Now are you going to define "e.g." when it comes to an Act of Parliament?—Our suggestion is by the Minister of Health being given legislative powers to exempt in particular cases where he is satisfied that these conditions hold. We do not say that every insurance clerk or every bank clerk should be excepted; we do not say that nobody who is not an insurance clerk or a bank clerk should be excepted. We think that probably the administrative machinery—though it is not our job—must necessarily be by certificate from the Ministry.

You would certify certain professions?—Certain employments or the staffs of certain employers.

You would take, for instance, a certain insurance company or a certain bank or the Stock Exchange, and except that particular employment on the ground that normally these people are to a certain extent people who are of middle-class origin and will probably go out of insurance by the time they are 25?—Yes.

But you realize, do you not, that you have exactly the same kind of people in other occupations who also in all probability will go out of insurance by the time they are 25 or so?—If they were in bulk in any particular place, they also could be certified. I agree that wherever you attempt to draw a line in a miscellaneous population you will have some persons on the wrong side of it.

Although the bulk of bank clerks and insurance clerks go out of Health Insurance comparatively early, there are amongst them people who are in origin of the exact class who require Health Insurance and who, for one reason or another, never get beyond the income limit; is not that so?—Yes. You have had in evidence that there are such persons; but they are not common.

But they are there?—Yes. They would be on the wrong side of the line, unfortunately.

This scheme of putting out a considerable number of classes would not operate without a considerable number of people falling on the wrong side of the line?—There might be a considerable number, but the proportion, I think, would be very small.

Then take the case of people who have a certain unearned income. That class covers a particular kind of person at the present moment. There is the person who in fact applies for exemption and gets it, and there is the person who could apply but does not in fact do so. I understand your suggestion to be that the whole lot of those, not merely those who apply for exemption and get it, but those who do not apply, should be cut off from medical benefit?—Yes.

How are you going to get down to the second class?—That is the difficulty. How you are to get the information where a person does not himself want to disclose that he has this private income is, of course, a difficulty, and it might be that you could not get at it at all.

You have the case of a person with a private income of £28, we will say, who is a normal insured person otherwise. That person wants to remain insured. There is no compulsion on him to apply for exemption, and he wants to remain insured. What steps can the Government take which would be effective, which would bring that type of person to the surface?—I am unable to say, and the difficulty might be such that we should have in practice to confine this to the person who would disclose the facts and say: "I do not want to be insured." These are consistent with our first principle, we think; but there are these difficulties.

I suggest that you could not get these people to the surface and comb them out without a very offensive inquisition into their means?—If the Commission or the Treasury authorities came to that conclusion, then the only thing to do would be to say that if those people wish to be excluded they shall be excluded altogether from the insurance scheme.

Taking the case of the manual worker who has over £250 a year, I think your suggestion is that the highly-paid manual worker is in a fairly steady position in life, and you could trust to his always being at a high wage. What are your grounds for saying that?—What we say is that if there are manual labourers who are above the income limit, who earn, shall we say for the moment, more than £250 a year, they really, from the national point of view, stand in no more need of assistance than the clerk who earns £250 a year.

I suggest to you that very often the reason why these people get high salaries is, in fact, because their employment is very irregular. The normal type of case which comes along is the man who has to do very heavy work, let us say, unloading boats. While they are employed they may get quite a big salary, but that work only lasts while there is a boat there. The following week they may have a very low salary or none at all.—You will observe that we do not say "paid at the rate of £250 a year," we say "an income of £250 a year."

Does not that produce a great complication? It is possible to know the rate, but what the actual sum per year is is a very difficult matter to determine; in fact, it could only be determined retrospectively.—That is so.

That brings in a new idea which cuts clean across the existing machinery?—I do not see that. It assumes that there may be other ways of collecting contributions towards a National Health Insurance Scheme than by putting stamps on a card every week.

Take the kind of thing I have instanced—the case where a man may oscillate between £4 and £8 per week. That is quite a common type of case, is it not?—Yes.

At the end of the year you have to determine whether or not that person has been generally within the scope of insurance. Do you think that is a proposition that could be faced?—Yes. Dr. Dain: He has to make an income tax return. Dr. Brackenbury: I think in the course of the second year you could get from that man, as you do in the case of income tax, a return of what his income had been during the previous year.

Chairman: There are quarterly returns for income tax purposes?—Yes; and if at a given period of time—six or twelve months, or whatever it might be—that man has, in fact, received that income, he would not be an insured person.

Professor Gray: And on the strength of the past you would suspend him from medical benefit, although in the future he might persistently be below the limit?—He would come in again.

But you take a year, and on that year you determine whether he is an insured person, determining the matter after the year is up?—Yes, you would give him his year's grace.

I am putting the case of a man who is paid a salary which puts him above the limit in that year. At the end of that year, for one reason or another, he falls down to a lower level steadily. How are you going to operate that in respect of that period when he was above?—I do not quite follow.

He has had one year at a small salary when he was getting medical benefit. On the strength of that he rises on a year. Then there comes a year when he goes up. On the strength of that middle year he ought to go out of medical benefit; but you cannot do that till the end of that year. At the end of that year he goes back to his low normal level again.—That man, according to the scheme I have in my mind (which may be quite impracticable), would never go out.

Because in fact you are acting retrospectively?—That is right. You will find in the course of the second year that he is not getting an income above the limit, and he remains in. You have not taken him out for the one year in which he did get above it. There are great difficulties, and I do not suggest that any ideas I have in my mind from the administrative point of view get over those difficulties completely; but I do think that they are difficulties which should be faced and probably could be got over. If they could, they would result in a better National Health Insurance Scheme than we have now.

Chairman: You would agree that you could not very well have a scheme of "in and out"?—Not "in and out" in short periods of time.

Professor Gray: Medical benefit is in a sense a prospective affair, is it not?—Yes.

Your determination is retrospective?—Yes.

And that itself raises considerable trouble?—Is not that common to it now?

Chairman: You do not have the same variety of wage in non-manual employments that you have in manual employment?—No; the security and steadiness is greater, I agree. At the same time if you can do it, the manual labourer who is earning above a certain income has no more claim upon the State contribution than the clerk, who may not be earning so much.

If he is in regular receipt of it?—Quite. Dr. Bolam: There are manual workers who are not subject to rapid fluctuations and who are in receipt of steady incomes.

Professor Gray: With regard to your conditions, in the event of the scheme being extended to dependants, you want nurses added, and a few other things, and a reduction to a minimum of all records and reports and a lightening of those required in regard to existing insured persons. That, if I may say so, is a laudable generality with which we would all concur; but what does it come to in practice? We all desire to lighten burdens.—Dr. Brackenbury: In the first place we should desire to have at once what we ask for annually from the Ministry of Health and get refused—not being compelled to enter a tick on our card every time we see a patient. We think from our point of view that it is a wholly unnecessary labour. It involves, even on the most trivial occasions, your seeking out a particular card from a bundle, your turning it over and putting a tick in an appropriate place and putting it back again, without having to make any clinical record of the thing at all.

to send him. You make a private practice you in fact  
attendances?—Yes. You must keep a record of visits and  
that rather brings us to a point you mentioned this morning  
in which you suggested that perhaps some of these records are not  
so diligently kept as they might be, and I rather think you said  
that in a sense there would be more zeal than in keeping these  
records if you saw that they were being used for some useful  
purpose. Do you think if the medical profession saw that they  
were being used for some useful purpose in which they might  
have a share, these records would be better kept?—Yes, on the  
whole. We were talking about using them for national health and  
scientific purposes.

*Miss Tuckwell:* Arising out of paragraph 16, where  
the question of whether a contribution from the public  
be required for every one of his services, would it be  
any of the suggested experiments to put it to you, that the  
health of the country would be improved by the medical

Mr. Tuckwell: I am talking about using them for national health and purposes. The question of whether a contribution from the employer should be required for every one of his employees, regardless of all, or any of the suggested exemptions, is not a medical question, I want to put it to you that when you dealt with the question of the health of the nation you were dealing with a medical question. Extraordinarily interesting as your evidence is on other points, it has only the same interest as that of any other body who might come before us.—Yes, on this point. If it is held that an employer must stamp his card for every one of his employees, all we point out is that our proposals do not interfere with that being done. On such a point as this you give your evidence not as medical men but as citizens?—We give you our evidence as citizens with our experience gathered from the working of this Act and our practice generally. A doctor, as a citizen, is able to throw some light upon the aspects of public life from the working of this Act and our practice as it has done intimately in contact with all sorts and sundry people in connexion with health matters, more and more, even though it does not bear an eminent, bringing in indirect payment that it over an entire, many say what for.

Dr John Anderson: Following up what Professor Gray was putting to Dr. Brackenbury, you want, Dr. Brackenbury, I gather, to draw a line across the general body of munim workers and to say those above the line shall not get medical benefit, and those below the line shall. Is that so?—Yes, that is so. You recognize that there are great practical difficulties in every sort of variation in particular conditions, and those overtime, and with the conditions? Do you not think that such a

Yes; it is one of the great difficulties that has to be faced.  
Does it not seem to you to be a really formidable difficulty?  
*Dr. Holam:* But in many of these industries  
periodically. But in many of these industries  
But after the amount over a period of time  
possible to get

possible time after the event?—Quite. We have said that.  
Following that up, would you propose that the man should be  
in and out quarter by quarter?—*Dr. Brockenbury:* No; we should  
not propose that.  
Then what is the significance of the quarterly return?  
*Bolton:* Simply to combat the statement that the man should be  
get them. *Dr. Brockenbury:* There would be no new world!  
the longer margin which would be controllable year  
the free insurance than is conceivable now.  
difficulties could be overcome by new world!  
difficulties could be overcome by new world!

But I am not clear as to what the case really is.—  
before you he will have been in that position can afford to him: "Bar."

position really is.—The case here can afford to do this for him: "Because during the past year you have been in a position to pay for your own medical treatment, we are going to deprive you of medical treatment for the next year, when your financial position may be quite different"—Do not you think that when a man is in a prosperous condition he ought to be thrifty?

**Mr. Evans:** Would not this follow also, that during his year he would have paid in contributions?—Yes.

He would have to wait and see the result of his treatment for his next year.

**Sir Arthur:** Would not this depend on his earnings?

"So, that during his prosperous  
 contributions?—Yes, and he would get  
 his treatment for the previous year.  
 "I take it he would get his treatment, and  
 the question is whether he would be able to charge him as a  
 private person?—The idea I have in my mind, which is a private  
 one, is that he would be treated under the Compensation  
 Act, are you not?—I am not very familiar with them.  
 You are familiar with claims under the Workmen's Compensation  
 Act, are you not?—I think the general principle is that when a workman meets  
 with an accident inquiries are at once made and a form filled up  
 as to what his actual earnings week by week have been during  
 the last twelve months, which, of course, arrives at what his wages

**Insurance?**

 weekly earnings. To arrive at his weekly earnings you must  
 the employer. I suppose there are millions of claims each year by  
 We want to admit quite freely that we see these formidable dif-  
 culties, but we think if they can be overcome the result will be  
 nationally beneficial.  
 I am trying to help you. You must not think, however, that  
 because I put that suggestion to you I adopt your view.—Quite  
 so. As to suggestions to meet the difficulties, we are willing to  
 contribute what we can, but we do not claim to have any  
 special knowledge.  
 Chairman: You are like ordinary citizens now?—Quite  
 Taking now paragraphs 19 to 31, we  
 important matter contained in  
 gather that you desire in  
 the scheme  
 census

Chairman: You are like ordinary citizens now?—Yes.  
Taking now paragraphs 19 to 31, we come now to the very important matter contained in Section B of your Statement, I gather that you desire that the medical provision for all persons in the scheme should be, as far as possible, complete. This means, does it not, that you desire to add to the general practitioner treatment, consultant and specialist treatment, laboratory facilities for clinical purposes, residential institutional treatment, dental and ophthalmic treatment, nursing, ambulance services, and the like?—Yes.  
And that this widely extended service should be available to all insured persons entitled to medical services?  
dependants?—Yes.  
Then you would like to have the same service available to persons within the scheme who are not insured persons?  
services?

persons entitled to medical benefit, and their services—*for example*, the treatment for tuberculosis and venereal disease, infectious disease, hospitals, maternity and child Welfare Centres, the school medical service, and the Poor Law medical service. Would your aim be to co-ordinate and, if possible, bring under one local administration all this range of service? We should go a little further than that seems to indicate. It would not be mere co-ordination and bringing under one local administration, but it would mean the practical abolition of some of these services by their absorption in the National Health Insurance Scheme. We envisage, for instance, the Poor Law medical service and nearly, if not all, treatment centres—I use the word individually—as being no longer necessary if the alternative provision under the new scheme were made for the people in that other way. So that it would not be a continued existence of things would be largely, if not entirely, unnecessary.

You feel that this unification or co-ordination will give the great advantage of the health of our country, some of many administrative conveniences of the present system?

If all this is done and the population, but income remains as at present, I think we shall have a very good thing.

[illegible]

ance bearing distributed that the cost of these as they stand now  
Fund?—I do not think we are in a position to answer  
that question. All we should like to claim for consideration is  
that the total national cost from all sources would not necessarily  
be much greater for the scheme which we have in mind than are  
the various services as at present distributed.

But it is important, it is not, to know whether you propose that  
these services, or mixed in the form in which it is raised now for  
—In so far as the people should be transferred to the one fund?  
schemes now would be provided for under some of the other  
I think it would have to be transferred to the Insurance Fund.

Would you be prepared to see a substantial increase in the State  
grants and the contributions of employers and employed persons  
in order to realize these aims?—We think probably there would  
have to be an increased contribution from employers and employed  
persons in respect of dependants; but we do not think there would  
need be any extra contributions from the State.

the extension of the service.  
Then you do not contest  
one fund?—

But one. And—The National Health Insurance Fund is a very big one. Do you not contemplate that they should all be met from contributions by the (National) Insurance Fund?—if you include State contributions in so far as the State would save money by the abolition of other things. *Dr. Dain*: The State and the rates contribute to the Child Welfare Centres and some of these other schemes.

This would no longer be necessary, or to a certain extent would not be necessary, and the money so saved would help to pay for the services given in the other way.

In the case of money saved by a ratepayer who is not an insured contributor, if it had all to be borne by the National Insurance Fund, the burden of that would be transferred to the insured contributor; is that what you contemplate?—*Dr. Brackenbury*: No. The ratepayer and the taxpayer at present run a school-treatment clinic. If the dependants of the insured persons were brought in, provision would be made for those same diseases under the Insurance Scheme, and it might be quite proper for the State to make to the insurance pool an increased contribution corresponding to what the State gained by the other provision not being necessary.

I am afraid I do not follow it yet. At the present moment you have got all the services that have just been described, the cost of which is defrayed in a variety of ways. If you unify or co-ordinate, or do both, so far as you can do both, to all these services, is the cost of these services still to be borne as it is borne now, or is it to be borne on the Insurance Fund?—It is to be borne on the Insurance Fund in so far as it refers to insured persons.

And in so far as it does not refer to insured persons, who is to bear it?—The State and the rates, as now.

So that the insured person would be contributing both as a ratepayer and as an insured person?—No more than now. This rather comes on the administrative side, where I feel there is some difficulty in our putting our meaning properly. We do not envisage all these things—insurance income, rate income, State grant, and all these other things being put into one pool and being left to the discretion of the local administrative authority to deal with. We imagine the Insurance Fund, dealing as it does with insured persons only, to be a separate financial matter.

At the present moment, insured persons do not, under the Insurance Scheme, get the advantage of many of those things which you now suggest they should have the advantage of as insured persons. They get the advantage of these just as other ratepayers get the advantage of them, quite apart from insurance. You recommend now that these services should become a definite part of the insurance contract, as it were?—Yes.

I want to know in what way the payment is to be made. Do you contemplate that in so far as the insured persons for the future take advantage of these, a grant should be made from the Insurance Fund towards the expenses of these services? Is that what you contemplate?—I have not quite got it now. It depends upon the inclusion of the dependants very largely.

I wish you would leave the dependants out of it for a moment. Take them as quite a separate proposition. You are suggesting that all the public health services should be co-ordinated, and many of them should be unified. That is what you are suggesting?—Yes; but that largely depends upon the inclusion of the dependants. If the dependants were not included it would not be worth while unifying the other things. *Dr. Cox*: These are the main things.

You envisage a scheme in which dependants are included?—*Dr. Brackenbury*: Yes. I do not say there should not be co-ordination and adjustment apart from that. But the scheme as a whole does involve the inclusion of dependants.

Whatever the scheme may be, you further contemplate that the only additional cost which should be thrown upon the National Insurance Fund as it now stands would be the cost in respect of dependants; is that so?—Yes; assuming the transfer of a similar amount of money from the State to the Fund.

Have you made any calculation what the additional cost arising from dependants would be?—Nothing that we could ask you to rely upon.

Would you be prepared to see a substantial increase in contribution on the part of employed persons and employers at the present time?—It depends on what you mean by "substantial."

Any?—Yes, for dependants; because at present the parent does spend money upon dependants in a considerable number of cases.

What about the employer?—I think it might be to the advantage of the employer to know that his employees were happy about their families.

It might be comfort, but how would it be to his advantage?—I think that would be an advantage. There I am speaking as a citizen.

I am asking you for your opinion as a medical man.—We have not come to any conclusion as to whether any, or how much, of this contribution should come from the employer.

Assuming that the country cannot face up to this expansion, could you indicate to us in a little detail the order of priority in which you would recommend the extensions of scope?—There we are bound to put before you the opinion of the profession by a majority. On the supposition that you hope to do both, but are not able to do both at once, they think the extension of the scope of the service should be given priority over the inclusion of dependants, according to the scheme. That is the opinion by a majority of the profession.

Is it a substantial majority?—There is a substantial minority. There is a big majority in favour of extension of scope of the service. On the other hand, the minority put it up to us that it is most urgent to get the dependants in.

It is part of your scheme, is it not, that the additional treatment benefits should no longer be administered by Approved Societies, and that these unequal and partial arrangements should be replaced by uniform benefits administered by local committees?—Absolutely.

Would you indicate to us what in your opinion are the main defects of the additional treatment benefits as at present administered by societies?—We have to be quite clear what we mean there. Of course, in the administration of societies under the Act

all a society can do is to contribute part or the whole of the cost of a benefit; it cannot arrange a benefit.

That is so.—But by what may be thought to be a dodge, if I might use that expression without intending to be offensive, Approved Societies amalgamate and constitute themselves another body, which not only pays the cost of benefit, but arranges for additional benefits being administered. To that, or anything approaching that, we have the very gravest professional objection; and one is bound to say that in exactly the same way as we made a very strong and eventually successful stand against the administration of ordinary general practitioners' treatment by an Approved Society, so in the interests of the consultants we shall have to make the same stand against the administration of additional treatment benefits of this kind by an Approved Society. Fundamentally, we object to the administration of these things which are health services involving the arrangement with and appointment of doctors to do certain things. We object to that being in the hands of any but a public body, unless it be a professional body, which, of course, we cannot look for. That is the big fundamental objection which the profession would certainly take a strong stand with regard to, if these additional benefits were to be developed along that line. Apart from that, from our point of view we think it is lamentable that a number of insured persons should be entitled to some of these things and their neighbours and friends should not be entitled to them. From the health point of view we think it is a great pity that all insured persons cannot secure alike these medical benefits, since they all pay the same premium.

It is better that some should secure them than that none should have them, is it not?—We are outlining what we believe to be the right sort of National Health Insurance scheme. We believe that under such a scheme there should be the same kind of medical attention available for all insured persons.

In paragraph 22 you suggest that with certain exceptions the additional services should be available only on the recommendation of the general practitioner, these exceptions being the prescribing of drugs and appliances and extra services by the consultant; and dental treatment. In all other cases, you desire the service to be given only on the recommendation of the general practitioner?—Yes.

Would you indicate to us briefly the reason for this differential treatment?—There are two points; both are quite simple. A consultant may be called in merely for the purpose of a consultation, to get his opinion of the case. After that has been obtained the treatment of the case goes on in the ordinary way in the hands of the general practitioner. But there are cases in which for a particular investigation or a particular line of treatment of a special character the patient is for the time being handed over from the general practitioner to the care of the consultant. In that case the consultant must have available at his call such laboratory facilities as may be necessary. With regard to dental treatment we are thinking mainly, if not wholly, of dental emergencies. You can scarcely expect an insured person with raging toothache to go to a doctor before he goes to his dentist to get it attended to. Although, generally speaking, we may hold with regard to the more chronic cases that the whole health of the person is involved, and, therefore, the general practitioner should be brought in in the same way as in the others, we must allow that there are dental emergencies in which direct access to the dentist should be allowed.

It would be difficult to distinguish between a dental emergency and something that was not a dental emergency?—That is so.

With regard to ophthalmic treatment, should that be on a different basis from dental treatment?—Yes. Primarily we envisage dental and ophthalmic treatment as merely individual forms of specialist and consultant treatment; we do not take them separately at all. We have to make that one exception in the case of dental access; but apart from that, dental treatment and ophthalmic treatment are simply individual forms of specialist treatment and ought to be considered *pari passu* with all other forms of treatment.

We note in paragraph 22 that you are prepared for two safeguards in connexion with recommendations for special services—namely, a notification to the administrative authority and a liability to explain to a professional committee the reason for any apparently excessive use. Do you think that the profession would accept quite willingly these conditions?—I think the profession would accept them as reasonable necessities.

In paragraph 24 you suggest certain criteria for determining the medical personnel of the consultant and specialist service. Do you feel that with these criteria there would be available throughout the country a sufficient number of specialists to meet the extended services which you contemplate, and that in particular there would be no difficulty in rural areas?—We have no doubt about that. We do not suppose that rural areas will always have the amenities of the town, but, generally speaking, there is no doubt about sufficient supply.

You realize that if the insurance contribution were increased in order to provide for specialist services, every insured person would have a right to expect these services to be available when required?—Yes.

In paragraph 28 you say that it is likely for some time to come that it will be necessary to continue the appointment of whole-time officers dealing with tuberculosis and venereal disease. Generally you are against payment by salary. Would you tell us why you would allow this method of remuneration to continue in these cases in your revised scheme?—It is not altogether or even mainly from our point of view a question of the method of remuneration. We have two objects in view in putting in that paragraph. In the first place we recognize that there are in existence a number of such officers and we do not want to jeopardize their individual positions; we want that to be taken into full consideration so that they shall not suppose or anybody else suppose that we want

them immediately displaced. The main point with regard to these two things is that we are scarcely yet as a profession and as a health community sufficiently developed to divide the functions among the proper elements. It involves the medical officer of health, the consultant, and the general practitioner. In all these cases with the progress of medical education the time will relatively soon come when the general practitioner will be able to undertake the medical treatment of those cases with the consultant's services at his disposal in time of difficulty. From the public health and administration point of view the medical officer of health will be able to supervise the general arrangements. The same with tuberculosis. We think it is desirable that as soon as that division of functions can be properly brought about it should be.

In paragraphs 29 and 30 you outline an interesting development for maternity work. This, I take it, would replace the present maternity benefit except that you would continue some cash payment in respect of maternity. Is this so?—Yes.

But in addition you would provide from insurance funds for the service at confinement and for any necessary pre-natal and post-natal attendance?—Yes.

In connexion with this question, have you anything to tell us as to the extent to which the present maternity benefit is entirely absorbed by the doctor's or midwife's fee?—It depends what you mean by "the present maternity benefit." If you are thinking of it as a whole, the whole sum available for maternity benefit, then there can be no doubt that it is not absorbed because the proportion of maternity cases attended by a doctor tends to be reduced year by year. The proportion of cases in which medical benefit is received by the person in which there is attendance by a doctor at all is relatively small.

But if there is not a doctor there is a midwife?—She does not absorb the maternity benefit.

Let us confine ourselves to the doctor. In most cases where a doctor does attend that is the fact, is it not?—Are you thinking of the individual person?

We are.—That the insured person's maternity benefit is absorbed by the doctor's fee I do not know. I do not know whether in fact by calculation that is so or not; I should suppose not.

We have had a considerable amount of evidence to that effect.—I know. There has been the suggestion that the doctor has sat down and calculated nicely what the maternity benefit was going to be and has raised his fee by a like amount. We are quite certain that no individual doctor in the country has ever sat down and made such a calculation.

The suggestion is that he has arrived at it instinctively.—Which is the more natural thing to do. There cannot be any doubt at all that the more money there is available from any source or for any reason whatever, the more does the doctor think that he ought to receive an adequate fee. We have to remember this, that in the old days maternity fees were altogether inadequate. This has also happened, that the cases which the doctor attends tend to be the more and more difficult cases. The normal cases, or cases which are hoped to be going to be normal, are more and more in the hands of midwives. The mother, assuming she thinks she is going to have a normal time, does not engage a doctor; she engages a midwife. If she happens to have an abnormal time the midwife can always call in a doctor.

That is not because the doctor's fee has become high, is it?—No. It is largely in those cases in which the woman has some evidence that she may have an abnormal confinement that she makes arrangements with a doctor for a specific fee. That of itself would tend to raise, and quite properly, the amount of remuneration which the doctor should have if more and more he has the difficult and abnormal cases rather than the normal cases to deal with. I would just say, incidentally, what certainly we should desire to emphasize, that of all the anxious and exhausting things a doctor has to do, a difficult confinement is the most anxious and the most exhausting. It is the hardest work that any doctor larger number of normal confinements than now, was low. It was out of proportion to the services rendered, because there was no money forthcoming. Therefore, on an increased abundance whatever, better wages or increased maternity benefits, or did undoubtedly and quite properly raise his fee; although I do not think there is anything in the suggestion that it was raised private practice and in other ways you find the same thing. In my own fees have been multiplied five times for such cases since the time of which I am speaking. I attend practically no maternity cases of insured persons now.

On what considerations has that rise taken place? The cost of living?—Not entirely. It is due partly to ability to pay. There is the feeling also that one does want an adequate return for services rendered and that you are more independent than you were before as to whether you will render the services or not. No doubt that is an element in it with doctors who have been in practice for a long time.

You rather think the explanation of the rise is that money being available the doctors have felt that they ought to be remunerated more in accordance with the merit of the service than they were able to be remunerated when money was not available?—That is so. *Dr. Bolam*: In the days before money was available to doctors was not really remuneration at all. The work was done largely on a semi-gratuitous basis. Midwifery has never been remunerated in accordance with the skill, care, and responsibility of the doctor; and, consequently, many doctors have had to give

up the work entirely. They do not feel it is just for them to go on doing the work without proper remuneration.

*Sir Arthur Warley*: Were they not properly paid in regard to normal cases?—Never in my professional life.

The midwife to-day in normal cases gets something more than the doctor formerly got for normal and abnormal cases?—*Dr. Brackenbury*: Very often. *Dr. Cox*: Before the end of the war there was a tendency in the ranks of the profession to increase the midwifery fee on the ground that it was a totally inadequate amount, generally speaking. That came to a head really in 1920, when we received from all over the country requests from doctors as to what they ought to do in regard to the rapidly changing value of money. They said they wanted a lead from headquarters. After consideration we suggested that all fees ought to be raised 50 per cent. That was in 1920. I believe throughout the country that was done. My own feeling is that midwifery fees on the whole are not more than 50 per cent. higher than they were in 1914. There are areas, of course, in which they are double, and some where they are treble. I remember in my younger days I used to do midwifery for half a guinea. The same man now gets 35s. That is three times as much. They were getting a guinea before I left the place.

*Chairman*: Have fees fallen since 1920?—I do not think so. I do not think they ever will. *Dr. Dain*: They did not go up more than 50 per cent., generally speaking.

The evidence we have had from different witnesses has been that they have gone up much more than 50 per cent.—*Dr. Cox*: Those must be exceptional cases.

I rather gathered from the evidence that I have listened to at any rate that there was a general rule to that effect, rather than an exception?—I do not know about that.

*Sir Arthur Warley*: The impression given was that fees had gone up from half a guinea to 35s.—*Dr. Brackenbury*: There are important areas in which the fees have gone up 50 per cent. No doubt there are other areas where they have gone up 200 or 300 per cent.

*Chairman*: At any rate you make the point, no matter how high they have gone up?—They are still inadequate for the services rendered.

I was not going to put it as high as that.—That is the position. *Dr. Dain*: Having regard to the evidence which has been given to the Commission, we are anxious that this point should be cleared up.

So are we.—It has been put in a very objectionable way; that the greedy doctor simply took the money as it became available. No regard has been had to the particular circumstances that in the last twenty years doctors have left off attending midwifery in favour of the development of a service of qualified midwives. In my own practice twenty years ago I might attend 200 cases a year. I worked very hard. To-day my partner and I do not attend 50. That is not because we refused anybody; we go to anybody who asks us. We get a fee of £2 2s. where we used to get a guinea. We get, as *Dr. Brackenbury* has said, only the difficult cases. The patient does not engage a doctor in any case. She comes and says, "If the midwife is in trouble will you come?" And, of course, we say "Yes." I regard with great indignation the suggestion that I am out to get all the benefit. As a matter of fact, I do not get midwifery fees out of more than a fourth of the patients I formerly attended in the same neighbourhood, with an increased practice. The normal work is done by qualified midwives, and is properly done. There is a constantly improving service of midwives. As one is getting older one does not want to do so much.

*Sir Arthur Warley*: If the midwife is giving a proper service for a little more than the doctor got before, presumably the doctor was not properly remunerated before?—*Dr. Brackenbury*: That is so.

Therefore the whole of your case comes down to two points, does it not: (1) the normal cases are done by midwives and you get the abnormal cases; (2) there being more money in the house, you think you ought to get more?—Yes. *Dr. Dain*: It is to be remembered that the public authority undertakes the responsibility for the midwifery service. The Medical Officer of Health will pay for the attendance of a doctor on confinement in any case where the patient is unable to pay. The doctor puts in a claim. The scale has been agreed at a much higher level than pre-war.

*Chairman*: Probably the impression of the doctors taking advantage of the higher payments in order to get a higher fee has arisen partly from the fact that the insured person regards the increased maternity benefit as a payment made to her irrespective of any appropriate remuneration for the doctor?—Yes.

And, therefore, she has been inclined to think the doctor has taken advantage of the situation to get what she ought to be getting. I think the difficulty lies misce perhaps in that way. What I was hoping to get was an expression of opinion from such a responsible body as yours as to the merits of the payment that might be made in such cases. As I understand your explanation, it is that in the old days, money not being available, doctors had, since they felt compelled from the professional point of view to attend any case that came along, often to be content with a fee which was inadequate for the services rendered?—Yes.

And that they now do not accept any blame for asking that the fee, when money is available, should be more appropriate?—That is so. *Dr. Bolam*: I want to make it perfectly clear that this is not an attempt to grasp a relatively high fee for the service because there happens to be a payment which can be converted as remuneration for that fee. We want to make it clear that even now midwifery work is not adequately remunerated.

At the higher fee?—Yes. *Dr. Cox*: We regarded this matter as so important that a few days ago we made inquiry from a few typical areas, not selected ones, on the point. We did not know what the replies would be. We asked three questions: what was

the pre-war midwifery fee in your area; was the fee raised in 1920, and, if so, to what figure; what are the fees now? I would like to give the Commission information on this point. Manchester said the pre-war fee was a guinea; in 1918 it was raised to a guinea and a half; in 1919 or 1920 it was raised to £3 3s.; it is now £3 3s. or more.

That is three times the amount?—Hertford says: The fee was supposed to be raised 50 per cent. in 1920. The honorary secretary thinks not less than £2 2s. is now charged for any confinement, and that there has been no drop since 1920. £2 2s. is the fee for an area which is largely agricultural. Winchester says: the fees were advanced during the war, and have not dropped; the basic fees appear to be £1 1s. to £2 2s., increased now to £3 3s. or £4 3s.

The variety of increase may help to raise questions?—Dr. Brackenbury: The same raising of fees has occurred in private practice, in cases where maternity benefit is not involved. Dr. Cox: That is so. Dr. Brackenbury: If you investigated the cases where there was no maternity benefit, you would find the fees were raised in the same proportion.

Do you think the fees have been raised to three times the amount?—Yes. Dr. Bain: There are many districts where the fee is £3 3s.

For what?—For attending on midwifery cases. Dr. Cox: May I complete my information? The next group comes from North Wales, where they say the fee was, up to 1920, 10s. 6d. to £1 1s., I suppose varying with the circumstances of the patient. They now say it is £2 2s., if it is a difficult case, or another practitioner has to be called in. In Penryn it was half a guinea before the war; it was raised to a guinea in 1920, and is still a guinea. In the Dolgelly district the fee was one to two guineas before the war, whether it was the first confinement or not. There they say the fee has never been raised. In the Towy district, not far away from Dolgelly, the fee was a guinea before the war, two guineas if the distance was over four miles. It has never been raised at all. In Buckinghamshire it was a guinea before the war, now one and a half guineas. In Bedfordshire the fee was a guinea before the war, now it is one and a half to two guineas. Those are varied areas, and are the only districts which have replied in time. They show a variety of charge. The fact is that the fees before the war were low.

The very fact of such variety of charge in respect of a matter where there has been a uniform increase in payment to the insured person may itself help to raise questions which have been raised by a number of witnesses?—If they are under the apprehension that this rise has only occurred in cases of insured persons; but that is not the case.

Whether they are under that apprehension or not, they are likely to assume that persons who are not insured persons can afford to meet any reasonable rise, whereas persons who are insured persons cannot do so above the amount of maternity benefit. That is the assumption they are likely to make?—That is surely what the benefit was intended for. It was to meet the necessary expense of confinement. If the doctor's fee is not a necessary expense of confinement, what is?

Sir Arthur Worley: Is it not the fact that before the war there was an almost uniform charge?—No, it varied very greatly; there is the same relative variation now. Dr. Brackenbury: Seeing that you have to allow that you cannot go below a certain minimum anywhere, I think that is so. There would not be quite the same range.

There were not many cases above a guinea before the war, were there?—Many.

I had in mind the list of districts Dr. Cox read.

Chairman: What do you say, Dr. Brackenbury, to the disparity in the different districts?—It has always been so.

Even supposing that has been the case, there is a great disparity in percentage rise. In some of the districts Dr. Cox mentioned they have not raised the fees at all. The fees could not be said to be inordinately high; they were quite low in some cases; but they have not raised them at all. In some areas they have raised them 50 per cent., in some 100 per cent.—I can only say that the doctors in some areas are wiser than in some other areas. Dr. Balam: In some of these areas it is quite possible there is a miners' system under which there is payment for the whole family, and the maternity fee is low in consequence. Very often that is the case.

Those are not merely insured persons' fees?—Dr. Cox: No.

Those are fees generally, private and insurance patients?—Dr. Balam: But in such an area all the people would be of practically the same class. Dr. Cox: There is no compulsion about these fees; it is only the secretaries' estimate.

Professor Gray: With regard to the area where the charge is £3 3s., that would apply to an insured person also?—Yes.

Sir Arthur Worley: Might the doctor give more attendance after the event in some districts?—Yes. Dr. Balam: In some cases it was specified what the period of attendance would be.

After the event some doctors used to go three or four times for the fee?—Dr. Cox: I know of two areas quite close together where one doctor adopted the practice of dropping in up to the end of the month for an inclusive fee, whereas all the other men distinctly said ten days. Ten days is the usual period, I believe. Dr. Bain: I think it will be found on an analysis of some of those figures that where there has been no increase there has been no improvement in the service of midwives. In areas where the men are attending less cases the tendency is for the individual fee to be raised.

Chairman: Do you care to express any view as to the periods before and after confinement during which a woman who abstains

from work should receive money payments?—Dr. Brackenbury: It depends what that means. We think circumstances of employment vary so enormously in different cases that it would be impossible to suggest an average period. If it was a question of a sum being paid for a short period before and after confinement we should suggest a month.

A month before and a month after?—Yes.

Perhaps you would amplify for us a little the reasons for your proposed condition that any insurance practitioner should be at complete liberty to undertake or to decline this work? Do you regard attendance at confinement as something not necessarily within the province of the general practitioner? You do not make any other exception of this kind?—No; we do not remove it from the category of those matters which are within the province of the general practitioner at all; there is no thought of that. The anxieties, responsibilities, risks, and all the trouble of this class of work do make certain doctors say: "This is the first part of my work I will cut off; I can cut it off as a separate entity." As a doctor gets older and perhaps more successful he says: "I will not take confinement cases any more; I do not want to be held so tightly to my practice as this holds me." It is not a question of having to get out of bed at night. It is merely the feeling that if you are waiting for something you are tied for days; you dare not be away. Taking all those matters into consideration certain doctors say: we do not propose to take on any work of this kind in future. We think that that right should be preserved under any insurance arrangement.

In paragraph 31 you outline arrangements for a clinical laboratory service. Would the arrangement for payment here be that, if on the advice and request of the general practitioner a report or an analysis were made, the management of the laboratory would simply send a bill to the local health authority in accordance with a prescribed scale?—Yes; the local health authority here being whatever authority was established for the administration of the system.

In paragraph 32 you deal with institutional treatment arrangements. I note that you are of opinion that payment should be made out of National Health Insurance funds in respect of all insured persons who receive treatment at hospitals, whether as in-patients or out-patients, and that such payment should include a charge for the remuneration of the medical and surgical staff of the hospital. Is this so?—That is so.

Do you suggest that each approved society should make payments out of its own funds for each member of the society who receives hospital treatment, or that every society should contribute on a membership basis to a central fund out of which all payments to hospitals should be made?—Certainly "No" to the first part of the question. That depends how you arrange the matter. What we envisage is, for the payment of the premium the insured person shall be entitled to hospital treatment so far as accommodation allows of it, and that that should be paid for out of the insurance pool. Whether that pool were built up in the particular way which is suggested in this question or whether it were a pool quite apart from it being passed through the books of the approved society at all does not really concern us fundamentally. We had rather thought of it not passing through the approved society's books at all.

Would you agree that a member of a society which makes payments in respect of the hospital treatment of its members should have some advantage in the matter of hospital treatment over a person in respect of whom no such payment is made, and if so, what form do you think this advantage should take?—There would be no such question as I have just said. There could be no advantage. All the societies would equally contribute, or the pool would be independent of the societies.

When you speak of a pool you mean a general pool?—Yes. Dr. Balam: The only criterion we would acknowledge in the case of a hospital would be the need of the patient, not whether payment had been made beforehand in respect of the patient or not.

In paragraph 33 you suggest that the list of prescribed appliances should be extended. Do you find that the restrictions of the present list have to any extent hampered general practitioner work under the Insurance Scheme?—Dr. Brackenbury: Yes, to some extent. What we should try to think out if we could would be appliances which are necessities and appliances which might be described as luxuries. It is, of course, difficult to draw a line there as it is difficult to draw a line anywhere. I think all the appliances that can be described as necessities should be available to the insured person under the doctor's prescription out of the Insurance Fund in respect of his payment. If you can describe certain other appliances as luxuries it may be proper to leave them to the surplus funds of the societies. With regard to trusses particularly and elastic stockings we should regard those as rather necessities than luxuries for the treatment of the patient. We think they ought to be available. It hampers us not to be able to secure them without considerable work and trouble.

Miss Tuckwell: With regard to the Chairman's question, I understood from something said earlier that you would be in favour not only of additional benefits but of all benefits being taken away from approved societies?—All treatment benefits, all those of the nature of health service.

I want to ask you one or two questions with regard to midwifery. If midwifery needs so much skill and care, is it safe to leave all normal cases to the midwife; they might become dangerous?—Yes, except for this reason, that the more the normal midwifery is taken out of the hands of the general practitioner the less skilful will the general practitioner be in the conduct of midwifery in general. The danger is a too great removal of normal cases from the experience of the general practitioner. If you could ensure a normal confinement (you cannot

do that really) I have no reason to suppose that a qualified midwife could not conduct it properly.

Then the growing practice of doctors leaving all apparently normal cases to midwives is fraught with danger?—It is not a case of the doctors leaving them to midwives; they are taken out of the doctors' hands. Doctors do not say: "We want to repudiate these cases." They do not get them.

I thought you said that the doctors were increasingly leaving those cases to the midwives?—No. *Dr. Dain*: The position is this. The patient chooses a midwife to attend her, with the option of calling in a doctor if there is any difficulty. She does that on account of cost.

I am quite sure that was said, but I think the other point was put too, that doctors, men in particular with increasing practices, and who do not want to be called up at night, were inclined to leave those cases to the midwives?—*Dr. Brackenbury*: They are more inclined to leave them than the younger men; but if you are speaking of the profession generally it is not true.

You think that the reason why a registered midwife is being employed to an extent which I gather is dangerous is because a doctor is not called in?—Yes, generally speaking, that is so. Doctors would be willing to attend a far larger proportion of normal confinements than they do.

Into that the question of cost comes?—Yes. So the fact that a woman cannot afford to pay three guineas is really a menace to the health of the mother?—I think you are putting it rather high to call it a menace. There are possible dangers attached thereto.

Serious dangers if a normal case might at any moment become abnormal?—On that point the midwife has the right of calling in a doctor; but it is a disadvantage to be called in only at that time without any previous acquaintance with the case, and without any knowledge of what has been going on.

I am not asking heckling questions. A good many of my friends are interested in this matter. I was seeking to elucidate the position, which seems to be one of menace.—I am assuming that all questions are put from the point of view of elucidating the position. I do not know if I am right. *Dr. Cox*: When you mention three guineas I hope you will not forget the fact that there are many areas where the normal fee is only two guineas.

I have that in mind. In any case, we know that the benefit which the mother receives does not enable her to pay the doctor the sum which you feel his skill and capacity warrants and at the same time do anything for herself?—*Dr. Brackenbury*: I do not think any contribution would do that.

Out of your great knowledge of industrial life have you any suggestions to make as to how this difficulty is to be met?—I think, perhaps, you might put these questions to *Dr. Dain*. *Dr. Dain* knows more about industrial practice than I do.

Very well. *Dr. Dain*, you must have had enormous experience of poor homes, and you must know what the needs are in such a time as confinement. It may be quite right that the money given as maternity benefit should be absorbed by the medical man. If it is not absorbed altogether, then it goes to the midwife. Have you any suggestion to make as to what can be done in such a case?—*Dr. Dain*: Have you read the document which we submitted on the subject of maternity benefit, that instead of it being a maternity benefit it should be treatment, so that the mother would be entitled to what we consider the minimum midwifery service, maternity service as well as maternity benefit?

I have read the document with great care. That would be an arrangement outside the insurance provisions. I am thinking of a poor home. Perhaps there is very little in the house to meet the needs of confinement?—In answer to that question we do not consider that the National Health Insurance Scheme could properly be expected to provide in every case for a midwife and doctor. We think the interests of the patient would be better served by qualified midwife with power of calling in a doctor and consultant as required in specially difficult cases. At the present time the poor woman of whom you speak, whether her husband is insured or not, who finds herself in difficulty, and the midwife cannot manage, can call in a doctor. The doctor's fee is no concern of maternity benefit. The doctor does not encroach upon the maternity benefit at all. If the home was so poor that they satisfied the Medical Officer of Health that it is a necessitous case, he will pay the doctor's fee entirely.

You do not feel satisfied that this is all that can be done, but you feel that under National Health Insurance it is all you can suggest?—It is not the ideal.

You said that you felt a month's rest before and a month's rest after maternity is desirable. Have you any experience as to whether women are more and more taking sickness benefit for a longer period before confinement than was usual in the old days?—We have this experience, that women are finding out that pregnancy is a disability, and that they may be able to persuade the doctor that it is such a disability that they can draw sickness benefit for as long a period as possible. Many women go to the doctor in the first month, not recognizing that they have to prove there is some disability, that they are incapable of work as well as pregnant. After the confinement the tendency is greater for women to turn up at the end of the month and say to the doctor, who has never seen them during maternity at all, that they have been confined and that they are still unable to work. Then the doctor has to decide whether it is a real disability and if so to certify the woman as incapable of work.

A great many women like to work up to the last moment. Are you finding the habit of claiming sickness benefit for long periods increasing?—Yes.

*Mr. Jones*: As I understand your scheme you would give every doctor the right of being on the midwifery panel?—*Dr. Brackenbury*: Yes.

And you would give every doctor the similar right of declining to undertake such work?—Yes.

What would you do in the case of a district where all the doctors declined to undertake this class of work?—I do not think that is an objection we should take much notice of because I do not think it is likely to mature; I cannot conceive of it maturing, and I think it is a pity to discuss theoretical contingencies.

If I were to tell you that twice in my experience in a busy city that difficulty has been acutely felt, what solution would you suggest?—I should really doubt whether all the doctors in Glasgow had refused to attend maternity cases.

I did not say that all the doctors had done so, but that in two important districts of a busy city that difficulty had been acutely felt.—I think there are many doctors available.

If I told you that I circulated all the doctors within a particular area within which one might say there were 100,000 people and that I got promises from perhaps 50 that they would be willing to undertake this work, what do you say?—*Dr. Dain*: I suggest you call the doctors in the district together and ask them what they propose to do. I think they would offer an arrangement straight away. *Dr. Brackenbury*: The calling in of a doctor by a midwife is a different thing from declining to undertake midwifery practice.

If I found it was impossible to get doctors to undertake this class of work in another part of the city, what do you suggest as a solution of the difficulty?—Do you mean it was impossible to get doctors on any terms?

Yes. *Dr. Cox*: I cannot imagine a doctor catering for general practice being able to face public obloquy and the certain risk of loss of income which would fall upon him by such a refusal.

I am not drawing on my imagination. I am stating a specific instance.—*Dr. Dain*: We can conceive that individual doctors might as individuals each refuse to attend midwifery cases; it might so happen that doctors over a particular area might refuse such cases; but if it was put to them from the public point of view I am sure it would be done. I do not think that the doctors as a body would refuse to undertake such a responsibility. Perhaps the individual doctor would, but being faced with the difficulty that the public could not obtain this service, I have no doubt all the doctors would give it by some method or other. *Dr. Cox*: I would like to say, having put up this proposal for a maternity service, that we would be quite willing, if our suggestions were accepted, to have it made part of the duties of the doctors of the area to arrange for this service just in the same way as they arrange for the medical service.

You have anticipated my next question. You are wanting the doctor to have full liberty. I was going to ask: What are you prepared to do for the insured person?—*Dr. Dain*: I think you have not appreciated the fact that we are offering the insured woman, not a choice of the doctors on the panel, but any doctor who is willing to undertake maternity cases, non-panel as well as panel doctors. *Dr. Brackenbury*: We are prepared to guarantee, even by compulsion, by law (although I do not see how that could be carried out), that in every case there shall be a maternity service of doctors in the same way as there is a medical service. I think if the situation was put to the doctors there would be no need for compulsion. They would arrange amongst themselves that there should be such a service for insured persons. I do not doubt it for a moment. I should not mind any legislative power being given to see that there was such a service.

Your assurance is quite sufficient for me. Some years ago in Glasgow it was quite impossible to get general practitioners to attend maternity cases. I approached every doctor in the area and I placed on the list all those who gave me authority to add their names, and still the scheme broke down. Within the past month I have had complaints of the same difficulty arising.—Was there any administrative difficulty in enrolling out the arrangements?

None whatever. There was no difficulty about the terms. *Dr. Brackenbury*: If any such circumstances were brought to our notice we should exert our authority to overcome the difficulty. I do not think there would be any difficulty if you got the local doctors together as a body and explained the position to them. *Dr. Cox*: We suggest that if you adopt our scheme you will get rid of all that.

*Chairman*: I think you gentlemen agree that apart from the scheme, it is a difficulty which must be dealt with?—*Dr. Brackenbury*: Most certainly.

*Professor Gray*: You have indicated that your ideal is to remove all treatment benefits from societies?—Yes.

You referred to a particular method by which treatment benefits were being given by certain societies. I presume you referred to Section 26?—Yes.

Is it not the case that treatment benefits are given quite apart from that section?—The only such additional benefit which is legal is a contribution in cash. There is no power for societies administratively to make arrangements for these things to be done. All they can do is to contribute part or the whole of the cost of treatment. They have no legal power whatever to arrange for that treatment. By combining together into a society which is called a charitable one they secure, doubtfully perhaps, the administrative arrangement by which they can arrange for this treatment not merely contributing in cash. I do not think there is anything outside that.

Your point would hardly be met by the abolition of Section 26, because you would still have the same grievance with regard to other additional benefits. Is not that so?—I do not think the mere abolition of that section would meet the case.

You object to the whole thing?—Yes.

To both sides of it?—If the additional benefit is a cash sickness payment we have nothing to do with that.

I am speaking of payments in respect of treatment.—With regard to payments in respect of treatment, we must insist, forgive me the word, that that shall be under public and not under Approved Society administration.

A further point you took in connexion with that was this: that under present arrangements there was complete lack of uniformity as between one society and another.—Yes, and as between branches of the same society.

How far do you recommend the Commission to go to meet that point? At present is it not the case that the funds belong to the societies? Are you recommending a levelling up of all the societies so that all get the same benefit?—The word "belong" has such different connotations.

Quite. I was wondering how far you are prepared to go, or how far you have thought out the matter of the reactions of your suggestions on the scheme as it stands.—The societies would say that it involves robbing them of money which they considered was theirs. I should say there were certain funds available which were intended for these things, and ought to be administered for all insured persons alike, and that the passage of certain moneys through the books of certain societies was more or less an accident; that, moreover, at the beginning the state of affairs which is now evident was not foreseen; that huge accumulations of money were not foreseen; and that if Parliament had foreseen it they would have been dealt with in quite a different way; moreover, that what the societies were promised, as we understand it, was that good administration should carry its reward to the Approved Societies which were well administered. I do not think it was ever thought that that applied to the segregation of healthy lives in particular societies and the forbidding of entry into those societies of lives which were not so good. Certain societies of a small and select character have carried with them per member a relatively enormous surplus at the cost of those unfortunate persons who belong to other societies which do not so segregate themselves. I do not think that kind of thing was understood to be included in the term "good administration." Taking all those matters into consideration, I do not think we can say that the money belongs in the full sense to the societies, or that Parliament could be accused of robbing the societies if it enacted new schemes which distributed the funds differently.

You say these things were not foreseen. As you realize, the whole scheme of things in 1911 was based on the idea of separate societies?—Yes.

I have before me an extract from Mr. Hobhouse's speech. Speaking on behalf of the Chancellor, he said the whole of the saving arising from the better standard of health among the members of any Approved Society will remain in the hands of the society for additional benefits?—Yes.

That is one of the many passages which can be dug out of Hansard?—Yes.

So that it might be said that these inequalities were foreseen, to some extent at any rate?—I do not think the significance of some of those politicians' statements was well thought out or understood. I do not think it could have been intended that a select company of clerks could segregate themselves and get additional benefits at the rate of £7 per member, and that certain other people—for instance, miners—should be left to make the best they could of their bad jobs.

Chairman: Might I give another reference? This is Mr. Lloyd George: "How is this surplus to be made? It will be made more out of good management than out of good lives."—Quite. Over and over again it was said that good management should carry its own reward. If other things were said by politicians, I do not think they could have been well meditated beforehand.

Professor Gray: You rather indicated, did you not, that this large extension of benefits which you proposed was rather linked up with the extension of dependants?—No; you can make this extension to all existing insured persons without bringing in the other question as to who the insured person should be.

I thought it was linked up with it?—No. The cost of the combined service is linked up with it.

One question on your ideas of dentistry. You suggest that the insured person should have direct access to the dentist on the ground of humanity?—Yes.

Would you adhere to that irrespective of the amount of treatment desired?—No. We say there would have to be safeguards with regard to dental treatment.

Would I be right in saying that your view is this: that in the normal case where there was a lot of work to be done, the case should go through the doctor, but that in the case of emergency or pain the insured person should be allowed to go to the dentist?—That is so. I do not think the mere going through the doctor would necessarily be a safeguard against improper expenditure.

Probably not. With regard to dentistry itself, what are your views and the views of the Association with regard to the importance of dental treatment in connexion with its reaction on sickness experience?—We regard it as important, but we regard it as on a par with extensions to other specialists altogether.

You do not suggest that most of the illnesses from which we suffer are in fact the result of imperfect teeth?—I do not. If I may take an illustration which will be understood, we very often find a man or woman suffering from some form of self-poisoning. We investigate every corner of the body to try and discover the source of that toxication. The three common sources are teeth, naso-pharynx, and bowel. We do not regard it as any more important that a man or woman suffering from one should

be treated than from the others; and in so far as special provision of treatment is rendered necessary, we think they ought to go together, and that dentistry should not be given priority over the rest.

In the event of extension to dentistry, would your suggestion be that there should be a panel of dentists like a panel of doctors open to all dentists on the Register?—Yes.

Irrespective of class?—I suppose that is a question which should be directed to the dentists and not to us. You cannot, I suppose, make any distinction between one kind of person on the Dental Register and another kind of person. It may or may not be desirable.

With regard to the corresponding point as to oculists, you mention in an appendix that you have grave doubt about certain things. Your view is in the case of ophthalmic benefit the insured person should be seen always by a competent medical practitioner?—Dr. Boham: Might that point be left to the next sitting, when Mr. Bishop Hannan will be here?

Chairman: Certainly.

Professor Gray: I am not sure what is implied under your new scheme of maternity benefit. As I understand it, you desire to retain a cash payment?—Dr. Brackenbury: Yes.

Have you thought what that would be?—No.

Over and above that you want to give the insured person treatment throughout the whole of pregnancy?—Yes.

Together with attendance either by a doctor or a midwife; is not that the idea?—Yes, a doctor certainly, if there is any abnormality arising.

One point troubling me is whether you would allow a woman to have either a doctor or a midwife; and how you would meet the trouble which would arise if in fact all the women chose doctors?—I thought we had made that quite clear. We have deliberately ruled that out as an impossible thing. We think that it would not be possible or feasible to suggest that under National Health Insurance there should be the choice of a doctor or midwife in every case, because no doubt the larger proportion would choose a doctor if there was no expense.

A better service?—Yes. Inasmuch as the cost would be very much greater, and inasmuch as the present system appears to work without serious disaster, at any rate, we do not think we could properly put that forward as a demand of a National Insurance Scheme. What we think there ought to be is what there is not now: an association of a particular doctor with every case of maternity.

In the case of pregnancy, I take it, a woman can get medical advice during pregnancy from her panel doctor right up to the period of confinement?—Yes.

She already has the option of medical treatment throughout her pregnancy?—Yes, but the doctor may not be the doctor who is going to attend her during confinement.

Quite so, but he is obliged to advise her and attend her?—Yes.

Right up to the period of confinement?—Yes.

So there is a doctor there?—Yes. We are anxious to secure that the doctor who would in fact attend her during confinement, if a doctor was necessary, should have had some previous knowledge of her case, and had had with her consent the opportunity of making a pre-natal examination.

Is your point that you desire these women to go to the doctor whether they are ill or not? At present they go to the doctor if they are not well, but they may not think they are ill and may not go.—At present the midwife can call in any particular doctor she likes. We should like the midwife to have got into association with some doctor, so that he should keep an eye on the case and attend the patient in her actual confinement if necessary.

Sir Arthur Forley: Dr. Brackenbury, you have been scrupulously fair all the way through. I want to ask you a question to clear up something that was said with regard to midwives. I take it you would agree that during the last few years there has been a considerable increase in the training of midwives?—Yes.

And that therefore, as between a doctor and a midwife, the percentage of danger in normal cases is small?—Yes. That is why I objected to the word "menace."

I know. I wanted to get that clear.—That is the position. There is a source of danger, but we do not regard it as a large one.

It is a possible source, but if placed into figures it would be a very small percentage?—That is so.

That is what I wanted to ascertain. Dr. Dain: A properly trained midwife is competent to recognize if there is any necessity to call in a doctor. She is competent to recognize when the case is going wrong. That should be part of her training, that she is capable of recognizing that.

A properly trained midwife can and should always be able to detect if anything is going wrong?—Yes; she should be able to recognize if the case is abnormal. Dr. Brackenbury: And such dangers would be minimized by our scheme, because instead of the midwife waiting till that circumstance arose to call in the doctor there would be a particular doctor who had undertaken to be called in at that stage, who would have been brought into personal contact with the case in the earlier days.

Anyhow, it is a small matter in percentage?—Yes.

You want to guard against that small percentage as far as possible?—That is so.

You are not casting any doubt on the skill of the present-day midwife?—Not at all.

Mr. Jones: Might I put one further question? These midwives work under stringent rules, do they not?—That is so.

Chairman: We will resume our discussions this day week.

## British Medical Association.

## CURRENT NOTES.

## Puerperal Morbidity and Mortality.

The special committee appointed by the Council of the British Medical Association met for the second time on May 13th, when there were present Sir Ewen Macdenn (in the chair), the Chairman of the Representative Body, the Treasurer of the Association, Mr. Camvyn Berkeley, Drs. J. W. Bone, G. F. Buchan, C. E. Douglas, Christine Murrell, Mabel Ramsay, and W. E. Thomas, Mr. E. B. Turner, and Sir Jenner Verrall. The Committee had before it various documents connected with the subject of its reference, including the report of the Scottish Departmental Committee on Puerperal Morbidity and Mortality, a report of the recent meeting of the British Congress of Obstetrics and Gynaecology, and a memorandum by the chairman making certain suggestions as to further lines of inquiry. It was resolved to obtain statistics as to Ireland and the Dominions. The Committee spent a considerable time in discussing the report of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine on puerperal fever notification, which was referred by the Ministry of Health to the Association for its comments (see *BRITISH MEDICAL JOURNAL*, April 25th, pp. 770-777 and 779-784; May 2nd, pp. 830-834; and May 9th, p. 891). In response to the request, published recently in this column, for suggestions as to possible lines of inquiry, some letters have been sent in by members. The Committee has found them very useful, and would be glad to consider any further suggestions on the subject that may be sent to the Medical Secretary.

## Medical Officer of Health for Paddington.

The borough of Paddington is advertising for a medical officer of health at a commencing salary of £1,000, rising by £50 in each alternate year to £1,250. The population of the borough is estimated at 146,200, and in the scale of commencing salaries the salary for a medical officer of health for a metropolitan borough with a population not exceeding 150,000 is between £1,000 and £1,200. It was feared at the time the final modifications were made in the scale that attempts would be made to use the lower figures in the range when the higher figures were clearly indicated, but there seems no excuse whatever for the Paddington Council. Obviously the commencing salary should have been £1,200 or very near it. A protest has been made to the borough council, but without success, and the Ministry of Health has accordingly been requested not to give its approval to the appointment. The British Medical Association and the Society of Medical Officers of Health feel that if a borough like Paddington is allowed to evade the scale in this way, there is no reason why any other authority should offer to pay anything more than the lowest rate within the scale. As the Paddington Council has declined the offer of the Ministry of Health to arrange for a discussion with the Association, it is hoped that candidates of appropriate standing for the medical officership of such an important borough will refrain from applying until Paddington complies not only with the letter but with the spirit of the new scale.

## Lancashire £1,000 Fine Case: The Minister of Health's Decision.

It will be remembered that in December, 1923, the Minister of Health fined two doctors in Lancashire £1,000 for charging fees to insured persons.<sup>1</sup> The Insurance Acts Committee has upon several occasions made representations to the Ministry to the effect that the fine inflicted was excessive and out of proportion to the offence committed. The Committee recognized that the practitioners concerned had committed a very serious offence, but the fine was, in its opinion, unduly heavy in view of the findings of fact by the Court of Inquiry. Since the infliction of the fine the Insurance Acts Committee has repeatedly expressed to the Minister its belief that the case had caused great uneasiness in the National Health Insurance Service, and urged that an act of leniency on his part would be appreciated, not only

<sup>1</sup> SUPPLEMENT, December 22nd, 1923, p. 277.

by the doctors concerned, but by the profession generally. The two doctors concerned having expressed their regret at the breach of the regulation which they committed, and having informed the Minister of their intention to observe such regulations carefully in the future, the Minister has now informed the Insurance Acts Committee that he has given instructions that no further deductions are to be made from the remuneration of the two doctors. In making his intention known the Minister stated that he had given weight to the consideration that the action taken in this case had been sufficient to make clear the very serious view entertained by him and his predecessors as to the practice of charging additional fees to insured persons for services which the practitioner is under contract to render. The result of this decision to the practitioners concerned is in effect a remission of practically half the amount of penalty, and costs which they had incurred. The Insurance Acts Committee has expressed its satisfaction at the Minister's decision, and has been warmly thanked by the doctors on whose behalf the representations had been made.

## Ophthalmic Benefit for Insured Persons.

Important discussions have recently been going on between representatives of the Insurance Acts Committee (accompanied by members of the Ophthalmic Committee of the Association, the Council of British Ophthalmologists, and the Ophthalmic Benefit Committee) and the Ministry of Health regarding the method of providing insured persons with treatment for defects of the eyes, and an arrangement has been made which comes into force on July 1st. Members of those approved societies which provide ophthalmic benefit must, in the first instance, consult their insurance practitioner, who, in suitable cases, will give them a recommendation to their approved society to the effect that the symptoms found arise from defects of the eyes or call for examination and report on the condition of the eyes, and that the society should refer the patients to an ophthalmologist on the approved list. This "approved list" is to be supplied and maintained by the British Medical Association, and is to contain the names of medical practitioners who satisfy certain now familiar criteria which will be found in detail in paragraph 24 of the Evidence of the Association presented to the Royal Commission on National Health Insurance (SUPPLEMENT, February 28th, 1925, p. 73). Besides satisfying these criteria doctors on the list must be willing to accept an inclusive fee of £1 1s. for each insured person sent to them by approved societies. The list already contains some 500 names, but any practitioner possessing the necessary qualifications may apply at any time to have his or her name placed thereon. Applications should be sent to the Medical Secretary, British Medical Association.

## Treasurer's Cup Golf Competition.

The winner of the first stage of the above competition in the area of East Herts Division is Dr. W. H. Sturge of Hoddesdon, whose name was inadvertently omitted from the list published in last week's SUPPLEMENT.

## Association Notices.

NOTICES OF MOTION BY DIVISIONS FOR THE  
ANNUAL REPRESENTATIVE MEETING,  
BATH, 1925.

*Practice of Psycho-analysis by Medical Practitioners.*  
By SUSSEX: That the Representative Body instruct the Council to consider certain practices alleged to be prevalent among some medical men practising psycho-analysis, and to report.

[This is an amended form of the Motion by Sussex printed on page 203 of the SUPPLEMENT of May 16th, 1925.]

*Practice of Medicine by Unqualified Persons.*  
By ST. HELENS and WARRINGTON: That (with reference to para. 109 of the Annual Report of Council) the Representative Body is of the opinion that the policy adopted by the Association in 1906 (see para. 105 of the Annual Report) should be resuscitated in so far as that the Medical Acts be so amended in the near future that no unregistered person be allowed to practise medicine or surgery.

## TABLE OF DATES.

- May 30, Sat. Publication in SUPPLEMENT of results of Council elections by grouped branches, and of election of members of Council and Representatives in Representative Body by Public Health Service members. Nomination papers available for election of 12 members of Council by grouped Home Representatives.
- June 4, Thurs. Names of Representatives and Deputy-Representatives must be received by this date.
- June 10, Wed. Council Meeting.
- June 18, Thurs. Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.
- June 27, Sat. Supplementary Report of Council appears in SUPPLEMENT.
- July 3, Fri. Amendments and riders for issue in A.R.M. Agenda must be received by this date.
- July 17, Fri. Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M. Bath) by this date.

ALFRED COX, *Medical Secretary.*

## BRANCH AND DIVISION MEETINGS TO BE HELD.

**BIRMINGHAM BRANCH: NUNEATON AND TAMWORTH DIVISION.**—The fourth annual dinner of the Nuneaton and Tamworth Division will be held at the Castle Hotel, Tamworth, on Thursday, May 28th, at 7.45 p.m. Annual meeting of the Division, Tamworth Hospital, Thursday, July 2nd.

**LANCASHIRE AND CHESHIRE BRANCH: HYDE DIVISION.**—The annual meeting of the Hyde Division will be held at the Hyde Town Hall on Thursday, June 11th.

**METROPOLITAN COUNTIES BRANCH.**—The annual general meeting of the Metropolitan Counties Branch will be held at the British Medical Association House, Tavistock Square, W.C.1, on Tuesday, June 23rd, at 4 p.m. Business: (1) Report of scrutineer on election of officers; (2) Annual Report of Council; (3) Report of Representatives of the Branch on the Central Council; (4) President's address, by Mr. Comyns Berkeley.

**METROPOLITAN COUNTIES BRANCH: KENSINGTON DIVISION.**—The annual general meeting of the Kensington Division will be held at 21, Westbourne Terrace, W.2, by invitation of Mr. E. B. Turner, F.R.C.S., on Wednesday, May 27th, at 4.30 p.m. Agenda: Election of Divisional officers, members of Executive Committee, and Representatives on Branch Council, and nominations of officers for the Branch Council; instructions to Representatives in Representative Body.

**METROPOLITAN COUNTIES BRANCH: NORTH MIDDLESEX DIVISION.**—A meeting of the North Middlesex Division will be held on Thursday, May 28th, at the laboratories of Messrs. Parke, Davis and Co. at Hounslow. By the kindness of the directors, cars will be provided to take members to and from Hounslow, starting about 1.30 p.m. The party will leave about 6 o'clock, but, if necessary, arrangements will be made for any members desiring to return earlier.

**METROPOLITAN COUNTIES BRANCH: ST. PANCRAS DIVISION.**—A meeting of the members of the British Medical Association and other practitioners residing within the area of St. Pancras will be held at the Midland Hotel, St. Pancras, N.W., on Friday, June 5th, at 4.30 p.m. precisely, to consider the constitution of the Division. Agenda: (1) To elect a chairman will be proposed: "That this meeting approve of the St. Pancras Division of the British Medical Association." (2) The following officers will be elected: (a) Chairman of the Division; (b) Vice-Chairman of the Division; (c) Honorary Secretary and Treasurer; (d) Representative on Representative Body; (e) Representative on Branch Council; (f) Members of the Executive Committee. (4) Such other matters as may arise. (5) It will be further proposed: "That a copy of the resolutions passed at the meeting be sent to the Metropolitan Branch Council with a request to make them effective as early as possible."

**METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISION.**—The next meeting of the Westminster and Holborn Division will be held on Thursday, June 11th, at 8 p.m., at the Clinic, 86, Brook Street, W.1. A good attendance of members is hoped for.

**METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.**—The annual meeting of the Willesden Division will be held at the Willesden General Hospital, Harlesden Road, on Wednesday, May 27th, at 9 p.m. Agenda: Report for the year: election of officers, committees, Representative on Branch Council, and Dinner Committee. Members are invited to take part in a discussion on the out-patient department of the Willesden General Hospital.

**MIDLAND BRANCH: LINCOLN DIVISION.**—The annual meeting of the Lincoln Division will be held at the Lincoln General Dispensary, Silver Street, on Wednesday, May 27th, at 3 p.m. Agenda: Notice of motion to rescind resolution of January 17th, 1924, re salary of medical officer of health; election of officers; election of Representative in Representative Body; certification of mental defectives under Act of 1913.

**NORTH OF ENGLAND BRANCH: NEWCASTLE-UPON-TYNE DIVISION.**—A meeting of the Newcastle-upon-Tyne Division will be held at 7, Windsor Terrace, Newcastle-upon-Tyne, on Tuesday, May 26th, at 8.30 p.m. Agenda: Correspondence; consider recommendations of Executive Committee regarding (1) presentation by the Division of a flag to be hung in the Great Hall of the new British Medical Association buildings in London, (2) voluntary levy on members of the Division with a view to providing a small fund for extraordinary expenses which cannot be met out of Division funds; consider Annual Report of Council to be dealt with as follows: Finance and organization—Dr. J. Hudson; BRITISH MEDICAL JOURNAL and science

—Mr. R. J. Willm; medico-political, ethical, and non-panel—Dr. R. Dagger; national health insurance—Dr. S. Worthington; Parliamentary elections—Dr. G. R. Fortune; public health and Poor Law—Dr. H. Kerr; hospitals—Mr. F. C. Pybus; naval and military—Mr. Ingham Murray.

**NORTH OF ENGLAND BRANCH: SUNDERLAND DIVISION.**—Scientific meetings of the Sunderland Division will be held at the Mental Hospital, Ryhope, on Wednesday, May 27th, at 3.30 p.m., and at the Borough Sanatorium, Hylton Road, Sunderland, on Tuesday, June 23rd, at 3.30. All members of the Division are invited to be present.

**OXFORD AND READING BRANCH: OXFORD DIVISION.**—A meeting of the Oxford Division will be held at the Radcliffe Infirmary on Wednesday, May 27th, at 2.30 p.m. Clinical cases. Mr. A. P. Doids-Parker: Gall-bladder surgery. After tea the Regius Professor of Medicine will give a clinico on patients in the wards.

**SOUTHERN BRANCH.**—The fifty-second annual meeting of the Southern Branch will be held at Bree's Royal Hotel, Jersey, on Thursday, June 11th, at 2.45 p.m., when the President, Dr. Henry Devine, O.B.E., will take the chair. Agenda: Annual report of Branch Council; financial statement for 1924-25; election of officers; vote of thanks to the retiring President. At the conclusion of the above business, Dr. Henry Devine will vacate the chair in favour of Lieut.-Colonel P. M. Benthif, M.B.E., who will deliver an address entitled "Reminiscences." Members wishing berths on the boat and rooms at the hotel to be reserved should communicate with the honorary secretary, Dr. Lockhart Stephens, White House, Emsworth, Hants, not later than June 3rd.

**SURREY BRANCH.**—The annual meeting of the Surrey Branch will be held in the Guildhall, Guildford (by kind permission of the Mayor of Guildford), on Wednesday, June 24th, at 1.45 p.m. Agenda: To receive (a) report of the election of new officers, who shall thereupon take office; (b) report of the Branch Council and the annual financial statement. Address by the President, Mr. H. Branson Butler, F.R.C.S.E. The Guildford Division invites members to lunch at the Angel Hotel, Guildford, at 1 p.m. After the annual meeting members will proceed by car to Alton, where Sir Henry Gauvain has invited them to tea at his private clinic at 3.30. Sir Henry Gauvain will afterwards conduct the party over Lord Mayor Treloar Cripples' Hospital (by permission of the Governors). The annual Branch dinner will be held at the Angel Hotel, Guildford, at 7 p.m. (tickets 7s. 6d., exclusive of wine). It is hoped that as many members as possible will stay to the dinner.

**SURREY BRANCH: GUILDFORD DIVISION.**—The annual meeting of the Guildford Division will be held on Thursday, June 4th, at 4 p.m., at the Royal Surrey County Hospital, Guildford. Tea at 3.45. Agenda: Election of officers; receive (a) annual report of the Executive Committee, (b) report and accounts of the Division; consider fees for medical examination of Territorial recruits; consider Annual Report of Council, and instruct the Representative. Members are asked to bring with them the SUPPLEMENT to the BRITISH MEDICAL JOURNAL for April 11th and 18th, 1925.

**YORKSHIRE BRANCH: LEEDS DIVISION.**—A special meeting of the Leeds Division will be held in the Medical School, Thoresby Place, Leeds, on Friday, May 29th, at 8 p.m. Business: To meet the recently qualified medical men of the Leeds Medical School; address by Dr. Welch on the work of the British Medical Association; presentation of the British Medical Association prizes to Mr. Carter and to Mr. Masser. Morning dress. Light refreshments.

## Meetings of Branches and Divisions.

## NEW SOUTH WALES BRANCH.

## ANNUAL REPORT.

The annual report of the council of the New South Wales Branch shows that there has been a net increase in membership of 100 during the last twelve months, the members now numbering 1,423.

Ten ordinary meetings of the Branch, including the annual meeting, four extraordinary meetings, and five clinical meetings, were held, the average attendance being 61. The business of meetings during the year included thirty-eight papers and addresses, and numerous reports of cases and exhibits, with lantern demonstrations. The sum of £100 was contributed to provide the President's chair for the Great Hall of the new House of the British Medical Association in London. Steps are being taken to amend the articles of association of the Branch so as to make them conform with the model articles of an incorporated Branch approved by the Central Council. Negotiations were reopened by the Friendly Societies' Association for reduced rates of attendance on females and children, and for the prescribed rate for attendance to be a fixed rate instead of a minimum rate. After careful consideration and discussion a reply was given to the effect that no reduction of the rates for attendance on females could be made. The Friendly Societies' Association was invited to submit proposals for a scheme for contract attendances for members of juvenile lodges; the rates for attendances prescribed in the agreement should be minimum rates. Correspondence is in progress with the Friendly Societies' Association with regard to the provision of uniform medical certificates in connexion with sickness benefit, proposal forms for membership, applicants' declaration forms, and medical certificates of health. The establishment of a complete plant and equipment for the publication of the *Medical Journal of Australia* has now been completed; the first issue printed on the new machines was that of March 1st, 1925, and

carried on its front page a reproduction of the figure of Aesculapius taken from the gold medal of the British Medical Association in Australia. In April, 1924, Dr. W. J. Mayo, of the Rochester Institute, United States of America, accompanied by other distinguished representatives of the American Medical Association and of the American College of Surgeons, visited Sydney, and were entertained by the Branch. Professor Grafton Elliot Smith revisited the University of Sydney in September, 1924. The post-graduate course in medicine, designed by the council and approved by the Faculty of Medicine, was held at the University in September, 1924.

#### War Memorial Carillon.

The Branch combined with the Sydney Faculty of Medicine to provide one bell, at a cost of £1,070, in the carillon which is being installed in memory of the members of the University of Sydney who fell in the war. It was suggested that, besides the memorial inscription on the bell, the name "Asklepios" in Greek lettering should be added, so that it should become known as the "medical bell."

#### DORSET AND WEST HANTS BRANCH: BOURNEMOUTH DIVISION.

The annual meeting of the Bournemouth Division was held on May 6th in St. Peter's Snail Hall, Bournemouth. The Representative to the Panel Conference on the Memorandum of Evidence placed before the Royal Commission on National Health Insurance gave a brief outline of the chief resolutions.

The following officers were elected:

Chairman, Dr. E. W. D. Hardy. Vice-Chairman, Dr. A. D. Edwards. Honorary Secretary and Treasurer, Dr. O. C. Carter. Representative in Representative Body, Dr. Morse and Dr. Johnson Smyth. Deputy Representatives, Dr. Mahomed and Dr. Hutton.

A vote of thanks was accorded Dr. Morse for all the work he had done during his year of office and for having invited the members to tea before the meeting.

#### GLASGOW AND WEST OF SCOTLAND BRANCH: GLASGOW EASTERN DIVISION.

The annual meeting of the Glasgow Eastern Division was held on May 6th, when Dr. J. WALLACE ANDERSON was in the chair. The HONORARY SECRETARY gave a review of the annual report of the Division, which was approved.

The following office-bearers were elected:

Chairman, Dr. John P. Granger. Vice-Chairman, Dr. T. M. Fletcher. Honorary Secretary and Treasurer, Dr. David McKail. Representative in Representative Body, Dr. William Adam Burns. Deputy Representatives, Dr. David McKail and Dr. James Craig.

The Annual Report of the Council was considered. Para. 67, referring to grouping for 1926-27, was approved, and two motions regarding factory service were adopted for the Annual Representative Meeting (see BRITISH MEDICAL JOURNAL SUPPLEMENT, May 16th, p. 204).

The HONORARY SECRETARY reported that six members had entered for the Divisional stage of the competition for the Treasurer's Cup, and that the winner was Dr. G. Stewart Reid (handicap 6).

On the motion of Dr. GRANGER a hearty vote of thanks was accorded to Dr. J. Wallace Anderson, the retiring chairman, for his valuable services to the Division during the past year.

#### LANCASHIRE AND CHESHIRE BRANCH: ROCHEDALE DIVISION.

The annual meeting of the Rochdale Division was held in the Wellington Hotel, Rochdale, on April 29th, when Dr. BATEMAN was in the chair. The annual report stated that the membership had increased during the year from 45 to 50, and the financial statement showed a balance in hand of £2 15s. 8d.

The following officers were elected:

Chairman, Dr. Bateman (Rochdale). Vice-Chairman, Dr. Lomas (Castleton). Secretary and Treasurer, Dr. J. Melvin (Bamford). Auditor, Dr. Harris (Rochdale). Representative in Representative Body and Branch Council, Dr. J. Melvin (Bamford). Deputy Representative in Representative Body, Dr. Jefferson (Rochdale).

#### METROPOLITAN COUNTIES BRANCH: MARYLEBONE DIVISION.

The annual general meeting of the Marylebone Division was held on May 8th, when Mr. C. EDWARD WALLIS was in the chair. Arising out of the report of the Central Council, an amendment relating to death certification and registration was adopted for incorporation in the agenda of the Annual Representative Meeting.

The following officers were elected:

Chairman, Lord Dawson of Penn. Vice-Chairman, Dr. D. S. Roxburgh. Treasurer, Dr. Charles Goulet. Honorary Secretary, Dr. Percy Spurgin. Representatives in Representative Body, Drs. Eleanor Lowry, C. O. C. E. Wallis, Deputy Representatives in Representative Body, Dr. F. W. E. Goodbody, Messrs. W. McAdam Eccles, Bishop Harman, H. S. Souttar, and E. E. Ware.

#### METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

A MEETING of the Willesden Division was held on April 22nd at the Willesden General Hospital, when Dr. W. WOODLEY STOCKER was in the chair.

Drs. Scott and Skene were respectively appointed Representative and Deputy Representative in the Representative Body for the year 1925-26. A report of the proceedings of the meeting of the Executive Subcommittee, held on April 18th, was presented by Dr. Scott (chairman) and approved.

The honorary secretary (Dr. PATERSON), drew attention to the fact that the period of office of the Local Medical Advisory Committee would soon terminate, and to the necessity for action

being taken if the committee was to be continued. It was decided to call a meeting of the local profession to elect a Medical Advisory Committee on May 21st, prior to the clinical meeting fixed for that date, to be held at the Willesden General Hospital.

The Annual Report of Council was considered. The CHAIRMAN explained the paragraphs relating to the new house of the Association in Tavistock Square, which was to be opened shortly. Dr. LOCK dealt with the proposals of the Council in connexion with the setting up by the Association of locumtenents' bureaux in teaching centres, which were approved.

Dr. BUCHAN reported upon the suggestions of the Council regarding individual medical defence, which were approved. After explanation by Dr. SKENE of the paragraphs of the report dealing with medical ethics and the matter of indirect methods of advertising, the proposals of the Council were approved. Dr. STURRIDGE having explained the action taken by the Council regarding Coroners' Law and Death Certification, and its proposals thereon, the paragraphs of the report dealing therewith were approved, subject to the fees of 7s. 6d. and 2s. 6d. respectively being substituted for the fees of 5s. and 2s. appearing in paragraph 7 of Appendix III to the report. An amendment to this effect was directed to be forwarded for inclusion in the agenda of the Annual Representative Meeting at Bath.

Paragraphs 120 of the report, regarding fees for medical examination of emigrants, having been explained by Dr. SKENE, the Council's proposals were approved. Dr. BUCHAN explained paragraphs 103-109 of the report, dealing with the question of the composition of the General Medical Council. The suggestions of the Council regarding factory medical service were explained by Dr. BUCHAN and the scale of salaries for public health appointments by Dr. SKENE.

On the motion of Dr. Skene it was resolved:

That the Representatives of the Division be instructed to call attention to the necessity for all possible steps being taken by the Association to have removed the disqualification at present resting upon any individual who becomes an inmate of a Poor Law hospital for the purpose of receiving medical or surgical treatment, even though such individual repays the whole cost thereof.

#### MIDLAND BRANCH: DERBYSHIRE DIVISION.

At a meeting of the Derbyshire Division held on May 8th, the following motion, proposed by Dr. HERRICKAN, seconded by Dr. WATT, was carried:

That the resolution passed at the Representative Meeting at Bradford last year, that it is not advisable that whole-time medical officers engaged in public health work should accept fees for consultations, be rescinded.

Dr. HERRICKAN (Buxton) was elected Representative in the Representative Body. The Annual Report of Council was considered and the various recommendations were approved.

#### PERTH BRANCH.

A MEETING of the Perth Branch was held on May 8th. Dr. HAIG was appointed Representative in the Representative Body, and Dr. Taylor (Riversdale) Deputy Representative. It was resolved to send Dr. Menzies, the President, and Dr. Hume, Secretary, as delegates to the opening of the Association's new Scottish house in Edinburgh on June 4th. The Annual Report of Council was considered and general satisfaction was expressed at the concise and clear way matters were handled in the report.

#### SOUTH WALES AND MONMOUTHSHIRE BRANCH: NORTH GLAMORGAN AND BRECKNOCK DIVISION.

A WELL attended meeting of the North Glamorgan and Brecknock Division was held at the New Inn, Pontypridd, on May 7th.

Mr. JOSEPH E. ADAMS, M.S., F.R.C.S., senior surgeon to the East London Hospital for Children and surgeon to St. Thomas's Hospital, delivered a British Medical Association Lecture on acute abdominal crises in children. He dealt with the subject in a very interesting manner, contrasting the conditions that might possibly lead to confusion of diagnosis, and laying emphasis on what he called possibilities and probabilities. The lecturer considered his subject was a timely one for general practitioners, and for a correct conclusion it needed the combination of the mind of both the physician and surgeon.

At the close of a very instructive lecture a hearty vote of thanks was, on the proposition of Dr. J. O. D. WADE, seconded by Dr. HOWARD DAVIES, accorded to Mr. Adams, who suitably responded and thanked the Division for inviting him.

A dinner was held in the evening, at which Mr. Adams was the guest. The usual toasts were honoured, including that of prosperity to the British Medical Association, and this concluded a very pleasant evening.

#### UGANDA BRANCH.

THE annual general meeting of the Uganda Branch was held at Mulago on March 13th, when Dr. ALBERT COOK was in the chair.

The balance sheet, drawn up and audited by Messrs. Spencer and King, Kampala, was presented and approved.

The following office-bearers were elected for 1925:

President, Dr. Webb. President-Elect, Dr. Owen. Vice-President, Dr. Lee. Secretary and Treasurer, Dr. Mitchell.

Dr. VAN SOMEREN was appointed delegate to the Annual Meeting of the Association at Bath and to the opening of the new headquarters in Tavistock Square. A paper on the treatment of bacillary dysentery by the administration of frequent small doses of castor oil, combined with the giving of full diet, was read by Dr. A. J. BOASE, and was followed by a discussion.

## National Insurance.

## THE ROYAL COMMISSION.

The twenty-eighth meeting of the Royal Commission on National Health Insurance was held at the Home Office, Whitehall, on May 14th, Lord Lawrence of Kingsgate in the chair.

Evidence was given on behalf of the National Medical Union by Dr. Vivian Greenyer, chairman of the council of the union, and Dr. Charles Thornton Comber, member of the council; and on behalf of the Scottish Medical Guild by Professor William Russell, president of the guild, and Dr. Frederick Porter, secretary. These witnesses submitted various criticisms of the health insurance scheme on its medical side, and urged a reversion to private arrangements, except for necessitous persons, for whom a State medical service should be provided. Thereafter Dr. Harry Roberts gave evidence as to the working of the Act in a large panel practice in Stepney, and Lieut.-Colonel Bickerton-Edwards submitted a number of suggestions for organizing medical treatment and improving the conditions of the insurance practitioner.

## Correspondence.

*The Liberties of the Profession.*

SIR.—Having made it clear that the opinions with which Dr. Picton credited me in one form or another have never, in fact, been held or uttered by me, I have no wish to enter into any controversy. In his second letter, however, he reiterates one point, and it may be presumed, therefore, that he considers it important. As he is under a misapprehension on this point it seems desirable that he should be corrected.

Dr. Picton challenges—indeed, he directly contradicts—my statement that the Insurance Acts Committee has always taken a view contrary to that held by Cheshire—that there should be a right of appeal to the courts of law from the decisions of the Minister of Health in all cases in which he exercises disciplinary powers in connexion with the Insurance Acts. This statement was true at the time it was made and is true to-day. Dr. Picton will observe that it was made with reference to the Insurance Acts Committee, not with reference to the Conference of Panel Committees. It is true that on the occasion to which he refers, the Conference did by a majority, towards the end of a prolonged sitting, pass a resolution which supported the Cheshire position, though it was confined to one class of disciplinary case only. The Insurance Acts Committee, as the executive committee of the Conference, loyally did its best to carry out the wishes of the Conference, and reported its action the following year. The opinion of the Committee itself had not changed, and, in making its report, it took some pains to indicate this.

The result of the action taken by the Committee in this instance is instructive. A bill amending the National Health Insurance Acts was before the House of Commons. An absolutely honest and strenuous attempt was made to get some member to put down an amendment in the sense desired by the Conference resolution. One and all refused to have anything to do with it. Each expressed his individual disapproval, and told us that it would be quite impossible to ask the House of Commons to take such action.—I am, etc.,

London, N.4, May 17th.

H. B. BRACKENBURY.

*The Rural Practitioner and Midwifery Work.*

SIR.—It seems to me a very extraordinary thing that in paragraph 29 of the Memorandum of Evidence tendered to the Royal Commission the existence of the rural practitioner appears to be ignored. His position is quite different from that of the urban practitioner. He cannot decline to undertake maternity work, so it is imperative—primarily in the interests of the community—that he should be encouraged to attend as many confinements as possible.

At the present moment insidious attempts are being made by many health authorities to try and restrict the attendance of doctors to so-called abnormal cases of labour. A midwife (or skilled nurse) and a doctor should be provided for in all confinements, and this is what the Association ought to fight for, especially in rural areas.—I am, etc.,

Woodbridge, Suffolk, May 17th.

T. CUMING ASKIN.

*Nursing Homes (Registration) Bill.*

SIR,—May I support Dr. E. R. Fothergill's letter in the SUPPLEMENT of May 2nd (p. 194), with special reference to the sentence, "It is also another instance of proposed legislation by regulations?"

Presumably the regulations may be on similar lines to those at present in force in the case of maternity homes, which are

compulsorily registered in the county of Middlesex, and probably elsewhere, under the name of "lying-in homes"; though in this case a doctor who keeps on may be exempted from registration if he obtains from two other doctors certificates which the county council considers satisfactory of his own fitness and that of his premises and staff.

Besides the details (a) to (e) enumerated by Dr. Fothergill, the register for lying-in homes must contain amounts of fees paid; receipts have to be given in a prescribed form, with counterfoil containing details of the fees paid and whether the fees include any payment for a doctor's services; both receipt and counterfoil must bear the name and address of the keeper of the home. The question of fees for medical attention is usually a confidential one between doctor and patient, but in this case the counterfoils are open to inspection by the medical officer of health or the county council's inspector. Penalties are prescribed for failure to comply with all the requirements of keeping records, etc., or to display the by-laws.—I am, etc.,

May 3rd.

M.R.C.S.

## Naval and Military Appointments.

## ROYAL NAVAL MEDICAL SERVICE.

SURGEON COMMANDERS A. S. PATTERSON to the *Carlisle*; M. C. Mason and A. H. Joy to the *President*, additional for three months' post-graduate course; H. H. Babington to the *Vivid*, additional for R.N. Barracks, Devonport, as specialist in ophthalmology; A. A. Sanders, O.B.E., to the *Flora*, additional, and for R.N. Hospital, Cape.  
Surgeon Lieutenant G. S. Rutherford to the *Victory*, additional for Portsmouth Dockyard.

## ROYAL ARMY MEDICAL CORPS.

Major-General W. H. S. Nickerson, V.O., C.B., C.M.G., late R.A.M.C., is appointed Honorary Surgeon to the King, vice Major-General T. W. Gibbard, O.B., C.B.E., late R.A.M.C., retired.

Captain J. H. O. Walker is granted the temporary rank of Major whilst employed as a Deputy Assistant Director of Pathology.

Captain J. J. Molyneux, half-pay list, late R.A.M.C., retires on account of ill health.

Lieutenant (on probation) T. A. J. M. Dodd is seconded under the provisions of Article 197, Royal Warrant for Pay and Promotion, 1922.

## ROYAL AIR FORCE MEDICAL SERVICE.

Flight Lieutenant (honorary Squadron Leader) W. R. Kemp relinquishes his temporary commission on ceasing to be employed, and is permitted to retain the rank of Flight Lieutenant.

## INDIAN MEDICAL SERVICE.

Lieut.-Colonel R. W. Anthony appointed to officiate as Inspector-General of Civil Hospitals, Central Provinces, from March 30th.

Lieut.-Colonel H. Boulton, C.B.E., to be Colonel, vice Colonel F. Wall, C.M.G., K.H.S., retired.

Captain J. C. De to be Major.

Lieutenant W. H. Critten to be Captain.

## VACANCIES.

## Royal Commission on National Health Insurance.

### EVIDENCE GIVEN BY REPRESENTATIVES OF THE BRITISH MEDICAL ASSOCIATION.

At the twenty-seventh meeting of the Royal Commission on National Health Insurance, held at the Home Office on May 7th, evidence on behalf of the British Medical Association was continued by Dr. R. A. Bolam, Chairman of the Council; Dr. H. B. Brackenbury, Chairman of the Representative Body; Dr. H. Guy Dain, Chairman of the Insurance Acts Committee; Dr. Alfred Cox, Medical Secretary; and Mr. N. Bishop Harman, Honorary Treasurer.

The Commissioners present were Lord Lawrence of Kingsgate (in the chair), the Right Hon. Sir John Anderson, G.C.B., Sir Humphry Rolleston, Bt., K.C.B., M.D., P.R.C.P., Sir Andrew Duncan, Mr. James Cook, J.P., Mr. John Evans, Professor Alexander Gray, Mr. William Jones, Mrs. Harrison Bell, and Miss Gertrude Tuckwell.

The following subjects were dealt with: The procedure for dealing with complaints against doctors, the work of medical institutions under Section 24 (4) of the Act, the need for a unified local health service and the administrative and financial arrangements in connexion therewith, and the arrangements for the additional treatment benefits. Dr. Stanley Hodgson, Chairman of the Salford Panel Committee, gave evidence on the Manchester and Salford method of payment of doctors on an attendance basis. Dr. J. P. Williams-Freeman, Chairman of the Hampshire Panel Committee, gave evidence on the peculiar conditions of rural areas.

We publish below the full text of the oral evidence given by the British Medical Association's witnesses on May 7th. The evidence given on April 30th appeared in the SUPPLEMENT of May 23rd (pp. 209-227).

### MINUTES OF EVIDENCE, MAY 7TH, 1925.\*

[Dr. R. A. BOLAM, Dr. H. B. BRACKENBURY, Dr. H. GUY DAIN, and Dr. ALFRED COX, recalled and further examined.]  
*Chairman:* We have reached Part II, Section C.—*Dr. Bolam:* My lord, may I refer to three matters which were rather left in abeyance at the last sitting of the Commission? First, Mr. Jones asked some questions in regard to the midwifery service in Glasgow, and on that we thought it proper to endeavour to elicit some information from the area, and Dr. Drever, our Scottish Secretary, is here. It appears that, whatever steps were taken to get a list of professional men who were prepared to do work of this kind, this was not done through any organized body of medical men, and I think we could be sure now that if approach was made to the organization of the profession in that area they would see that service was implemented if any engagement were come to. If Mr. Jones has any further question to ask with regard to that, our Scottish Secretary is here.  
*Mr. Jones:* I do not know that I have any further question to ask. Dr. Cox gave me the assurance last week that they would investigate the matter. The trouble was quite a serious one at the time it arose, and even after I got that list, which you perhaps know of, and circulated it, trouble arose again, but I have had no recent complaint in regard to the midwifery service.—*Dr. Brackenbury:* There is one point in connexion with it which bears upon the system we advocate in our Statement. It is this. In those cases it becomes, perhaps not unnaturally, the custom of certain midwives to favour, shall I say for the moment, certain doctors: that when they have to call in doctors a certain midwife calls in a Dr. A almost invariably; he is for the moment not available, and she sends for Dr. B, who knows that she is in the habit of sending for Dr. A, and does not wish particularly to be made a convenience of, and he says "No; if you are always sending for Dr. A it is his job," and difficulties arise in that way. So that

if our proposal were adopted of having the particular doctor chosen by the woman associated with the case beforehand, not only would it be better on the grounds we advocate, but it would probably help to obviate some of the difficulties which arise in circumstances such as I have mentioned.

*I am perfectly familiar with that phase of the matter, and I have dealt with it as far as it is possible to deal with it through the Public Health Authority, but I do not think that is the whole explanation.—No.*

As a matter of fact one of the main reasons is that in that particular district very few of the doctors reside in that area, but reside at considerable distances from the area.

*Chairman:* Is there any other point?—*Dr. Bolam:* The next point, my lord, was one raised by Professor Gray with regard to ophthalmic benefit, and we have here to-day Mr. Bishop Harman, the Treasurer of the Association, who is in practice as an ophthalmologist, and he would be prepared to deal with that part of the matter now.

*Chairman:* Very well.

[Mr. N. BISHOP HARMAN, called and examined.]

*Professor Gray:* Mr. Bishop Harman, I merely want to elicit a statement from you with regard to your attitude on the question of medical diagnosis before a person is entitled to obtain ophthalmic treatment. You regard it as essential, I understand, that before a person gets treatment for the eyes he should be seen by a qualified medical man. Is that not so?—*Mr. Bishop Harman:* Yes. It is necessary that you should have some check on the giving away of an inestimable privilege. It must not be

\* Reproduced by permission of the Controller of H.M. Stationery Office.

scattered broadcast, otherwise your expenses will be mounting up and make it prohibitive.

Is it primarily a financial reason, or is it a medical reason?—Both. It is financial, but there is a second reason—you cannot overload your specialists with work which is unnecessary: you must reserve their services for essential necessities.

Is there not also a third point? There is, first of all, the point you have mentioned of cost, which I suggest to you is primarily a matter for the Approved Societies; they have the money for this purpose at present, and the suggestion there is that if you open the doors too wide you might have too many people getting over the specialist; but apart from that, is there not a third point, that without some sort of proper medical treatment the insured person might get into the hands of unqualified people?—That is inevitable. There is that risk. You want your additional benefit to be of real value in the general service; it is not to be a separate thing, something that is detached from the whole work of treatment of the patient; but whatever is done by the specialist should be reported to the practitioner in charge, so that it becomes part of the stock valuable information with regard to that patient. When a man is referred to an ophthalmic surgeon for examination the practitioner gets back a report on his condition. But not only on his eyes. Because the eyes are part of the body, and because he sees certain things in the eyes, the specialist tells the doctor to anticipate certain things with regard to his body. That is the real fundamental value over and above the treatment of symptoms that arise from defective vision.

How far do you consider the ordinary practitioner is capable of undertaking eye treatment?—A certain number of them do eye treatment and do it very well indeed: their bent is in that direction; if they could give the time and could afford the risk they probably would devote themselves to ophthalmic work, but they cannot, and they combine it with general practice. I must say I am filled with amazement at the excellence of the work done by some men who are in general practice but who do a certain amount of ophthalmic work.

Would you elaborate for us the position that would arise if you cut off ophthalmic benefit entirely from the qualified medical practitioner? I suppose you might say that there are people who are skilled in fitting spectacles, who would have a certain amount of knowledge with regard to the eyes, and who can by tests prescribe more or less the right kind of spectacles. What do you say to that?—I should say it was penny wise and pound foolish. You get a cheap article and pay for it at a rate which makes it relatively valueless. At the most you would get spectacles which may or may not be suitable. Assume they are suitable, you get nothing beyond that. There is no information from an experienced person as to the state of the patient's body from his examination of the eyes. I do not know whether it is realized that the eyes are the one place where you can look into a man's body and see his nerves and blood vessels and tissues just as though you put your head through the window and looked at this Royal Commission and judged of its members by the appearance it presented. That is the only place where you can do it. The surgeon passes tubes down the throat and into the stomach, but all his views are obscured by the surroundings and are under all great difficulty; but in the eye you look inside, I will not say to see the soul, but it is next door to it. Unless a man has spent his life doing that and is trained as a doctor what value can you get out of his service?—and that is the most valuable thing, far and away the most valuable. You see the initial symptoms of diabetes, Bright's disease, all sorts of conditions that warn you how to treat the man. There are more diagnoses of serious conditions made by the ophthalmic examiner than perhaps by any other specialist.

It has been suggested to us in evidence that in a considerable proportion of cases the optician, even though unqualified in your sense, would nevertheless give the right spectacles, and that only in a very small percentage of cases was the intervention of the qualified medical man required. In what percentage of cases would you say that the optician was competent to give spectacles which would not, to put it no higher, do the patient any harm?—If I were to answer that as an optician, to judge by the literature that they are now publishing, the majority of prescriptions that are issued by, as they call it, the unqualified optician would be wrong. The greatest criticism of this unqualified spectacle-supplying comes from the rest of the opticians. A few of them who are more capable than the rest denounce the bulk of them and say it is essential that the State should step in to protect the general public from the ravages of the optician. That is the statement that you will find month after month in their publications. What percentage of the prescriptions or spectacles supplied by that select minority, who give themselves lengthy titles, are correct I would not venture to suggest.

Dr. Balam: My lord, may I say one thing on the general aspect? Within the last month I have had examples of three conditions which are extremely important in showing that the reason is not so much that the spectacles supplied may not be quite the right lens but the risk is that some important disease shall be overlooked. I have had three instances come to my own knowledge within the last month where spectacles have been supplied by opticians in good faith, the patient going in good faith to the optician. A visit to an ophthalmic surgeon in one case led the surgeon to infer from the eye condition that the patient was suffering from diabetes, and this was found to be the case; in a second, the patient was found to be suffering from Bright's disease; and in the third the condition was found to be due to syphilitic disease of the eye. That is just within one man's experience.

Sir Humphry Rolleston: Mr. Bishop Harman, I understand that you object to the straight step from the patient to the ophthalmologist; you say there must be an intermediate step. Is it not

possible that in some cases this might be thought to act adversely to the interests of the patient, that the medical man might overlook something like eye-strain, for instance, and the patient himself might conceivably in certain circumstances have the impression that he would like to have his eyes examined, but the practitioner might in perfect good faith not see the necessity? Is there any way in which you can get over that?—Mr. Bishop Harman: That is mentioned to some extent in the Statement of Evidence, but I would like to point out that there may be differences of opinion between the private practitioner and the patient as to the cause of the symptoms. The patient may have been told by a friend, "I had my eyes treated and my headache disappeared," and he goes to the private practitioner and the private practitioner says, "Your headache has nothing to do with your eyes, it is due to this first and most obvious thing," pointing to some symptom. It is therefore reasonable that the private practitioner should have the determining voice certainly in the first instance. There might be, and should be, some mechanism for meeting the conditions where the patient and the practitioner do not agree.

What mechanism would you suggest?—There is the Regional Medical Officer for one.

That would work all right, you think?—I think so. It works to-day, the same sort of arrangement. I see quite a number of cases for Regional Medical Officers; they have been reported by private practitioners as unfit to work and the Regional Medical Officer has had doubts and he has fetched me in to give him an opinion with regard to the eye condition, and he bases his judgment upon that. He is the arbiter between the two.

That only works if the practitioner desires the opinion, not if the patient desires it?—Both ways. In one instance it is asked, Why should you differentiate between dental treatment and ophthalmic treatment? I look upon dental treatment as so necessary that I think it ought to be part of the routine that every year the insured patient should go to have his teeth examined; we should not wait till he has got pyorrhoia, or something like that. The preventive treatment of mouth conditions would pay better than anything else you could do. That is not the case with regard to ophthalmic work. It is not necessary. The conditions and symptoms are fairly definite and recognizable and they may be reasonably left to their occurrence, but with regard to mouth conditions it is quite otherwise. Patients come to the hospital with foul mouths that have been like that for years, and they do not know, and they suffer from conditions which are scarcely curable because of the long-continued state of disease of the mouth. That is the reason for the difference.

Chairman: Thank you. (The witness withdrew.)

Dr. Balam: In paragraph 22 there is a provision made in respect of that under the consultant service that some official referee might decide matters.

Chairman: Is there any other point?—The only other outstanding matter is the question of the service in Manchester and Salford, which differs in some respects from that of the rest of the country. At your request we have brought Dr. Stanley Hodgson from Salford. He would be prepared to offer any information to the Commission. Dr. Stanley Hodgson is the Chairman of the Panel Committee of Salford and member of the Insurance Committee of Salford from the beginning. This scheme originated in Salford. Manchester took it from Salford.

[Dr. Stanley Hodgson, called and examined.]

Professor Gray: I understand, Dr. Hodgson, that in Manchester and Salford the system of payment of insurance practitioners rests on an attendance basis?—Dr. Hodgson: Yes.

That is to say, there is a scale drawn up under which so much is paid for attendance, so much for a visit, so much for an operation, and so on?—Yes.

Could you tell us what that scale is?—At the present moment it is a purely arbitrary scale because the actual amount set out in that scale is not in fact paid.

Quite so. The amounts assigned are in fact merely tokens?—Tokens.

And are liable to be scaled up or down as the case may be?—Down, invariably.

What happens in the other case; would they be scaled up?—It is not for them to be scaled up.

The money is never sufficient. Theoretically it is possible. I believe actually it is possible in the Isle of Man, where they have adopted the system and they have found that they can scale up.

If it is an extremely healthy area, as you always have in the Isle of Man, you scale up all the time?—I suppose so. It has not happened in Salford.

Under the attendance system there is no more money going into the area?—No.

So that in the end the doctors in the area get precisely the same amount of money as they would get on an capitation basis?—No; since payment is based on attendance that is not the case. On the capitation basis a doctor whose patients are in a healthy area and require less attendance might get exactly the same amount of money as a doctor in a congested area where his patients are always being ill would get.

I am not referring to any particular doctor, but to doctors as a body. The same amount goes to the medical profession?—Exactly, yes.

With regard to the scale, can you give the Commission some information with regard to the relative importance of the various services?—The most important services are the ordinary surgery attendance and the ordinary domiciliary visit.

What token do you assign to that?—Up to last year in Salford the token was 3s. for a surgery attendance and 3s. 6d. for a visit; it has been reduced to 2s. and 2s. 6d.

What other things do you allow for?—Shall I read the scale?

*Chairman:* Could you hand it in?—Unfortunately these papers are not in duplicate. That is the Manchester scale. (Document handed in.) There is very little difference from our own scale.

*Professor Gray:* Attendance on the patient at the surgery 3s.; visit to patient's residence 4s.; special visit 5s.; night visit 10s.; operation 10s. 6d.; cases of abortion or miscarriage, no special fee. What does that mean?—The ordinary attendance rates.

Varying from doctor to doctor?—No; he simply puts that down as an ordinary visit.

Anaesthetist, 2 guineas; setting fracture or reduction of dislocation, 2 guineas. So that the anaesthetist in these circumstances gets four times as much as the doctor who performs the operation?—Yes.

What is the reason for that? Is not the man who does the operation of more importance than the man who administers the chloroform?—In the ordinary case an anaesthetic would be given for a case outside the range of medical benefit. That is what we felt.

Then these are not comparable?—No. The half-guinea operation is usually quite a small operation and of course within the range of medical benefit.

Why should the anaesthetist in the case of a thing outside medical benefit come in here at all?—We have always held that the services of an anaesthetist should be adequately paid because it is a service where special skill is required.

That is not the point. The point is why should you in the case of general service pay for the anaesthetist where the operation is outside the scope of medical benefit?—That has to be done under the regulations.

Can you tell us how in fact this scaling down is done?—In Salford the practitioners enter all their attendances on day sheets—that is to say, the name and address of the patient, the Approved Society, and so on, and the actual attendances. At the end of three months these day sheets are detached and sent in to the Panel Committee, where they are scrutinized. We found on the very first scrutiny that it was impossible to pay the practitioners in full. Obviously certain practitioners had not as much skill as others; they kept their patients on longer, not with any intent, but they were actually kept on longer. Later, perhaps, they kept them on with intent, but that does not matter. I should explain that I am speaking now entirely for my own town; this is a parochial matter; I am not speaking for the British Medical Association, I am speaking purely as a local representative.

*Chairman:* Quite so. Then when we went into the accounts we found that a large number of good-class practitioners, the best practitioners, kept their attendances within certain limits, so we took the average amount of attendance required per person, and those practitioners who exceeded that average had their attendances reduced to that average, but those who were below the average did not have their attendances raised to that average. Is that clear?

*Professor Gray:* Yes, there are two points. Firstly, on the face of it on the attendance basis there is an encouragement to a doctor who is relatively idle to put in as many attendances as possible?—On the face of it it seems so, but you have two factors: you have the patient, and that is an important factor. On the face of it it works out that the more attendances you put in the bigger your payment?—If we had not adopted safeguards.

So you have had to adjust. There are actually two kinds of scaling down, are there not? First of all the fund cannot pay 100 per cent.?—Quite.

So you have to scale down in order that the fund may pay whatever is possible?—Yes.

Over and above that there is a further scaling down as against a doctor who has put in too many attendances?—Yes.

So that you have a double scaling down?—And the latter scaling down takes place first, of course.

Can you tell us how it is possible to do this scaling down after the event is all over? How can you come along after an illness is over and do anything else but accept what the doctor says? If a doctor tells you, "This was a very bad case, the man had pneumonia and I had to go three times a day," how can you say it was not such a case?—You cannot; but if that doctor has any number of patients there must be a large number of patients whom he sees only once, and what he loses on the roundabouts he makes up on the swings.

So that in effect you average it so as to get a kind of average payment?—Average payment, yes.

How far does that bring you back more or less to the capitation basis?—You mean in what way is it different?

Yes. You pay the doctor what, after all, turns out to be the average payment in respect of each insured person?—You only pay the doctor actually, to begin with, for the work he has done. You do not pay him for his responsibility. In a capitation area the doctor accepts responsibility for a certain number of patients.

With all respect, you do not pay him for work done if you scale him down to the average?—On the contrary, we find, taking the good average practitioner, we can pay him for the work done. As the pool is limited we do not think it fair that the good average general practitioner should be fined—once again I am speaking parochially—for the possible incompetence of his confreres. We encourage the less competent man to acquire competence.

What are the advantages you claim for this? Is it, firstly, freedom of choice?—Originally that was very important, freedom of choice.

That is no longer an argument?—Not so much, no; though we are fiercer than a panel area.

Do you attach importance to the point that the insured person under the attendance system, through kindness of heart to the doctor, feels he can go as often as he likes and every time he

goes there is another 2s. 6d. or 3s.?—Not from that point of view. I should not attribute that mental attitude to the insured person, because I find even now that the insured person does not grasp the Insurance Act or the ramifications of medical benefit.

As a matter of fact the insured person in Manchester and Salford does not understand under your system how the doctors are paid?—He is just beginning. He realizes that he is more on a footing with the private patient. He is beginning to understand now that each attendance he makes is equivalent to an attendance made by a private patient.

He has got the length of understanding that it is on an attendance basis; he has not got the length of understanding that it is scaled down?—He does not know that, no.

Can you tell us whether this system has any reaction on the drug expenditure?—No. It is thrown at us that we are very high, but we always retort that Oldham, which has a singularly efficient medical service on the capitation basis, is still higher.

As a result of your scaling down you will be able to say whether or not you have more attendances per insured person than they have elsewhere?—There again the fallacy comes in that in Manchester and Salford it is absolutely essential that the practitioner should keep accurate records. He does not in fact omit a single record if he can possibly help it. Elsewhere it is quite possible for a man to omit a record. There again I am speaking parochially. That is what we maintain, and I think it is reasonable. I confess, as a holder of appointments on the capitation system, that I do not as a matter of fact enter all such attendances.

Do you think Manchester and Salford records are well kept?—They are.

Because every item goes to the making up of the bill at the end of the year?—We have practically perfect records, or as near perfect as they can be. *Dr. Brackenbury:* This, of course, refers to records of items of attendance only, not to clinical records. *Dr. Hodgson:* That is so.

Is there anything in the suggestion we have heard that under the Manchester and Salford system, inasmuch as every attendance is paid for, the doctor, in order to increase the number of his attendances, is prepared to go somewhat beyond the scope of medical benefit and give attendance which elsewhere a doctor would say was outside the scope?—No, I think not.

You think there is nothing in that?—Nothing at all.

So in fact you would repudiate the suggestion that in Manchester there is a bigger and better and wider medical benefit because of that reason?—No, I think an extraordinary good service.

*Mr. Jones:* Have any tests been made as to whether, after all your adjustments have been made, a certain number of persons on a panel or less than the capitation fee would be able to attend a person on a panel after the reduction has been made is worth possibly 1s. 9d., whereas others are perhaps chronic patients whom he attends regularly every week perhaps, and their attendance will come up considerably above the capitation fee, but it is a question of average.

You have no means of saying because you have no lists?—We have a record of every patient. I could supply you with every attendance of every patient.

But you have no list equivalent to the capitation list that the doctor has?—No.

So you cannot make a comparison as to whether a man on the panel with 500 patients would be remunerated properly under your system?—Yes. We know that 53 per cent. of our insured population in Salford receive medical attention. We have those figures. You can only take it on a broad basis. You cannot take individual cases. In the case of a doctor with a panel of 500, perhaps the whole 500 might not have occasion to go to him at all in one year.

*Mr. Evans:* With regard to the average attendance, can you tell us how this figure is arrived at?—You mean the general average to which we reduce them?

Yes. I suppose an average is taken so often, every three months or six months?—No. Originally we started taking an average every three months. First of all we took a general average every month and paid every month, and then, when the three-monthly payments came on, an average was taken on the three months and then we found the question of duplication, patients being seen twice in two succeeding three months, so that he appeared on two separate units, and we had to go back to the yearly system and make payments on account. Manchester stopped at that. Salford went further. They thought the taking of a general average was not fair because the men who were giving excessive or unnecessary attendance—put it which way you like—would naturally bring up the general average by the mere fact of their attendance. We adopted the golfing system and we fixed a practitioner should do it in, and they

That bogey is revised from time to time of the course. allowed for bunkers?—No. In Manchester, curiously enough, a man is allowed to come up and urge special circumstances. It is a special circumstance perhaps that he has a very small list and has only had two patients, and one of those a case of pneumonia, and that it is unjust that he should be reduced. We reply, "If you have only two patients on your list why do you trouble to practise in the Salford area: if you are so greedy that you want two patients there, you must take what we choose to give you."

*Mr. Evans:* What are the factors which decide the bogey; is it the pool?—No. The bogey would naturally be the question of attendance. Bogey is decided on the average attendance of certain practitioners. It involves knowing the practice of a certain class of work he does, and the type of patients he has. It is a question of personal intimate knowledge. (The witness withdrew.)

*Chairman:* I come now to Section C—Regulations and terms of service. In paragraph 35 you lay stress on the fact that the

conditions under which medical advice and treatment is given under the scheme should approximate as nearly as possible to those of private practice, and should preserve professional customs and traditions. We should be interested to know whether, as a result of the twelve years' working of the present scheme, there has been any appreciable and detrimental departure from these conditions?

*Dr. Brackenbury:* Speaking generally we should say no, but with your permission it might be worth our while to examine that a little more closely, as it has a considerable bearing upon the subsequent paragraphs. What we feel is this, that with one exception which I will not mention, the contract and relationship between the doctor and the patient is the same in insurance practice as in private practice. In private practice there is, though not a written, a perfectly legal contractual relationship between the doctor and the patient. The doctor undertakes to devote his utmost skill and care to the attention of the patient, and if he does not do it the patient can sue him at law. There is, therefore, a definite legal contractual relationship, though unwritten, between doctor and patient. That holds in exactly the same way and to exactly the same extent between the insurance practitioner and the insured patient. There are some additions in the insurance service to the contract that the doctor enters into. With regard to doctor and patient, there is only this one additional circumstance: he has converted an obligation of humanity, if I may say so, into an obligation of contract; that is to say, in the ordinary way, in ordinary private practice, if a patient comes to you in however great an emergency you are legally at liberty to say, "I will not have anything to do with you, I will not attend you." Even if he is dying there is no compulsion in law that you should do it, though as a matter of fact and as a matter of humanity such an attitude would never be adopted. That is contracted for in the insurance system. The whole body of insurance practitioners in an area have contracted, have recognized liability to all the insured persons in that area, and that reduced to the individual case means that on the first occasion on which an insured person consults you, even if you do not mean to accept him on your list, you give him the necessary attention, and as a matter of fact in an emergency you contract to give attention to the patient of another doctor. So that with that one exception, which is after all scarcely an exception at all, because it is merely putting into a contract what is habitually done from motives of humanity, the relationship between doctor and patient is exactly the same whether under the insurance system or otherwise. Beyond that, the insurance practitioner has undertaken to do certain things for the Approved Society in the way of certification, and for the State and the community in the way of certain records, reports, and so on. We are a little apprehensive—it is rather apprehension of the future than experience of the past that we have in mind—lest under any new regulations there shall be anything additional to that relationship between doctor and patient, which we want to keep the same in insurance practice as in private practice, and we also want to make as little onerous as possible to the doctor and as reasonable as possible to the doctor the additional contract which has been entered into with regard to certification, reports, and so on.

In paragraph 36 you state that the right of any registered medical practitioner to participate in the service is essential. We have had from other quarters suggestions that the Insurance Committee should be able to make representations to the Minister against the inclusion of a doctor where they consider that there are good reasons for doing so. You would strongly oppose this, would you not?—Yes.

Perhaps you would give us your reasons?—There is already one legal body established which regulates entry into the profession, and we do not think there ought to be one standard for one doctor and another standard for another. This is a service within the profession, but it covers so large a part of the clientele of every doctor that we do not think any doctor, having fulfilled all the requirements of the General Medical Council, should be at once debarred from a very important, the most important, area of his possible field of practice. We say that every doctor, as a matter of fact, when he has established his status in the profession according to the requirements of the law and the General Medical Council, ought to be at liberty to take part in this service, whether as at present a general practitioner or under our proposal a consultant and specialist, till he has been proved to be unworthy of the service, and if he is proved to be unworthy of the service we are at one with everybody else that it may be to the advantage of the service that he should be excluded. But we should oppose very strongly any limitation on the right of a registered medical practitioner to enter the service at all. *Dr. Cox:* May I say on this that a former witness, Mr. Potts, in giving evidence for the National Association of Insurance Committees, made a very positive statement that the British Medical Association had agreed that there might be this limitation by the Insurance Committee on the right of doctors to go on the panel. Knowing Mr. Potts as well as I do, I felt sure there was a misapprehension. I wrote to him on seeing the evidence in print, and I told him I did not remember any statement of this kind that the Association had made, and I have an answer from him which shows that there had been a misapprehension. I thought I had better clear that up now.

In paragraph 37 you indicate that the freedom of the insured person to change his doctor at any time has reduced the need for regulations governing the conduct of practitioner and patient because the present position approximates closely to that of private practice. Does there not remain, however, the fundamental difference that in the insurance service the practitioner is paid out of a statutory fund derived from contributions levied on the workers and their employers, and that in private practice the maintenance of a certain standard of service is necessary? *Dr. Brackenbury:* A certain amount of regulation is necessary, but I have been clear in

what I stated in answer to your first question it is clear that as far as doctor and patient are concerned this method of payment makes no difference. What the State contracts for is that the doctor should do for his insured person what he would do for the private person—devote his skill and care and attention to the best of his ability to that case, and this can only apply to the other contractual matters. As between doctor and patient there is nothing in the method of payment which affects the situation. *Dr. Holm:* The profession as a whole feels very strongly (and in particular those outside the Insurance Scheme at present feel that if they are to participate in it at any future time) that it is necessary that any regulations shall only be in regard to administrative procedure and the arrangement of it, and not anything which would interfere with the mode of treatment given by the doctor or the relationship between the doctor and patient in a medical sense.

In paragraph 38 you suggest certain requirements which should be imposed upon insured persons. As to the first—namely, that the insured person should seek acceptance by a doctor before the occasion for medical treatment arises—is there not a real difficulty? As an ideal this would no doubt be desirable, but do you think that the whole insured population could be expected to conform to this requirement? Must the system not allow for a certain amount of carelessness or at least natural procrastination? *Dr. Brackenbury:* Yes; but that does not affect our proposal that it should be made an obligation upon the insured person to do this, there being, as we have said, a liability to a penalty, or a fee, whichever is thought in the public interest to be the best way of applying it, on the first occasion on which it is discovered that he has not done it. No doubt there would be a number of cases in which there would be excuses for the insured person and liability to penalty would not mature; but we do think, and our opinion is very emphatic now—at the beginning it was not so—but we do think the insured person ought, at least in the great bulk, to be so impressed with the thing as an insurance scheme that this should be required of him. It is a simple requirement. The penalty could only occur once in a lifetime, and in the case of reasonable excuse it would not be imposed, but it is important that there should be a general requirement that the insured person should recognize that this is an insurance scheme and should come to his doctor before the liability for which he is insured has in fact matured.

May I infer from paragraph 39 that you agree to a continuance of the arrangements for allocation of insured persons to practitioners if they have difficulty in securing acceptance in the ordinary way, and of the principle of collective responsibility of the profession for all insured persons in the area?—Yes.

In paragraph 41 you make an interesting suggestion for simplifying the complaints procedure—namely, that the complaints should in the first instance be submitted to the Chairman of the Local Medical Committee and the Chief Administrative Medical Officer of the area. Would this not place the decision of these questions too much in the hands of professional men? Is some lay element not desirable even in a court of first instance?—It is possible that we should in some degree modify the actual wording of the paragraph, because I think there has just been this little confusion of thought perhaps on our part between the system of complaints as it at present exists and the system of complaints as it would be under the restricted system that we advocate in our Statement. If the system that we advocate is adopted, as far as questions of behaviour as between doctor and patient are concerned the thing is eliminated and dealt with by the freedom of choice as in the case of a patient and doctor in private practice. If a patient does not care about the behaviour of his doctor he can go to someone else, and the doctor, if he thinks his patient is not behaving properly towards him, can ask him to go somewhere else. If that is adopted and we have the restricted area of complaint laid down in our Statement, then I think it is possible that we should agree that even in the first instance the introduction of the lay element would not be improper.

We note your criticism in paragraph 42 of the exercise by the Minister of Health of his judicial or quasi-judicial functions. You have, no doubt, read the evidence given on this subject by the representatives of the Ministry who have appeared before us. Do you wish to make any comments on that evidence?—We attach very great importance indeed to this in the future developments of the service. Recent tendencies in the decisions of the Ministry of Health have raised very great apprehensions in our mind in reference to the particular points mentioned in this paragraph. In paragraph 42 we say: "The Association desires to emphasize its view," and then we attach the very greatest importance to those four general principles in the exercise of the quasi-judicial functions which we set out there. We are very much afraid that one or two recent decisions of the Ministry have shown a tendency to violate those principles, and if we are right in the interpretation of the method and results of those cases, we view it with the very gravest apprehension. The points are set out there—(1), (2), (3), (4). The gravest and most vital is (4). The others are of very great importance, but we are emphatic in our opinion that there should be no attempt by the Ministry of Health to pass a judgement upon the method of treatment adopted by any doctor in any particular case, or as to the relative professional skill of Doctor A to Doctor B, provided that the whole of the professional skill of Doctor A is carefully and properly given to the patient. We cannot allow any lay, or even any medical, body if you like, to set up a standard of treatment which has to be adopted, or a method of treatment which has to be complied with, and we rather think that in one or two recent cases there has been a tendency to interpret the regulations in that direction by the Ministry of Health. That is with us, of

# Minutes of the Association's Evidence.

[SUPPLEMENT TO THE  
BRITISH MEDICAL JOURNAL 237

course, vital professionally. But these are all very important. For instance, there was one case which was dealt with in full, from which there have been certain further developments. I have to desire to go into particular cases, but there are five or six cases which one has in mind. One, however, wants to establish these principles: that the machinery agreed upon for these judicial inquiries has been complied with—where the Insurance Committee has adopted one particular decision—it seems to us entirely improper that the court of appeal—the Ministry—should step in and write a letter to that Insurance Committee suggesting they should alter the charge and proceed differently.

I quite understand. In paragraph 41 you pronounce definitely against the arrangements under Section 21 (4) of the Act. Would you amplify these objections under Section 41? You pronounce definitely that medical officers are paid by salary, and (b) that their appointment and control is entirely in the hands of a purely lay committee? Surely these conditions hold in the case of all public health appointments?—Dr. Cox: As regards payment by salary, we do not regard that many medical men are paid by salary and that there is no objection to that. But we do not see any particular reason why a certain number of medical men working the Insurance System should be paid on a different system from that which obtains elsewhere, although many salaried medical officers are employed under the control of a lay committee. I do not know of any lay committee, which has the employment of medical men, with so little of real public responsibility as the committees of these particular services. It is a very different thing for a medical man to be employed by a public authority—a responsible public body—and to be employed by the same amount of public check, which there is nothing like the same amount of public check. We are against these institutions because we know they do not get the quality of medical men which is prevalent in the ordinary panel system. We know that medical men of good quality fight shy of these institutions; they do not like them, and the profession as a whole does not like them. Their whole history and origin is tainted; they never have been popular in the profession, and they never will be.

You state in paragraph 44 that the standard of treatment given by these institutions is not equal to that given by the insurance service as a whole. Have you any evidence in support of this?—Dr. Cox: Again, in Appendix II, where you deal with the work of these institutions in the colliery area of South Wales, you state that the service is, on the whole, unsatisfactory compared with that given by doctors under the normal system. Could you tell us in what way in that area it has proved unsatisfactory?—There are two sets of questions. First, as regards the standard in the "21 (4)" institutions, you ask if we have any evidence in support of the view that it is not up to the normal standard. Evidence comes from medical officers who have been, or still are, employed by these institutions, and I have a sufficient body of knowledge from those men to say that they do not think the service is as good as is given outside. And from the kind of man, generally speaking, who is employed by these institutions we do not believe that their service can be so satisfactory. I cannot believe that their members have the same control over the medical officers in these institutions as the public have through the Insurance and Panel Committees over the average rank and file of the colliery areas of South Wales. As regards the institutions in saying that their influence has been very detrimental indeed to the medical service given to the public in those areas. For nearly thirty years—long before the Insurance Act came in—we have been fighting these institutions, because they proceeded on what we thought were entirely wrong lines, the theory being that he could manage the doctor. They deliberately adopted the idea of the employment of a doctor as a whole-time servant, who should be the doctor of the committee and not the doctor of the individual person, which we think is wrong; it is fundamentally against the provisions of a good medical service. The result in South Wales, as is known to everybody who has studied the situation, is that the quality of the medical men who are going into the medical profession in the colliery areas of South Wales is not so good as it used to be, and it certainly is not so good as in any other industrial area. I say that with a full knowledge of this area, which I possess probably to a greater extent than anybody who does not live in it.

Sir Humphry Rolleston: Is there a profit made, and if so where does the profit go?—These institutions are set up not only for dealing with insured persons, but with their dependants—their wives and families. I think from a long study of these institutions difficult to prove that some of the money which is paid into the institutions on behalf of the insured persons goes to help to finance the medical attendance on the dependants. Dr. Bolam: Would it make it clear if I said that in any event the amount of money which is put aside for the doctor who attends these persons, and that under the system which is adopted it could be shown that a less amount of money would be paid to the doctor under that system than for a corresponding number of people under the insurance system?

Do you mean to say that the doctors are sweated?—Dr. Cox: A good many of the doctors themselves so consider; but the salaries undoubtedly have improved since the Insurance Act came in. There is no question about that.

Mrs. Harrison Bell: Is there still any considerable number of insured persons who do not choose their doctor reasonably early? I mean, would the failure to make a choice have an appreciable influence on the remuneration that the doctors received who are serving on a panel?—Dr. Brackenbury: It would make no difference at all. The whole of the Central Pool, which is calculated in respect of those persons as in respect of others is distributed among the doctors as a whole; so that collectively it would make no difference. It would make a little difference in the distribution to individual doctors. The doctor who was popular and whose liability is in fact greater (because, if a certain number of these persons who have not chosen do in fact choose, they would choose him rather than another) would benefit by it; but that is not the point. It is a point of principle in connexion with the Insurance System, and when these persons come to him it places the doctor in a position of doubt and difficulty very often as to what his position is.

On the subject of complaints, do you think that the insured persons would have the same confidence in an organization for complaints such as you indicate in paragraph 41, as they now have when they apply to the ordinary Complaints Committee and the Insurance Committee?—That would remain under our system. The machinery for dealing with complaints would remain the same as now. But in the first instance the complaint, instead of being dealt with by the Clerk to the Insurance Committee—the prima facie thing; the first dealing with the letter, I mean, before the Administrative Medical Officer—would be dealt with by the Chief Complaints Committee. I have said, we should be content to modify our proposal to the extent of admitting the lay representative, provided that the complaints to be considered were restricted in the way which we mention in our Statement.

From paragraph 44 of your Statement it would appear that there was some objection to payment by salary; but Dr. Cox rather disposed of that by saying that there was no general objection to payment by salary. The Manchester system is not payment by salary for the members of that Association who were doctoring insured persons?—Dr. Cox: Why should we? The doctors do not want it. Why should we try to evolve a system which we think is inferior on the whole to the present system?

I wanted to be quite clear on that point that there is objection—ordinary circumstances does away with the idea of competition between doctor and doctor and free choice. If you could stereotype what the choice of patients among doctors and the choice of doctors among patients to its present amount, you could, of course, calculate what the annual capitation fee came to in every individual doctor's case, and you could call it a salary. But we desire the doctor's person and the doctor to be free to vary that at any moment they like, as in private practice, and that the insured person can at any moment go to another doctor. That being so, it can only be done by a system of payments which allows of that equitable variation.

In fact the insured person does not go to another doctor?—Oh yes, he does. Wait one moment. I am thinking of an insured person who is a young woman wage-earner whose whole family are not insured persons and who thinks, not once or twice or three times, but many times, who does not change her doctor even though she is not so well satisfied as she would like to be. That is a fact?—The bulk of insured persons behave towards their insurance practitioners in exactly the same way as the bulk of private persons behave to their private doctors. Most of them do not, in fact, there are a few who do—go gadding about repeatedly from doctor to doctor. But they are at complete liberty to do so, and if you stereotype an annual salary system it would result inequitably, because from year to year the salary would have to be varied in accordance with these, if you like, minor changes among insured persons and clientele.

Dr. Cook: With reference to the stricture that Dr. Cox passed a minute ago on the Welsh miners and their relation to the doctors in Wales—the colliery practitioners—I would like to know if his strictures apply only to the Welsh miners or do they apply generally to the English and Scottish miners in their relations to the doctors?—Dr. Brackenbury: I should not have thought there was much to call it a stricture—I know of—and I know many of them—the colliery areas that I know of—and I know many of them—there is no such attempt. The miners pay their doctor by a system of contribution, but they do not try to own him. In the Welsh area they want to have their own doctor under the control of the committee. He can be sacked when the committee like, and he can be hauled over the coals by the committee. That is the difference in the Welsh area compared with the other areas. Speaking for Scotland, that is not the other areas. We pay a flat rate of contribution and our members can select any doctor in their areas?—Yes.

I am speaking for the county of Fife, which I know best. I quite agree. And I venture to say that the standard of medical attendance there of our practitioners will compare favourably with the doctors anywhere in Great Britain.—I quite agree. Professor Gray: One point with regard to the suggestion of requiring an insured person to choose a doctor. You said, Dr. Brackenbury, that that would have to be done only once. Is that the case? After all, insured persons move from one area to another do they not?—Dr. Brackenbury: Quite so.

And you suggest that that should be done under a fine or, if it was not thought to offer undue temptation to the profession—if I may put it in that way—it might be that the doctor would be entitled to charge a fee for the first attendance.

My trouble is that I do not see how a fine could possibly be collected. In the case of a fine payable to a society, they have a stronger hold over the member for the extraction of money. I do not see how you are going to extract a fine of 1s. or 2s. 6d. for an offence of that kind, which everybody will commit.

I agree that everybody will commit it. A period of a fortnight or three weeks limited extend, would it not?—Perhaps so.

A person who enters into employment without being allowed the same afternoon penalty as a regular attendant would not be liable to the same afternoon penalty.

I do not see how you are going to expect a stronger hold over the community than I do not see how you are going to expect for an offence of that kind, which everybody will commit.

To a limited extent. A period of a fortnight or three weeks would have to be allowed, would it not?—Perhaps so.

It is very difficult for an insured person who enters into employment on a Monday morning to choose a doctor the same afternoon.

—I quite agree. One of the cases in which the liability to a penalty would not matured would be the case of a young insured person who, immediately he entered insurance, fell ill. He would possibly only be insured for one day, and that would be a perfectly legitimate excuse, obviously, for not choosing a doctor. The simplest plan, of course, would be to allow a doctor to charge a fee for the first occasion on which an insured person came to him who had had full opportunity of choosing him for their doctor before that time and had not done so. But we quite realize, as a profession, that certain bodies of persons would say that this suggestion offers temptations to doctors to do the wrong thing. I do not think it would really act in that way, and it would be the simplest method. On the other hand, if you say that if the doctor chose to report that circumstance to an Insurance Committee, that Insurance Committee could inflict a small fine upon that person, as, indeed, they can now for certain delinquencies, I think that would be one of the ways of dealing with it. The probability is that the doctor would not report to these Medical Institutes, you say that the great body would not decline to take service under the new Medical Association. Yes, we do.

report that the Committee could immerse in the sea the probability is that they can now of dealing with it. The probability is that they would not report a case once in a hundred times. With regard to these Medical Institutes, you say that the great majority of medical men decline to take service under the Association. May I take it that the British Medical Association encourage them in refusing to take service?—Dr. Cox: Yes, we do. In fact, every week in the BRITISH MEDICAL JOURNAL there is some thing, it is not

In fact, every week appointments are encouraged to apply to him.  
a page which contains appointments he is advised to apply to him.  
warned?—Not warned; they are advised to apply to him.  
before they take them. That is not quite the same thing. It is not  
I do not want to inquire into domestic details; but, if it is not  
breach of confidence, I should like to know how this reacts on the  
question of the distribution of medical work in the country.  
Taking the current BRITISH MEDICAL JOURNAL, I find eight Welsh  
appointments with regard to which any person desiring to apply  
for them is advised first to communicate with you.—Yes.  
for those the advice you give is fairly effective?—Not always.  
for those the advice you give is fairly effective?—Not always.

question of the U. S. BRITISH ALLIANCE. — Yes.  
Taking the current line of communication with you. — Not always.  
Appointments with regard to communicate with you. — What happens? —  
for them is advised first to communicate with you, what eventually be-  
I suppose anyone disregards the Association he may eventually be  
I suppose any member of the Association he may eventually be  
If he is a not a member of the Association he may eventually be  
expelled. If he is not a member of the Association he may eventually be  
knowing that the other man are not very likely to receive him with  
open arms, with regard to these appointments to which you refer  
person, disregarding your friendly warning that he may be expelled  
be more

So that, with regard to these appointments to which you refer from week to week, there is a possibility that he may be expelled from the British Medical Association, or that he may be more or less boycotted, or be received coldly by people in that area?—Yes. And I take it that that has, in fact, a considerable influence in preventing people from taking these appointments?—Yes, I think so. I hope so. But I raise that point is this. Last week, either you or I, I think, raised the question of the appointments which, in a way, trouble the medical profession, and I think that these appointments are a considerable

And I take it that that <sup>may</sup> be the best way of preventing people from taking these appointments. I hope so.

The reason that I raise that point is this. Last week, either you or Dr. Brackenbury told us two things which, in a way, troubled me. In the first place, you told us that there are a considerable number of young doctors who have just graduated or qualified—particularly women doctors—who are, in fact, out of employment and cannot get a job; is not that so?—Yes, just now there are.

And I think, on the other hand, you told us, or it is a matter of common knowledge from all sources, that the amount of medical work in the country is enormous; indeed, there is no limit to the amount of medical work that could be done. Admittedly doctors are extremely busy, and there is a great deal of work which is not touched which might be touched. Is it not rather unfortunate that you have these two things coexisting?—We have to take a long view. The result has been, as told by a previous witness, that in Glamorganshire, whereas they had originally, or from time to time, twenty-two of these institutions approved, there are only eight of them left now, and we believe we have been doing the public and the profession a very great service in killing these things.

Witness could not understand their decrease, but that is the reason.

Witness schemes that are put forward by other witnesses.

Now it is not merely, of course, the Welsh schemes that are put in this list. There are also, I think, a considerable number of public and non-public appointments for the inspection of school things. The witness could not understand their deacease, but reason?—That is one of the reasons.

What is your objection to that type of appointment in certain cases?—They do not come up to the standard of salary which has been laid down by the Association.

They are too badly paid?—Yes, that is so.

How does this react on the question of these women doctors? What is your attitude, may I ask you, with regard to women doctors? Do you receive them with open arms?—The women, you find, are at least as loyal as the men, and at least as anxious to do the right thing by the profession as anybody else. Many of them, when they are told that if they take these appointments they will be doing a bad stroke of business for the profession

which is fighting to get an improvement in the position of women, sometimes—and they do not go in for it reluctantly, sometimes?—Yes, sometimes.

They agree reluctantly in view of the fact that if they take an appointment like this, as you have told us, they will be rather cold-shouldered by their brethren, or whatever is the word used?—Yes. *Dr. Nolan*: May I say that the attitude of the Association with regard to women doctors is exactly the same as with regard to men. We have always made a stand that a registered medical practitioner should be treated on the same basis, whether man or woman.

But I wish to get into this deep question, but I put it to you to what extent the woman doctor does not want to do the kind of work as a man doctor?—Yes, and more would or

I do not wish to get into this deep question, but I put it to you that to a very large extent the woman doctor does not want, very frequently, to do the same kind of work as a man doctor?—  
*Dr. Cor:* I think the tendency is for more and more women to go in for general practice. The idea that women should only have those what you may call "pink alley" jobs and be content with them is being gradually destroyed. More and more women are being encouraged by their teachers and by the profession generally to go in for just the same things as men.  
I would have thought that the general attitude of a woman would be a certain attraction in a steady job, with not too many fixed hours away from the night bell and a very great number of fixed hours to take, let us say, a

I would have thought that the general attitude of a woman was to find a certain attraction in a steady job, with not too much responsibility, with fixed hours away from the night bell and all the rest of it, and that, in actual fact, a very great number of women doctors would be quite prepared to take, let us say, an appointment under an Education Authority, even though their income was not so big as was available in private practice, merely because the life was less strenuous?—I think if you put that point of view up to a class of senior women students they would fall highly insulted.

The women practitioners of two years' standing would I think, even less content to be employed by a local authority than the women practitioners of five or six years' standing. May I say anything more?

But if it was put to the women practitioners of two years' standing, what would they say?—The woman practitioner of two years' standing would be, I think, even less content to be satisfied with a blind-alley job. Dr. Holtz: The great difficulty is, not that the women are anxious to have leisured occupations, but that the public is not educated to receive the woman practitioner for full general practice. It is only in certain areas that her opportunity arises. She is quite willing to grasp it if she only has the chance, and on the whole she is not looking specially for a sheltered occupation at a reduced fee. I do not, however, see quite how this comes within the scope of the present investigation. You may say that the doctors receive from acceptance of medical skill. I

I will tell you why it comes within that scope. I think it is a point which  
that there is a certain uneasy feeling in the minds of medical skill. I  
that the discouragement leads to a wastage of medical skill. I  
ing certain appointments leads to a hostile manner. I think it is a point which  
am not saying this in a hostile manner. I think it is a point which  
you ought to have an opportunity of explaining, because I am  
sure in my own mind that the feeling does exist that the British  
Medical Association prevents certain people from taking a job  
which, left to themselves, they would be quite prepared to take,  
and which they would consider themselves well paid in accepting.  
But they cannot take the post, and the result is that at the one  
end you have a certain amount of unemployment and at the  
other end you have doctors overworked and work not being done.

We quite appreciate your view. But taking these "24 (3)  
—We are bound to take a long view for a young man  
and we are bound to say to the public  
on qualifying, seems  
or even more—that

and which they cannot take. But taking those  
But they have a certain amount overworked and  
end you have a certain number of doctors who  
other end you appreciate your view. But taking these for the public  
—We quite approve of your view. But taking these for the public  
appointments, we are bound to take a long view for the young man  
and for the profession, and we are bound to say to a young man  
who wishes to take an appointment which, on qualifying, seems  
an attractive appointment—say £600 or £700, or even more—that  
at the end of a term of years he will find that he has no incentive  
—no continuing interest—in this particular appointment; whereas  
if he had gone into general practice and had got an assistantship  
and worked with a few to a partnership, he would have found a  
incentive to continue, and particularly would have found a  
valuable in his practice. He would also find that he was  
free from any restriction by a self-elected, self-constituted lay  
body which is not open to our young men: "You may find  
is the point we have to put to our young men at the caprice of a body  
yourself, at the end of five or ten years, at the caprice of its accounts or  
which cannot be looked into publicly in regard to its conduct and  
its action. You may find yourself dismissed without a cent and  
with no value from the work which you have put into your  
profession." We are bound to tell our young men that and that  
we believe it has a detrimental effect on the professional relation-  
ship between doctor and the public. We are bound to stand for  
the individual relationship in regard to these institutions. Dr.  
*Dain*: May I say that Professor Gray will appreciate question in the  
attitude on this does not affect the employment question and only  
profession; that is to say, there is only one appointment and only  
one person can hold it. The price at which it is held does not  
affect the number of employed or the amount of unemployment  
which occurs in the profession by reason of any attitude we may  
take as to the conditions of service in that particular job. We do  
not make the employment less.

somebody else who might  
be released to assist  
here doctors are, in fact,  
employed on the same basis

one person affect the number of emigration by reason of the service in that particular take as to the conditions less.

If an appointment were taken by somebody else who might otherwise be unemployed, that person might be released to assist in the general work at the other end, where doctors are, in fact, being overworked. But there is only one person employed on the work, and that releases some other potential person for some other work.

**Mr. Bell:** Is it not a fact that there is a general disinclination among the young men and women to take these commissions, and that they are not under satisfactory conditions of employment? Is it not the case that they are glad to get out of the service, and that they are not under satisfactory conditions of employment?

*Mrs. Harrison Bell:* Is it not a fact that there is a general disinclination on the part of the young men and women to take these public appointments?—*Dr. Cox:* No, not under satisfactory conditions. If the conditions are satisfactory some of them are glad to have the assurance of a steady income and reasonable vacations, and a life that is not so strenuous as that of a general practitioner. In arranging any scale of salaries that we think is equitable, we take into consideration that there are these considerations against the remuneration that ought to be expected by a general practitioner.

**Mr. Frost:** With regard to these Medical Aid Societies in South Wales, could you tell us how they are financed? How do they get the money? As regards the insured persons, from the Insurance Committee. As regards the dependants, by deductions from the colliery. And these moneys are collected from the various colliery companies. Do you object to that sort of thing at all?—Not in the least. But is done in every colliery area that I know, nearly. That is particular to Wales, of course.

**Mr. Frost:** Instead of leaving the head of the family to choose his doctor from all the doctors in the area, they have brought in a salaried man who is the one doctor in the scheme, and tried to have him upon all their contributors, or upon all the miners, at the expense, of course, of the service previously given was not in the suggestion, then, that the service may have been better. And that is the kind of service that it is wanted to continue. And that may have induced them to try this system; but I think it has been a fatal experiment.

**Mr. Frost:** I have evidence that the service is not as good as in other parts of South Wales in the last fifteen or sixteen years. And that are not connected with these services and the quality of these societies, and has not that rather a tendency to be a vicious circle, I admit. But in addition to that the medical man with legitimate practice of his own. He cannot stand it. Why should he? He is interested in the South Wales miner was a sort of man who was interested in what he did?—I said he was politically and considers himself capable of running anything. You do not object to that?—No. **Dr. Holam:** We took it that **Dr. Cor:** as they leave the doctor alone they can run anything else like.

**Mr. Frost:** You do not object to their endeavouring to conduct all the agencies which cater for their welfare?—No. One of those agencies is the medical attendant. Do you object to that?—Yes. I object partly because it is contrary to the tradition of the profession and partly because my experience shows it to be disastrous to the public. **Dr. Holam:** We do not object to their being interested. The principal thing we object to is the fact that they take in employing one whole-time doctor for the whole of their members, whether the members like him or not. We do not object to their being interested in it. **Dr. Cor:** Yes; I believe that you know anything about them?—**Dr. Cor:** Yes; I believe that you do. They are very adequately equipped. They have spent a good deal of money on equipment. One or two that I know particularly well are very well equipped. So that your chief objection is that you have a lay committee which offers are sometimes quite adequate?—Some of the salaries are with the doctor's treatment, but I should say not as a rule; that is not the objection. The objection is not leaving the individual person to find his own doctor in the area without any control or direction by a committee at all. The average person is quite capable of choosing his own doctor without any committee doing it for him.

**Mr. Frost:** In all these big industrial areas—I know it is so in South Wales in particular—you have certain firms of doctors who contract with three or four assistants. You always have the head of the firm and he may have a large number of assistants. I think it has been capable of a good deal of abuse in the old times when a man ran a big practice by means of a large number of assistants. It certainly is not as good, in my opinion, as where the individual doctor runs his own practice. You do not blackball these, do you?—No; and sometimes it is absolutely essential to have an assistant or two in order to enable the practice to be carried on. I do not see a very big difference between those people and these Medical Aid Societies. I have a place in mind now where there are three firms, each of them employing some three or four assistants, and there are 7,000 to 8,000 men working at the collieries. **Dr. Holam:** May I say on that that you have then the choice of ten or twelve doctors, because within a firm you have a number of ten or twelve doctors, do you?—Most certainly. You do not count the assistants, do you?—They have assistants; but there may be other doctors in that area who, as a rule, are not available to members of the Institution. In Northumberland and Durham, of which I have considerable experience, the medical men are there remunerated from a pool which is collected exactly in

the same way—that is, at the source, at the colliery offices; but any doctor who is in that area whose name is taken by the colliery is available to any of the insured persons there and to the dependants under the scheme. There is no restriction of choice, and the contract is between the doctor and his patient. I do not see the difference here at all. If you have, say, three firms and each firm has three or four assistants, which appears to be the prevalent system throughout the whole of South Wales—I do not know whether it is the same in other industrial areas—choose that man and they have the services of his assistants as well. What is the difference between that and the Medical Aid Society? For the life of me I cannot see it. **Dr. Cor:** Do you mean the difference from the doctor's point of view or from the patient's point of view? From any point of view.—The patient's point of view is practically the same, of course. He deliberately (if he does it deliberately) chooses the Medical Aid Institution. **Dr. Holam:** Dr. Cor does not mean that in the literal sense! **Dr. Cor:** In your other case, if an assistant is not popular the principal would get rid of him; but the principal is responsible and the patient can demand the services of the principal. Your chief objection is the lay control all the time?—That is fundamentally the chief objection. The lay control of an Insurance Committee is not comparable, because it is a public body and it has medical representation on it. The committees of some of these Medical Aid Associations are riddled with intrigue and are conducted in a way which is not at all satisfactory. I think that ought to be substantiated, if you like to read between the lines supposed to be favourable to these institutions. The evidence of Mr. Eynon Lewis was the most subdued evidence in favour of institutions that I ever heard, and he was supposed to be a favourable witness. To my mind it was very unfavourable evidence. That is the impression left on my mind.

**Mr. Frost:** In paragraph 42 apparently the British Medical Association objects to all sorts of people coming in. Even the Ministry is objected to. **Dr. Brackenbury:** No, we do not. **Mr. Frost:** How does that read?—If you will read it I think you will see that is not so. I thought you said you did object to the Ministry coming in?—Not at all. You said you had serious apprehensions?—If the Ministry interprets the regulations in a particular direction we should have strong objections to that interpretation. We have no objection whatever to the Ministry fulfilling its administrative and quasi-judicial functions—not the least. We desire that it should be so, and we desire that it should have the confidence of the profession in doing so. **Chairman:** I now come to Section D—Administration—and I propose to deal particularly with paragraphs 45 to 50. Your first principle is that the administration of cash benefits should be separated from that of all the treatment benefits and that the latter should be controlled locally by a new authority. Is this so?—Yes, the new authority controlling as well all other health services.

**Mr. Frost:** You suggest that the new authority might either be established ad hoc or be a statutory committee of the county council or county borough council. Do you lean to either of these types, or would you be satisfied with either?—We should be satisfied with either, but you will remember that we say that the county councils and county borough councils are not always in their present form the best areas for the purpose. The proposal then would mean the disappearance of the Insurance Committee and the unification under the new authority of the medical services at present administered by the Insurance Committee, the Public Health Authority, the Poor Law Guardians, and the Education Authority. As chief officer of the new authority you would have an administrative medical officer of high standing both in medical knowledge and in administrative work, who I suppose would be a salaried officer?—Yes. And you would, I presume, place under him a certain number of salaried officers to carry on the school work, the tuberculosis treatment, the infectious diseases work, the venereal disease work, the maternity and child welfare centres, and the other public health activities. Is this so?—Not exactly. There would be no doubt in the largest places the need for a certain number of sub-ordinate salaried officers for administrative purposes; but for treatment purposes we do not contemplate the appointment of salaried officers at all, except, as we have explained in one paragraph and in our evidence last time, for a limited period of time for tuberculosis or venereal disease services. The actual treatment work as distinguished from administration, or we may even say for tuberculosis or venereal disease services, for the provision of the insurance system for domiciliary attendance or on the seasonal treatment for the dependants of the insured person. The family doctor for the dependants of the insured person. The infectious diseases hospital would be an exception, because there would be hospitals of various kinds which would have a resident officer who might be paid by a salary. I hope not too distant, probability of that being properly divided between the medical officer of health as the administrative and sanitary officer, the general practitioner, and the consultant or specialist who would be called in by him, instead of all these functions being jumbled up as they at present are, rather

inconveniently, in the person of one salaried officer. But at the moment that is not contemplated as immediately possible.

What about the dental and ophthalmic treatment? Would you arrange for these by capitation fee or by scale, or by a combination of these two methods?—Of course we do not separate these things in our scheme from other specialist and consultative work. We regard them merely as varieties of that work. Therefore the ordinary method of payment for this specialist and consultative work must be, we think, by items of attendance—so much value attached to particular items of attendance. It might be possible, so far as the dentists are concerned, when more information is at our disposal, to convert what is discovered to be the value of the dental attendance into a capitation system; but we do not think there is material at present for demanding that such a capitation system should be created.

Side by side with the new Health Authority you would have in the area types of take the mttee a which it to the local Health Authority in other health matters. In so far as the same local authority was administering other health services and wanted professional advice or professional opinion this committee would supply it. It would also be very useful in the matter of health propaganda.

I suppose you have not yet considered the constitution of such a committee, but would it be by some form of election under regulations?—"Election under scheme" is the general phrase. Each authority would put up a scheme conforming to certain general principles laid down, and those schemes would be sanctioned by the Minister of Health.

I come now to the very difficult question of finance. Is it your suggestion that the funds of the new Local Authority should be derived partly from the local rates and Exchequer grants as at present and partly from contributions from insurance funds in respect of the insured persons in the area?—Yes, but not all pooled into the same income. The income from the Insurance Scheme would be a separate pool for use for the insurance service, whatever that comprised, and not form part of a general income which could be used for general purposes.

In other words, the new authority would receive a payment calculated on the number of insured persons estimated to be in the area in the same way as the Insurance Committees do at present?—Yes, in respect of the insurance part of their work.

But is there not this difficulty: that the insured persons in the area would be paying in a sense twice as compared with non-insured persons for whom the services were available? Insured persons would be paying through their contributions and also through grants and rates?—No, that is not so, if you have regard to what I have said about the non-pooling of the income.

Was this difficulty not felt when sanatorium benefit was taken out of the Insurance Acts? The institutional tuberculosis service is, as you know, financed entirely from grants and rates, and so all persons in the area are on the same footing.—In so far as the administrative authority was administering a general service which was open to all alike, that would be the difficulty, but we do not envisage that in our complete scheme. In so far as they did that, there would be no charge on the insurance funds therefor.

I presume you have considered the Interim Report on the Future Provision of Medical and Allied Services drawn up by the Consultative Council in 1920. Would you indicate to us how its recommendations bear on your proposals?—Dr. Bolam is more acquainted with the details of it if you want to go into them; but in general I should say there is nothing in that which is inconsistent with the main lines of our general scheme. I think I might say, however, that the Scottish Report comes nearer to the ideal that we have than the English Report did on the whole.

We note the minor administrative matters to which you refer in paragraphs 50 to 53, and shall give them due consideration. You suggest amongst other things that the present statutory words "incapable of work" should be altered. Can you suggest any alternative form of words which you think would be an improvement?—Of course the words that we should prefer are "unfit for your work." You see the certificate is addressed to the insured person, and we would prefer it to say, "You are unfit for your work." The question then, of course, arises that at some period or other in certain cases we might have to advise and certify that the person was unfit for any work.

For any work at all?—For any work at all. There could either be the alternative form of words on the certificate from which we could cross out "all" or "any"—or perhaps more conveniently when the Approved Society or the administrative body which dealt with the matter felt that the question should arise: "Is he unfit, not for the particular work, but for any work?" they could ask for a further certificate in the alternative form.

In paragraphs 54 and 55 you enter into some questions which are not of a medical nature. At the same time we are very interested to have your views. I see that you think that Approved Societies as at present constituted do not as a whole in any sense represent insured persons, their wishes or opinions. In paragraph 54 you suggest that the administration by Approved Societies is more satisfactory and sympathetic than if the same duties were in the hands of a large State organization. If, therefore, the Society system is continued, do you see any remedy for the defect you mention?—We do not in fact make the statement which you attributed to us in your question. If I may read you the statement which we do make you will see that it is much more restricted. In paragraph 54 we say: "Many practitioners, however, hold the belief, based on experience, that this administration is likely to be more satisfactory

and sympathetic in the hands of certain classes of Approved Societies than in the hands of a large State organization or Committee of a local government authority." It is the experience of many practitioners that certain particular classes of Society do tend to be more satisfactory and sympathetic in their dealings with individuals than either the Society of a different kind or a publicly constituted authority.

*Mrs. Harrison Bell:* Do the doctors visualize very grave objections to the grouping of members in a society for a particular area on a territorial basis?—May I point out that there is perhaps a misunderstanding. We do not suggest that they should be grouped in that way; but in addition to any other registers that are kept, the Society should keep a register on a territorial basis. It is merely that the register should be there and that the Society should know at any given moment as nearly as can be in a migratory population, which of their members reside in Middlesex and which reside in Northumberland. Otherwise we are unable—that is the great difficulty of the organization at present—to apply the result of health conditions in the locality. There is no method. The doctors show that there is a certain prevalent disease. You apply to the Society and they cannot localize it at all; whereas if the Society were in addition obliged to keep a localized register it would enable various things to be done in that way and it would enable incidentally—perhaps in a minor way but still important—the doctor's lists of persons for whom they are responsible to be much more accurately kept.

*Professor Gray:* Would you just elaborate for us a little your suggestion with regard to the length of time for which a doctor might certify incapacity? You suggest a certain distinction there of 14 days in certain cases, 42 in others, and in some cases even a period of three months. From your knowledge of Approved Societies do you think that that kind of suggestion would be gratefully welcomed?—No; it would not be gratefully welcomed, and that is why we put it up to the Commission, because we have failed with the Societies. It seems to us to be eminently reasonable and in everybody's interest.

Disablement benefit can begin the moment a man is ill if it is a linked-up illness?—It can. I am afraid we had overlooked that point. We had viewed it as indicating an illness after a considerable period of time.

What is your definition of a chronic case?—I could not give you one. But our idea here was that if the same illness had been going on for a considerable period of time—say six months—the doctor might be able to give a certificate in that case only once in six weeks, the society or authority concerned having the power to appeal for that to be shortened. *Dr. Dain:* He can give a certificate for a month now. *Dr. Brackenbury:* It is extending it from a month to six weeks.

*Mr. Jones:* What need is there for the Societies to keep a separate record of sicknesses territorially?—There is a difficulty in localizing illness.

But have not you got that record already in the doctor's record cards?—Very imperfectly at all events.

But why should they not be perfectly kept?—A person has an illness and goes to another locality. The Approved Society has its records of incapacitating illness, but the Society does not know in what area that incapacitating illness takes place. It knows that each member had so many weeks of incapacitating illness during a certain year, but there are no means of telling in what area that incapacitating illness takes place.

I suggest to you that the means if properly applied exists at the moment in the doctors' records, which are territorial?—*Dr. Dain:* It is a perfectly easy matter for a Society to say that a number of its members are suffering from a particular complaint, but it is a very difficult administrative matter to obtain that information from the doctors' records. It is there that the doctors' records require to be examined, and for the continuous treatment of a patient it is impossible to take a record away from the doctor, so that it is a very big and difficult business to get it in that way. Take, for example, that, say, rheumatism was found by the returns of particular societies to be very prevalent in a particular area as an incapacitating illness. It would be possible to go to the doctors and get from them what type of rheumatism it was; but to get at the doctors' records is a very difficult and laborious way of obtaining the information, whereas it would be easily obtained from a territorial list in an Approved Society's records.

It seems to me it would be doubly laborious to do it in the method you suggest, because the society has to keep its record and write it up territorially and you have got it territorially already?—*Dr. Brackenbury:* In Scotland it is done.

What is the territory in Scotland?—The difference is that the doctor sends in his records of cases of incapacitating illness in Scotland, but he does not do it in England. *Dr. Dain:* There is a different type of record.

I was not aware of that.—*Dr. Brackenbury:* He does not do it in England.

*Chairman:* We note your observations in Section E as to remuneration. I only want to ask one question. You suggest that the position of the rural practitioner requires special consideration. But on your own principle, stated in paragraph 58, would you not agree that the present remuneration of the rural practitioners from the capitation fees and the mileage grants compares very favourably with what they could secure from a purely private practice in such sparsely populated areas?—May I repeat the answer which I gave last week to a similar question in another connexion; that is, that our word is not "could," but "should." We do not believe that the State in an insurance scheme wants to exploit bad debts, and if the doctor makes provision for these people we assume that an income to the doctor would be forthcoming from them which should in total compare not unfavourably with that which should be forthcoming for similar responsibility and work in private

practice. We admit that in agricultural areas there is so much poverty that in private practice the doctor would not in fact receive the income for his services because a large part of it would not be paid for. But assuming ordinary fees he should be able to get a certain income. Dr. Bolam: We have brought with us Dr. J. P. Williams-Freeman, who is the Chairman of the Insurance Committee in Hampshire and a member of the Hampshire Insurance Committee.

I understood Dr. Williams-Freeman would like to make a statement?—No; he is here if you want to ask him any questions with regard to rural practice. I understood that Professor Gray had some questions.

[Dr. J. P. WILLIAMS-FREEMAN, called and examined.]  
Chairman: In what way do you consider that the rural practitioner is at a disadvantage as compared with the ordinary practitioner?—Dr. Williams-Freeman: The main thing is that of payment by capitation fees according to the number on your list. In sparsely populated districts it is absolutely impossible to get more than a very small list. The result is that the payment to the rural practitioner compares so unfavourably with the payment of the town practitioner that we have great difficulty in getting good practitioners to take up practice in the country. That is the prime difficulty.

Have you any solution to suggest?—Yes; we have considered the question in committee from two or three points of view. It is to be possible that there should be the same general capitation fee for all practitioners alike throughout the country, but that in certain sparsely populated districts this should be augmented so as to raise the amount of money paid for insured persons to a proper proportion, which is generally taken to be one-third of what ought to be a reasonable remuneration for an educated medical man. That is the line, I think, on which it should go.

Professor Gray: How far, can you tell us, is the country doctor disappearing?—I have tried to find that out statistically, and it is not easy. In my own county of Hampshire we have had five country practices abandoned since the Insurance Acts came in, and only one of these has been revived.

How far is it due to this? At present, looking over a great part of the country, there are few districts where you have people who are not within reach of a town. I remember a village where one time there was a country doctor who had a complete monopoly over quite a big area. He was five miles on one side of the nearest town and perhaps ten on the other; but in the last few years with the advent of motor cars that has fallen inside the area of the normal market town, and the doctors from the market town are all over the place. If you take a large part of England, it is not the case that a great deal of what used to be the rural area is, in fact, within the scope of operations of doctors who are in towns?—That is so; but, of course, it has its great disadvantages.

I am not denying that that is possible; but it is so?—It is a tendency, not only in England, but in America and everywhere. I suggest to you that the decay of the country doctor is not merely a question of the rate of capitation fee, but the fact that the town doctor can enter into competition with the country doctor over a very wide area?—Is not that the same thing, surely? That is what leads to the decay of the country doctor.

It is the motor car and not the capitation rate?—Yes; but he goes to where he can practise and receive a much greater salary. It is perfectly obvious that a young fellow would choose a place where he could get a panel of 1,500 rather than a place where he could only get a panel of 500.

My suggestion is that the country doctor is being killed by the motor car, and you want a higher capitation fee in the country to counteract the motor car?—Yes; I want to have something to keep to a certain amount of village practice going, because I believe them to be necessary for the population.

Mr. Jones: How would you propose to administer a specialist service in rural areas?—I do not think there would be any difficulty. You could have an ambulance service which could bring in the patients whom you wish to see once a week, say; you could have certain specialists attending at the clinics in those market towns; the ordinary consulting surgeons perhaps every week; the dentist every week; the eye man once a fortnight; and the skin man once a month. In that way I do not see any administrative difficulty, even on account of finance, in providing a very useful specialist service sitting at periods in the market towns.

Does not that suggest also a solution of the difficulty about the rural practitioner? You might take the patient to see the doctor instead of taking the doctor to see the patient?—There are some patients you cannot cart about.

Chairman: We are very much obliged to you, gentlemen, for the very interesting information you have given us. Thank you very much.—Dr. Bolam: We are much indebted to you, my lord, for hearing us with such patience. (The witnesses withdrew.)

### THE ROYAL COMMISSION.

THE twenty-ninth meeting of the Royal Commission on National Health Insurance was held at the Home Office, Whitehall, on May 21st, Sir Arthur Worley in the chair. Evidence as to the organization and procedure of medical institutions was given on behalf of the Friendly Societies Medical Alliance by Mr. S. A. Syddall and Mr. Samuel Pride, on behalf of the Friendly Societies Medical Officers' Union by Dr. D. Holmes, Dr. John H. Roberts, and Dr. A. Hamilton; and on behalf of the South Wales and Monmouthshire Alliance of Medical Aid Societies by Mr. W. Conway and Mr. Evan Pugh. Thereafter the Society of Medical Officers of Health,

represented by Dr. R. A. Lyster and Dr. J. J. Buchan, gave evidence relating to extensions of medical benefit and re-organization of the various existing public medical services. Proof copies of the oral evidence and the relative statement submitted at the meeting of May 7th, 1925, may be obtained from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, on remittance of cost (3s.) and postage.

### Association Notices.

#### COUNCIL ELECTIONS.

THE names of members already declared elected to the Council for the session 1925-26 in respect of the eighteen groups of Home Branches in which there were no contests were published in the BRITISH MEDICAL JOURNAL SUPPLEMENT of May 9th, 1925 (p. 198). The following are the results of the voting in the groups where a contest took place:

##### North of England Branch.

The number of papers issued to the members of this Branch was 982, of which 445 were returned. One paper was spoilt, leaving 444 valid votes. The result is as follows:

Dr. J. Hudson (Newcastle-upon-Tyne) ... 302 Elected  
Dr. D. F. Todd (Sunderland) ... 142

##### Cambridge and Huntingdon, Essex, Norfolk, South Midland, and Suffolk Branches.

The number of papers issued to the members of the Branches in this group was 1,010, of which 339 were returned. Five papers were spoilt, leaving 334 valid votes. The result is as follows:

Dr. J. F. Walker (Southend-on-Sea) ... 211 Elected  
Dr. E. O. Turner (Great Missenden, Bucks) ... 123

##### African Group of Branches.

The following is the result of the voting in the above group for a member of Council for the three years 1925-28. The group comprises the Border (South Africa), Cape of Good Hope (Eastern and Western), Egyptian, Gibraltar, Grigoland, Orange Free State and Natal Coastal, Natal Inland, Nyasaland, Sierra Leone, Tanganyika Territory, Pretoria, Rhodesian, and Zanzibar Branches.

The number of papers issued on March 2nd, 1925, was 1,169, of which 358 were returned. Three papers were spoilt, leaving 355 valid votes. The result is as follows:

Dr. J. Barcroft Anderson (East London, S.A.) ... 263 Elected  
Mr. Alfred R. Friel (Leedon, England) ... 92

#### ELECTION OF FOUR REPRESENTATIVES AND FOUR DEPUTY REPRESENTATIVES BY PUBLIC HEALTH SERVICE MEMBERS.

THE arrangements for the election by Public Health Service members of four Representatives on the Representative Body and four Deputy Representatives provide that the first four successful candidates should act as Representatives on the second four candidates should act as Deputy Representatives, while the fifth successful candidate acting as Deputy for the first, should necessarily arise, the sixth as Deputy for the first, the seventh as Deputy for the third, and the eighth as Deputy for the fourth.

The candidates nominated were Dr. T. W. Naylor Barlow, O.B.E., Wallasey; Dr. T. Eustace Hill, O.B.E., Durham; Professor H. Kerr, O.B.E., Newcastle-upon-Tyne; Dr. D. Morley Mathieson, Birkenhead; Dr. R. Woolsey Stocks, West Bromwich; Dr. P. H. Stirk, Exeter; Dr. H. Gibbons Ward, Leamington; and Dr. R. H. Wilshaw, Worthing.

The number of papers issued was 1,051, of which 377 were returned. Thirteen papers were spoilt, leaving 314 valid votes. The voting was by the single transferable vote system and the result was as follows:

Dr. Barlow	...	Elected Representative
Dr. Hill	...	"
Professor Kerr	...	"
Dr. Mathieson	...	"
Dr. Stocks	...	"
Dr. Stirk	...	"
Dr. Ward	...	"
Dr. Wilshaw	...	"
	...	Dr. Barlow's Deputy
	...	Dr. Hill's
	...	Prof. Kerr's
	...	Dr. Mathieson's

#### BRANCH AND DIVISION MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—A general meeting of the Border Counties Branch will be held at the Infirmary, Workington, on June 5th, at 3.15 p.m. The Branch Council will meet at 3. Agenda: A British Medical Association Lecture—Gastro-intestinal disturbances in infants and young children—will be given by Dr. Hugh T. Ashby. Tea by kind invitation of Dr. J. H. Dudgeon.

CAMBRIDGE AND HUNTINGDON BRANCH.—The annual meeting of the Division will be held at the University Arms Hotel, Cambridge, to-day (Friday, May 29th), at 3.15 p.m. Agenda: Election of officers; Report of Council; suggested provision of a flag at the Association's new premises.

DORSET AND WEST HANTS BRANCH.—The annual meeting of the Dorset and West Hants Branch will be held at the Hotel Burlington, Boscombe, on Wednesday, June 3rd, at 3 p.m. Agenda:

Communications; consideration of (n) Branch Council report, (b) Bournemouth Division report, (c) West Dorset Division report; confirm election of new officers; election of five representatives to Hospital Committee; date and place of next meeting; papers:—(a) Mr. Richardson: Caesarean section; (b) Dr. Oswald Rees: Heat exhaustion. The Bournemouth members invite visitors to lunch at the Hotel Burlington, Boscombe, nt 1.30 p.m.; the President will provide tea at the Hotel Burlington after the general meeting.

**EDINBURGH BRANCH.**—The annual meeting of the Edinburgh Branch will be held at Craighouse on Wednesday, June 17th, at 5 p.m.

**KENT BRANCH.**—The twelfth annual meeting of the Kent Branch will be held on Thursday, June 11th, nt Chatham. The President-Elect, Dr. A. W. G. Woodforde, kindly invites members and their wives to luncheon at 1.30 p.m. at the Tea Table Café, 79, High Street, Rochester (opposite Cathedral). The annual meeting will be held nt 3 at the Naval Hospital, Chatham, by kind invitation of Surgeon Rear-Admiral C. Marsh Beadnell, C.B., R.N., and Surgeon Captain R. J. MacKeown, O.B.E., R.N. Agenda: Receive report of election of new officers, who thereupon take office; vote of thanks to retiring officers; report of Branch Council and annual financial statement; appointment of auditor. President's inaugural address: Hypertrophy of the prostate gland. Members and guests are invited to tea and to inspect the Naval Hospital. During the day the competition will be carried through for the Tennyson Smith golf challenge cup. Intending competitors should at once send in their names, addresses, and handicaps to Dr. J. G. C. Taunton, 5A, New Road Avenue, Chatham, who will give all necessary information. At 6.30 the annual dinner will be held at the Sun Hotel, Chatham (tickets, 7s. 6d. each; wines and smokes will be kindly provided by the Rochester, Chatham, and Gillingham Division). The golf cup will be presented to the winner at the dinner, and the local Division will present a replica as a memento.

**METROPOLITAN COUNTIES BRANCH.**—The annual general meeting of the Metropolitan Counties Branch will be held at the British Medical Association House, Tavistock Square, W.C.1, on Tuesday, June 23rd, at 4 p.m. Business: (1) Report of scrutineer on election of officers; (2) Annual Report of Council; (3) Report of Representatives of the Branch on the Central Council; (4) President's address, by Mr. Comyns Berkeley.

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.**—A meeting of the Lewisham Division will be held nt St. John's Hospital, Lewisham, on Tuesday, June 16th, at 8.45 p.m., with Dr. R. G. Chase in the chair. Dr. Offenheim will give an address.

**METROPOLITAN COUNTIES BRANCH: ST. PANCRAS DIVISION.**—A meeting of the members of the British Medical Association and other practitioners residing within the area of St. Pancras will be held nt the Midland Hotel, St. Pancras, N.W., on Friday, June 5th, at 4.30 p.m. precisely, to consider the ..... Division. Agenda: (1) To elect a chairman will be proposed: "That this meeting approve of the St. Pancras Division of the British Medical Association." (3) The following officers will be elected: (a) Chairman of the Division; (b) Vice-Chairman of the Division; (c) Honorary Secretary and Treasurer; (d) Representative on Representative Body; (e) Representative on Branch Council; (f) Members of the Executive Committee. (4) Such other matters as may arise. (5) It will be further proposed: "That a copy of the resolutions passed at the meeting be sent to the Metropolitan Branch Council with a request to make them effective as early as possible."

**METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISION.**—The next meeting of the Westminster and Holborn Division will be held on Thursday, June 11th, at 8 p.m., at the Clinic, 86, Brook Street, W.1. A good attendance is hoped for.

**SOUTHERN BRANCH.**—The fifty-second annual meeting of the Southern Branch will be held at Bree's Royal Hotel, Jersey, on Thursday, June 11th, at 2.45 p.m., when the President, Dr. Henry Devine, O.B.E., will take the chair. Agenda: Annual report of Branch Council; financial statement for 1924-25; election of officers; vote of thanks to the retiring President. At the conclusion of the above business, Dr. Henry Devine will vacate the chair in favour of Lieut.-Colonel P. M. Bentlif, M.B.E., who will deliver an address entitled "Reminiscences." Members wishing berths on the boat and rooms at the hotel to be reserved should communicate with the honorary secretary, Dr. Lockhart Stephens, White House, Emsworth, Hants, not later than June 3rd.

**SURREY BRANCH: GUILDFORD DIVISION.**—The annual meeting of the Guildford Division will be held on Thursday, June 4th, at 4 p.m. at the Royal Surrey County Hospital, Guildford. Tea at 3.45. Agenda: Election of officers; receive (a) annual report of the Executive Committee, (b) report and accounts of the Division; consider fees for medical examination of Territorial recruits; consider Annual Report of Council, and instruct the Representative. Members are asked to bring with them the SUPPLEMENT to the BRITISH MEDICAL JOURNAL for April 11th and 18th, 1925.

**WORCESTER AND HEREFORD BRANCH: HEREFORD DIVISION.**—The annual meeting of the Hereford Division will be held on Monday, June 8th, at 20, East Street, Hereford, at 2.30 p.m. Agenda: Election of officers; consideration of Annual Report of Council, and instructions to Representative (members are asked to bring to the meeting the SUPPLEMENTS of April 11th and 18th); mileage fees in emergency midwifery cases; school medical officers.

**YORKSHIRE BRANCH: HUDDERSFIELD DIVISION.**—The annual picnic arranged by the Huddersfield Division will take place on Wednesday, June 10th. The charabanc will leave York Place at 12.45 p.m. for Skipton and Burnsall. Afternoon tea will be served at the Red Lion Hotel at Burnsall, about 3.30. About 4.15 the charabanc will proceed to the Strid, near Bolton Abbey. Dinner at the Devonshire Arms Hotel, Bolton Abbey, at 6.15.

## GENERAL COUNCIL

OF

### MEDICAL EDUCATION AND REGISTRATION.

#### SUMMER SESSION, 1925.

THE one hundred and twenty-first session of the General Medical Council was opened at 44, Hallam Street, W., on May 26th. The President, Sir DONALD MACALISTER, K.C.B., was in the chair.

Official notification was made of the election of the direct representatives for England, Scotland, and Ireland, and the one direct representative who came freshly to the Council, Dr. H. B. Brackenbury, was introduced to the President by Dr. J. A. Macdonald, and took his seat.

#### PRESIDENT'S ADDRESS.

The PRESIDENT delivered the following address:

Gentlemen,—A former colleague of the greatest distinction, the Right Hon. Sir Thomas Clifford Allbutt, Regius Professor of Physic in the University of Cambridge, passed from us nt an advanced age, but in full intellectual vigour, in February last. His high place as a leader in many departments of medicine, pre-eminent in his mastery alike of its literature, its science, and its practice, will not soon be filled as he filled it. In the Cambridge chair he is succeeded most fittingly by his distinguished collaborator, my old pupil and life-long friend, Sir Humphry Rolleston. To him I venture, on behalf of his fellow members here, to offer our sincere good wishes for his happiness in that important academic office. Another fellow student at St. John's College, Cambridge, who five years ago was associated with the Council's work as its inspector of qualifying examinations in medicine, Dr. H. H. Tooth, of St. Bartholomew's, has died, too early, within the present month. He leaves a memory of assiduous and unselfish labour for worthy ends, and of a genial temper in his social and professional relations that endeared him to all who knew him.

We lose at this time, though happily by no tragic vicissitude, Mr. E. B. Turner, our colleague as an English Representative member since 1920. His vigorous fluency of address, and his intimate acquaintance with divers sides of medical life and practice, often gave colour to our grey debates. His place is taken by Mr. Henry Britten Brackenbury, M.R.C.S., who came into office on January 1st, 1925. The fact that he headed the poll at the recent election by a majority of more than 8,000 votes over the highest of the non-elected bespeaks the confidence he has inspired among English practitioners by his sagacious efforts for the advancement of their true interests. We welcome him here as an experienced medical statesman of approved loyalty and wisdom. We welcome also, under his new and well won title, Sir Holburt Waring, our zealous and trusted senior treasurer. May he wear the title long; he is sure to wear it well. Let me close my personal references with an expression of our satisfaction that the Government of India has, notwithstanding his retirement from the assistant directorship of the Indian Medical Service, renewed the appointment of Colonel Needham, C.I.E., D.S.O., as inspector, on the Council's behalf, of medical education in Indian universities and colleges. His latest reports have just reached the Executive Committee. They have enabled the Committee to take decisions in furtherance of the improvements already initiated in the methods and standards of important provincial schools of medicine in India.

#### Irish Free State.

Last November I reported to you that the position of the Council, as regards medical education and registration in the Irish Free State, had not then been authoritatively determined. In February last, however, an Act was passed by the Free State Legislature, which made our position clear for a year at least. The Act in effect provides that in Southern Ireland the Council's constitution and powers, and the powers and responsibilities of its universities and corporations, shall, so long as the Act is operative, continue to be regulated by the Medical Acts, as they were regulated before the Irish Free State was established.

It is, of course, open to the Free State, if it thinks fit, to renew the Act for a further period before its expiry in February, 1926. No similar Act has been passed relating to the dental profession, and accordingly the jurisdiction of the Council and of the Dental Board over dentists in the Free State has come to an end. I have not learned that any local regulation of the dental profession has been established in its stead.

It still remains, for the complete validation of the Council's powers, and of its acts in the interim period, that complementary legislation should be adopted in this country. We are informed by the Privy Council that the necessary bill has been drafted, and will shortly be laid before Parliament.

#### Italy.

The question of re-establishing medical reciprocity with Italy, interrupted by recent legislation to the detriment of British medical men desirous of practising in that country, has been the subject of much correspondence during the recess. At one time it appeared that, owing to the unexplained delay of the Italian authorities in concluding the "special agreement" required by the new law, it would be necessary to rescind the Order in Council which applies the Medical Act of 1886 to Italy. But an intimation by the Executive Committee to that effect seems to have had a useful result; for we have received a telegram sent by H.M. Ambassador at Rome, stating that the agreement with Italy was signed on Thursday last, May 21st, and that the signed text was on its way to London.

#### Canada.

The Province of Saskatchewan, whose recent enactment has made it impossible for practitioners on the British Register to obtain provincial registration, while Saskatchewan practitioners still retain the privilege of registration upon the Colonial List and so of practising in this country and in British possessions overseas, has sent a reply expressing the views of its Medical Council. It is to the effect that there is no desire to retain British reciprocity with countries other than Great Britain. The Executive Committee have therefore felt constrained to represent to the Lord President of the Council that the conditions under which the Order in Council of 1915 was made have ceased to be observed by Saskatchewan, and that accordingly it is just and expedient that the Order should be forthwith rescinded.

Correspondence with the Province of New Brunswick, where a somewhat similar question has been raised, appears to indicate that inter-provincial differences and misunderstandings are responsible for the "current discontents." The local authorities, however, plead for further consideration of the question, and deprecate the rescission of the reciprocity Order until that consideration has been given. The Executive Committee have no desire to precipitate matters within the Province, and have given instructions for a reply to the provincial authorities, which shall make it clear that we agree in our desire that reciprocity with the Dominion as a whole should take the place of the present agreements with the provinces separately, so soon as the provisions of the Canadian laws render this practicable. Dominion reciprocity has long been the aim of the Council. It would bring with it a greater uniformity of provincial standards, and the elimination of local difficulties between neighbouring provinces, with which the Council cannot effectively concern itself.

#### India.

In India, the progress towards a satisfactory system of medical instruction and examination in the Universities of Bombay and Lucknow, as reported by the Official Inspector, has justified the Executive Committee in continuing the conditional recognition of their degrees until June 30th, 1926. The Committee have not yet found any grounds for reconsidering the position of the University of Calcutta, whose degrees are not now registrable in the Colonial List.

#### Channel Islands.

Those ancient domains of the Crown, Jersey and Guernsey, have, by a new Medical Act, dated March 10th,

1925, brought their law into harmony with that of the adjacent islands of Great Britain and Ireland, by requiring that practitioners, to be legally qualified, must be registered in the *Medical Register*. They have, moreover, set these islands a good example, by prohibiting, under penalty, any person who is not legally qualified from practising medicine or surgery.

#### International Conference on Pharmacopoeial Formulæ.

The International Conference on the Unification of Pharmacopoeial Formulæ is to be held in Brussels in September. The Government will be represented by four delegates, of whom our colleague Sir Nestor Tirard is one. I learn with gratification that he has been asked by the Government to act as chairman of the British delegation. The Government has adopted the reserves regarding the subjects to be discussed, and the conclusions that may be reached, which were suggested by the Pharmacopœia Committee.

#### Inspection of Dental Examinations.

The Dental Education and Examination Committee will present a report on the inspection by Mr. J. Howard Mummary, C.B.E., of the qualifying examinations in dentistry and dental surgery held during the past two years. It is good to learn that all the examinations have been reported "sufficient." In certain instances the inspector has made suggestions towards improvement in matters of detail. These have been communicated to the several examining bodies, and it is reported by the inspector that they have been accepted, and in some cases are already in operation.

The other standing committees will have reports to submit in regular course, but so far as I am aware these will relate simply to matters of detail within their respective provinces.

#### Number of New Medical Students.

This time last year I commented on the fall in the number of medical students registered—namely, from 1,833 in 1922 to 545 in 1923. The sudden decline I thought to be more apparent than real, attributing it to the recent introduction of a pre-registration test in elementary physics and chemistry. This test many students would not pass, and so could not register, until the end of their first term, at least, after leaving the secondary schools. The explanation would seem to be sound, for in 1924 the registrations were nearly doubled, reaching 1,043 by the end of the year. As the working of the new regulation is better understood in the schools, and as the general and scientific education of intending medical students is brought up to the higher standard now required, there is little doubt that the number of qualified entrants on the medical curriculum will approach the pre-war figure of 1,300 or 1,400, a number sufficient to supply the needs of the country for qualified practitioners.

#### Number of Newly Registered Practitioners.

The total number of new registrations in the Home List of the *Medical Register* in 1924 was about 2,566, or about 330 more than in the previous year. This increase reflects the very large entry of students in the years immediately following the close of the war. The steady decrease in that entry since 1919 will correspondingly reduce the additions to the ranks of the profession, and it is highly probable that in three or four years the annual increment to the Register will fall to pre-war proportions.

#### Finance.

As the income of the General and Branch Councils is mainly dependent on registration fees, it is not surprising that the receipts for the year have been considerably augmented. The expenditure has remained nearly stationary, and there is therefore a surplus, on the total account, of more than £7,000. The treasurers have thus been able to provide for exceptional outlays on elections, inspections, and visitations, fresh issues of the *British Pharmacopœia*, the establishment of an orderly system of pensions for other staff, etc., and also to lay up modest reserves for other irregularly recurring charges, without drawing on accumulated capital. These wise precautions will serve to stabilize the Council's finances for some time to come, even if the second half of the present decade is less prosperous than the

first. We have no margin for lavish expenditure; but the careful husbandry of the Finance Committee will enable us to meet without hardship any expense that is really necessary for efficiency.

#### Dental Business.

In order that the dental members may be set free, if they so desire, from the necessity of attending during the purely medical sittings of the Council, the Executive Committee, in response to suggestions from the Council itself, has arranged by way of experiment that dental business shall be taken this afternoon. Thereafter, with a view to liberating practitioners in attendance, whose cases have been heard but adjourned for judgement, we shall hear and adjudicate upon them. Wednesday and Thursday will be occupied by judicial inquiries into new charges submitted at the instance of the Penal Cases Committee, leaving the rest of the week for the consideration of our Committees' reports and other administrative business.

#### Gift of Window.

Before I conclude, may I offer for the acceptance of the Council the decorated window, designed by Dr. Anning Bell, R.A., which, with the kind assent of the Executive Committee, I have ventured to instal temporarily behind this chair? While, from the material side, it may help to brighten the sombre tints of the urban landscape over the way, and shield you from the rare importunities of the western sun, I hope that from the symbolic side it may help to preserve the remembrance of those who have been honoured by your confidence as Presidents of the Council, including the latest and longest borne with, your devoted and grateful servant.

#### Vote of Thanks.

Sir ISAMBARD OWEN proposed a vote of thanks to the President, and expressed the grateful acknowledgements of the Council to the President for the gift of the very fine window installed in the Council chamber. The vote of thanks was seconded by Sir NORMAN WALKER and carried with hearty acclamation.

#### VACANCIES.

AYR: HOSPITAL FOR MENTAL DISEASES.—Junior Assistant Physician (male). Salary £300 per annum.  
BLACKBURN COUNTY HOSPITAL.—Assistant Medical Officer of Health and Assistant School Medical Officer (male). Salary £600 per annum, rising to £700.  
BLACKBURN UNION.—Resident Assistant Medical Officer at the Institution and Infirmary. Salary £200 per annum.  
CAMBRIDGE: ADDENBROOKE'S HOSPITAL.—House-Physician (male). Salary £150 per annum.  
CHELSEA HOSPITAL FOR WOMEN, Arthur Street, S.W.3.—Two Male House-Surgeons. Salary £120 per annum for Senior and £100 for Junior.  
ESSEX ADMINISTRATIVE COUNTY, Chelmsford.—Senior Clinical Tuberculosis Officer. Salary £750 per annum.  
HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—(1) House-Surgeon. (2) House-Physician. (Unmarried.) Salary £50 for six months.  
INDIA: MEDICAL COLLEGE, PATNA.—(1) Professor of Pharmacology. (2) Professor of Anatomy. (3) Professor of Physiology. Salary for each Rs1,200 per mensem, rising to Rs1,400, plus Rs25 per mensem overseas pay if of non-Indian domicile.  
LAMBETH BOARD OF GUARDIANS.—Male Junior Assistant Medical Officer for the Lambeth Parish Hospital. Remuneration at rate of £200 per annum.  
LONDON COUNTY COUNCIL.—Junior Assistant Medical Officer (single) at Epsom Manor Institution for Mental Defectives. Salary £300 per annum, rising to £400, together with temporary additions commencing at £140.  
PUNEBURE: NAUTICAL COLLEGE.—Medical Advisor.  
ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.1.—(1) Assistant Casualty Officer. (2) House-Physician. (3) Two House-Surgeons.  
ROYAL NORTHERN HOSPITAL, Holloway, N.7.—Two Assistant Surgical Officers. Honorarium £75 per annum.  
SHEFFIELD ROYAL HOSPITAL.—Resident Surgical Officer. Salary £200 per annum.  
SOUTH LONDON HOSPITAL FOR WOMEN, Clapham Common, S.W.4.—Assistant Physician.  
SHREY COUNTY COUNCIL, Kingston-on-Thames.—Assistant Medical Officers in the Public Health Department. (Males.) Salary £600 per annum, rising to £700.  
WEST LONDON HOSPITAL, Hammersmith Road, W.6.—(1) House-Physician. (2) House-Surgeon. (3) Aural House-Surgeon and Resident Casualty Officer. Males. Salary at the rate of £100 per annum each.

#### APPOINTMENTS.

HORSBURGH, P. G., M.R.C.S., L.R.C.P., D.P.H., Medical Officer of Health for Nuneaton.  
HERRILL, George, M.B., B.S., B.Hy., D.P.H., Tuberculosis Medical Officer, Newcastle-upon-Tyne.  
MURRAY, George R., M.A., M.D.Camb., D.C.L.Dub., F.R.C.P., Emeritus Professor of Medicine in the Victoria University of Manchester and Consulting Physician to the Manchester Royal Infirmary.

#### DIARY OF SOCIETIES AND LECTURES.

##### ROYAL SOCIETY OF MEDICINE.

Section of Surgery: Wed., 5.30 p.m., Dr. Charles H. Mayo: A Consideration of Gastric and Duodenal Ulcer.  
Section of Obstetrics: Thurs., 8 p.m., Annual General Meeting (adjourned from previous date) owed by Ordinary Meeting. It: Placenta Praevia treated by L. Fitzwilliams: Curiosities.  
Section of (Madrid) Frl., 9.30 a.m., Dr. Tapia followed as an Accident in Laryngectomy; and Mr. Lionel Colledge, Professor of Surgery. Demonstration by Mr. Colledge (with exhibition of patients); Mr. Larynx (with exhibition of patients); Dr. Ch. An Artificial Larynx. Papers:—Dr. Ch. for Diseases of the Pharynx, Larynx, (Hall): Tracheotomy in Tuberculosis. Dr. A. Logan, the Social... of Infection. Kinematograph Film:—Dr. Colledge: Restoration of Movement in Vocal Cord after Nerve Anastomosis. Papers:—Dr. J. S. Fraser: Intracranial Dacryocystotomy; Dr. A. Lowndes Yates: The Sinus Condition in Encephalitis Lethargica; 3 p.m., Cases and Specimens.  
Section of Otolaryngology: Sat., 9.45 a.m., Cases; 10.30 a.m., General Discussions: Methods of Drainage of Brain Abscesses; Artificial Aids to Hearing.

### British Medical Association.

#### CURRENT NOTES.

##### Annual Meeting, Bath: Ladies' Sports.

THE time for the Annual Meeting approaches and those who are responsible for the arrangements for the comfort and convenience of members and the ladies accompanying them are anxious to have information which will enable them to satisfy everybody. As notified in our issue of April 4th, ladies accompanying members and lady members of the Association are to be made honorary members of the local golf and tennis clubs, and it will greatly assist in the arranging of matches and competitions if intending players will send their names in advance to Mrs. Doveton, 16, Queen Square, Bath, who is Chairman of the Ladies' Sports Subcommittee.

##### Flags for the Great Hall.

To the list of those areas in which Annual Meetings of the British Medical Association have been held which have promised to contribute a flag for the Great Hall of the new House of the Association must now be added Birmingham, Glasgow, Nottingham, and Worcester. The profession in those places where Annual Meetings have been held, but who have not yet intimated that they propose to have their flag in the Great Hall on July 13th, should note that the time for decision and for the supply of the flag grows very short.

##### Agricultural Scholarships in Australia for Relatives of Members.

Among those successful at the recent draw among the members of the Fellowship of the British Empire Exhibition in the first series of agricultural scholarships for New South Wales are Mrs. C. Paterson, the wife of Dr. William Paterson, the Honorary Secretary of the Willesden Division, and Dr. A. Baldie of the Kensington Division. Both of these winners have generously asked the Association to help them respectively to choose for nomination to the scholarships a boy who is the relative of a member of the Association. Mrs. Paterson simply stipulates that candidates in respect of her nomination must be relatives of members, and Dr. Baldie that candidates for his nomination must be relatives of deceased members of the Association. The Medical Secretary will accordingly be glad to receive from any member the name of a lad (aged from 15 to 17½) who is of good character and physique, with a view to his possible nomination for a scholarship at an agricultural college in New South Wales. Candidates to be accepted will have to pass the tests of the Australian Government. Full information as to the tests is not yet available, but the following will apply: (1) The lad nominated will have to come up for approval by the Central Committee of the Fellowship of the British Empire Exhibition, and pass the medical tests imposed by the Australian Government. (2) On the nominee passing the tests, he will be given a free

passage to Australia and one year's training at an agricultural college there, and afterwards be placed in suitable employment on the land, with a view to his acquiring ultimately a farm of his own. The scholarship thus represents a good start in life for a suitable boy. (3) The candidate must be someone whose folk are well known to the member of the Association suggesting him, and for whose good character the member can personally vouch. On the actual nominee coming up before the Committee of the Fellowship testimonials as to general character will be required. Any member of the Association desiring to suggest a candidate as above for nomination will, on writing to the Medical Secretary, have fuller particulars as soon as these are available.

### Meetings of Branches and Divisions.

#### YORKSHIRE BRANCH: SHEFFIELD DIVISION.

##### Presentation to Dr. Henry Brown.

THE Sheffield Division of the British Medical Association has had the good fortune during the last eight years of having the duties of its secretary entrusted to the very capable hands of Dr. Henry Brown. Thanks to his enthusiastic and methodical labours the membership of the Division has grown considerably, and the interest taken by members in its affairs has become keener and more widespread. The eight successive chairmen under whom Dr. Brown has held office felt that the time had come for some suitable recognition of his services. At the instance of Mr. A. Garrick Wilson, the retiring chairman, they formed themselves into a committee for giving effect to this desire. The proposal met at once with a very ready response in the Division. The presentation was arranged to take place on the occasion of their annual meeting, on May 15th, and attracted an unusually large attendance. Mr. A. GARRICK WILSON, F.R.C.S., in making the presentation, said that during his year of office as chairman, which he had just completed, he had seen a good deal of the work that fell upon their secretary, and had been astounded to find how constant were the demands made upon his time, scarcely a day passing without some business calling for his attention. The Sheffield Division was, he believed, accounted at the headquarters of the Association as one of the most prosperous and enterprising, and such success depended on a secretary willing to give time and labour to the work of the Division. If a Division was well organized on business lines it would attract men and make them more willing to attend meetings. The growth of the Sheffield Division and the better attendance at committee meetings were evidence that they had a secretary who was at pains to make himself *au fait* with all that was going on in the Division, and it was only by long service that knowledge of the inner working of the Association could be gained. No man could have done this work without a good deal of forbearance and support from his wife, who, in addition to other concessions, submitted to having her house made use of on various occasions by different subcommittees! Mr. Wilson read a letter received from the Medical Secretary, Dr. Cox, speaking of Mr. Brown as one of the best Divisional secretaries in his experience. The presentation took the form of a gold watch and chain, a desk, and also a handsome silver tray for Mrs. Brown. Dr. Brown, in responding, said he considered it an honour to hold any office

in the British Medical Association, and any sacrifice of time and labour had been very willingly made. Others on the executive had served the interests of the Division for many years, and he felt he had not deserved to be singled out for recognition. He appreciated more than the gifts themselves the generous spirit of which they were the expression.

The annual meeting of the Sheffield Division was held on May 15th, when the following were elected officers for the year 1925-26:

*Chairman*, Dr. A. C. Turner, D.S.O. *Vice-Chairman*, Dr. C. W. Smith, O.B.E., F.R.C.S.E. *Honorary Secretary*, Dr. H. Brown. *Representatives in Representative Body*, Mr. H. Gaiger, F.R.C.S., and Dr. C. W. Smith. *Deputy Representative*, Dr. W. H. Helm.

The report of the Executive Committee stated that during the past year nine general meetings had been held, with an average attendance of forty-four. There had also been a joint meeting with the legal profession, at which an interesting debate on professional secrecy took place. Dr. LANGDON-DOWNS, chairman of the Central Ethical Committee, being the principal speaker. An important step had been taken in the setting up of a Local Medical Advisory Committee, which was a permanent body, representative of every branch of the profession in Sheffield. A subcommittee had been formed to investigate the after-effects of the recent epidemic of encephalitis lethargica. It was known that the co-operation of this new committee would be welcomed by the local health authority.

Mr. GAIGER, in moving a vote of thanks to the retiring chairman, Mr. Garrick Wilson, for his services during the past year, said that the Division was deeply indebted to him for his able guidance during an unusually heavy year, and one in which some difficult problems had had to be faced. The motion was seconded by Dr. FORREST, and most cordially passed, after which Mr. Garrick Wilson briefly responded.

#### BIRMINGHAM BRANCH: NUNEATON AND TAMWORTH DIVISION.

A very successful meeting of the Nuneaton and Tamworth Division was held at the Warwickshire King Edward VII Memorial Sanatorium on May 13th. After the members had been conducted round the sanatorium a paper was read by Dr. McNair on the treatment of phthisis, with special reference to the induction of artificial pneumothorax. The paper was illustrated by x-ray photographs, and the apparatus was demonstrated.

The meeting elected Dr. D. McColl as Representative and Dr. W. Lawson as Deputy Representative in the Representative Body for 1925-26. After the meeting the members were entertained to tea by the matron.

#### GLASGOW AND WEST OF SCOTLAND BRANCH: GLASGOW NORTH-WESTERN DIVISION.

The annual meeting of the Glasgow North-Western Division was held on May 5th, when the Vice-Chairman, Dr. R. M. BUCHANAN, presided. Before proceeding with the business of the meeting, Dr. Buchanan made a brief and fitting reference to the death of the late Chairman of the Division, Dr. J. McGregor-Robertson. It was decided unanimously to record in the minutes the deep sense of loss felt by all members of the Division as expressed in a letter of sympathy which had been sent to Mrs. McGregor-Robertson.

The following office-bearers were elected:  
*Chairman*, Dr. R. M. Buchanan. *Vice-Chairman*, Dr. E. J. Primrose. *Secretary*, Mr. Mathew White. *Representative in Representative Body*, Dr. R. M. Buchanan and Dr. E. J. Primrose. *Deputy Representative*, Dr. J. G. McCutcheon and Dr. W. R. Sadgrass.

Among other business the Annual Report of the Council was discussed, in particular paragraphs 39, 128, 185, but no formal recommendations were made.

#### KENT BRANCH.

The Annual Report of the Council states that at the end of 1924 the membership of the Branch was 431, compared with 396 in the previous year. The Council has met four times, with an average attendance of over tea. The presence of members co-opted from the Local Medical and Paediatric Committee and from the Society of Medical Officers of Health is appreciated by the Branch Council, and their views are of value in the varied matters which come before the Council. Four meetings of the Branch have been held, at which:  
1. The medical service.  
2. Rheumatism and the cat research and the right.  
3. Neurasthenia, by Dr. T. A. Ross.  
The average attendance has been over thirty. The President entertained forty members to lunch at the annual meeting at Maidstone, and thirty were present at the annual dinner. The Tennyson Smith golf challenge cup was won the first year by Dr. Cassells of Maidstone. The financial statement shows a balance in hand of £27 odd.

#### METROPOLITAN COUNTIES BRANCH: CAMBERWELL DIVISION.

A meeting of the Camberwell Division was held at St. Giles's Hospital, Camberwell, on May 20th, when Dr. R. King Brown, Chairman of the Division, presided.

Dr. W. LANGDON BROWN, physician to St. Bartholomew's Hospital, delivered an address on insulin. The lecturer first gave an outline of the history of the discovery of an effective pancreatic extract, and then proceeded to describe the effects and also the known as insulin. The address was listened to with very great interest, and a considerable number of those present took part in the discussion which followed. The meeting closed with a unanimous vote of thanks to the lecturer.

#### METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.

The annual meeting of the Lewisham Division was held on May 19th, when Dr. F. A. BEATTIE occupied the chair.

Dr. JAMES NEAL, of the Medical Defence Union, gave an address entitled: "Some of the medico-legal difficulties of daily practice and how they may be avoided." In the course of this he said that the modern tendency was to blame the doctor if the patient did not recover as quickly as he expected. The public would suffer from this attitude towards the doctors. The first decision of the Harnett case caused many doctors to refuse to certify cases of insanity. Negligence was not legally defined. A doctor should not answer any complaint brought against him until he had consulted a solicitor or his defence society. The Bench was often lenient and tolerant towards the doctor, but the jury might not take the same view. In the present death certificate the doctor certified the cause and not the fact of death. In cases of criminal wounding careful notes should be made and a colleague should be brought into consultation. There was no obligation to provide a précis of the evidence for lawyers.

Drs. BEATTIE, CHABLESLEY, CHASE, and WHITE joined in the discussion. On the motion of Dr. CHABLESLEY, seconded by Dr. CHASE, it was resolved:

That it is advisable that every member of this Division become a member of a medical defence society.

The following officers were elected:

*Chairman*, Dr. R. G. Chase. *Vice-Chairman*, Dr. E. C. Arnold. *Honorary Secretary*, Dr. C. J. B. Buchan.

The Annual Report of the Council was considered and the Representative, Dr. T. E. White, was instructed.

On the motion of Dr. BEATTIE the following resolution was carried:

That the present tendency of the BRITISH MEDICAL JOURNAL is to publish too many technical papers as compared with articles of general practitioner interest.

#### METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

Dr. G. W. R. SKENE presided over a general meeting of the medical men and women in Willesden, held at the Willesden General Hospital on May 21st. It was reported that the Local Medical Advisory Committee during the past two years had advised the Willesden Urban District Council as to a local campaign against venereal diseases; Ministry of Health circular on cancer; question of diagnosis by health visitors; fees payable to doctors attending school children in cases of accident. It had recommended that treatment of children found to be suffering from defective eyesight should only be carried out under the supervision of registered medical practitioners, and that in every case the advice had been accepted and acted upon. The report was approved, and the following were elected to the Advisory Committee for the next three years:

*General Practitioners*, Drs. C. H. Ault, J. W. Brash, W. Lock, H. J. Macgregor, W. Paterson, C. F. T. Scott, W. W. Stocker, F. R. Sturridge, C. de B. Thomson. *Consultant*, Mr. W. M. Dickson. *Whole-time Officers*, Drs. G. F. Buchan and W. E. Turner.

*Clinical Meeting*.—Mr. Mower White then conducted a large party round the wards and showed a number of cases which he demonstrated in an interesting manner, answering numerous questions and listening to comments. After tea had been served in the nurses' home, Dr. SCOTT, in the absence of the Chairman, Dr. Stocker, thanked Mr. Mower White for his instructive demonstration. Mr. F. D. Sauer will conduct the next clinical meeting, which will be held on Thursday, June 18th, at 3 p.m.

#### NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH: FURNESS DIVISION.

The annual meeting of the Furness Division was held at the Masonic Hall, Barrow, on May 13th. The annual report of the executive was read, and the action taken during the year was approved. It was decided to make a levy of 5s. a member this year, and also to apply to the Branch Secretary for further funds.

The following officers were elected:

*Chairman*, Dr. Wilson. *Vice-Chairman*, Dr. Fawcitt. *Representative in Representative Body*, Dr. Wilson.

A vote of thanks to the retiring Chairman was carried unanimously. It was resolved that the Representative should be elected as soon as possible in the year, and that he should retain office for some time.

The Annual Report of Council was dealt with in sections, that on organization being introduced by Dr. LIVINGSTON, medical ethics by Dr. DANIEL, medico-political by Dr. THOMPSON, hospital policy by the CHAIRMAN, public health by Dr. FAWCITT, and the remainder by the SECRETARY.

#### NORTHERN COUNTIES OF SCOTLAND BRANCH: BANFF, ELGIN, AND NAIRN DIVISION.

The annual meeting of the Banff, Elgin, and Nairn Division was held at Gray's Hospital, Elgin, on May 13th, when Dr. J. E. WILSON, Vice-Chairman, presided. The chairman referred to the great loss the Division had sustained in the death of Dr. W. Maasson Fergusson (Banff), Chairman of the Division for 1924, and the Secretary was instructed to forward a letter of condolence to Mrs. Fergusson. The Secretary's report for the year showed a substantial increase in membership. There had been several meetings of the Division, concerning ethical and other matters. In December an annual dinner was instituted, which proved very successful. The financial side was also in a flourishing condition. The report was adopted.

The office-bearers for 1925 were then appointed as follows:

*Chairman*, Dr. J. K. Wilson (Naltn). *Vice-Chairman*, Dr. R. Douglas (Eglin). *Secretary*, Dr. G. S. Sowden (Eglin). *Representative in Representative Body*, Dr. D. G. Campbell (Eglin). *Deputy Representative*, Dr. F. McDiarmid (Fochabers).

It was unanimously agreed to combine the autumn meeting of the Division and the annual dinner, the general opinion being that December was an unsuitable month in many ways for the latter function. It was left to Drs. Campbell, Taylor, and Sowden to make the necessary arrangements.

#### SHROPSHIRE AND MID-WALES BRANCH.

The fiftieth annual spring meeting of the Shropshire and Mid-Wales Branch was held at the Royal Salop Infirmary on May 19th, when the President, Mr. C. G. Russ Wood, O.B.E., surgeon to the Shrewsbury Eye, Ear, and Throat Hospital, was in the chair. Dr. J. Wheatley, M.O.H. for the county of Salop, was elected as President for 1925-26. The other office-bearers were unchanged.

The Annual Report of the Council was considered. Dr. Miller, M.O.H. for the county of Radnor, proposed an amendment to Appendix IV in the following terms:

That the minimum commencing salary of county medical officers of health, with a county population not exceeding 50,000, be £800-£900 per annum (and not left blank as at present).

He pointed out that all down the scale county medical officers were at a disadvantage of from £100 to £200 per annum, which he thought unfair and invidious, the work being much more onerous on account of the wide area involved. The amendment was carried *nem. con.*, and Dr. Mackie, the Representative in the Representative Body, was asked to bring the matter up. After further business the meeting listened with the deepest interest to a paper by Dr. R. A. Young, physician to the Middlesex and Brompton Hospitals, on some recent work on the diagnosis and treatment of pulmonary tuberculosis. As regards diagnosis, the speaker was not in favour of any of the tuberculin tests—subcutaneous, cuticular, or ophthalmic—as in his opinion they involved a certain risk. X rays were valuable in showing the extent, but not the activity, of the disease. The complement fixation test was not reliable. The most valuable was the test known as the “sedimentation of the red cells.” The technique was explained. Proceeding to the question of treatment, Dr. Young pointed out that in assessing the value of any new or much vaunted treatment, the very extraordinary influence on improvement brought about by the psychical element had to be considered. He then dealt seriatim with all the newer treatments. He had a very poor opinion of nearly all of them. Tuberculin was of some use in a certain type of case: that variety in which the patient had improved very much up to a certain point and then seemed to stick. By far the most valuable treatment was immobilization by means of artificial pneumothorax, but this should not be done in a very early stage. The speaker uttered a warning note in regard to the present-day knowledge of the treatment of this condition. Although the cause of cancer was yet to seek, would they, if and when it was discovered, be any more successful in curing the condition than they were with phthisis?

A very hearty vote of thanks was accorded to Dr. Young for his excellent paper. At the kind invitation of the President members then took tea.

#### SOUTH-WESTERN BRANCH: PLYMOUTH DIVISION.

At a meeting of the Plymouth Division, held on May 12th, Dr. S. Noy Scott was elected as Representative in the Representative Body.

The Annual Report of Council was considered and Dr. Noy Scott was instructed how to vote on the various recommendations. The discussion on hospital policy was most interesting and showed how the opinion of the Division had changed. The facts that hospitals were now being largely used by people able to pay for attendance, and that there was a growing abuse of the 1d. in the £ hospital scheme, had compelled those who were formerly opposed to any sort of payment to the staff to agree to such payment. As evidence of the abuse of the 1d. in the £ scheme, members were now demanding gratuitous bismuth meals and x-ray examination. It was stated that there was a movement on foot to abolish the Plymouth Public Dispensary and to merge the same into a medical out-patient department of the South Devon and East Cornwall Hospital. It was pointed out that there were at present three paid medical officers of the dispensary, and the proposed amalgamation might result in the abolition of such officers and the consequent large increase of unpaid work by the doctors of Plymouth. A sub-committee was appointed to inquire into the matter and report.

The HONORARY SECRETARY read a report detailing the scale of fees offered by friendly societies for attendance on their juvenile members, and as this scale corresponded very closely with that of the National Deposit Friendly Society it was agreed to.

#### STIRLING BRANCH.

The annual general meeting of the Stirling Branch was held on May 12th at the Stirling District Asylum, Larbert, on the invitation of the superintendent, Dr. Robert Campbell. After the business the members had an opportunity of seeing parts of the asylum and grounds. Dr. CAMPBELL demonstrated several interesting cases, and the new hospital was inspected and much admired. Tea was served during the afternoon.

The meeting, which was well attended, was voted one of the most successful the Branch has held.

The following officers were elected for the ensuing year:

*President*, Dr. John Pearson (Bonnybridge). *Vice-President*, Dr. Robert Campbell (Larbert). *Secretary*, Dr. Dyer (Alloa). *Representative in Representative Body*, Dr. Dyer. *Deputy Representative*, Dr. J. S. Mitchell (Bridge of Allan).

#### SUFFOLK BRANCH.

A MEETING of the Suffolk Branch was held at the Royal Hotel, Lowestoft, on May 13th. The President, Dr. Wood-Hill, entertained twenty members to lunch.

Sir CHARLES GORDON-WATSON, F.R.C.S., gave an able address on some experiences in bone surgery, illustrated with lantern slides.

Mr. JOHN OWEN read a paper entitled “Literature and medicine.” This was the first occasion on which a literary paper had been read, and it was enjoyed by the members and their wives who were present.

Tea was served at the kind invitation of Dr. and Mrs. Boswell.

#### SUSSEX BRANCH: CHICHESTER AND WORTHING AND HORSHAM DIVISIONS.

A COMBINED meeting of the Chichester and Worthing and Horsham Divisions was held at the Worthing Hospital on May 13th, when a lantern lecture was delivered by Dr. J. STANLEY WHITE (London) on gland therapy. The lecture was much enjoyed by the large number of practitioners present, and many questions were asked, and answered by the lecturer. The meeting afterwards adjourned to Warner's Hotel, where dinner was served. Twenty-nine members attended and a pleasant evening was spent.

## Association Notices.

### TABLE OF DATES.

- June 10, Wed. Council Meeting, 429, Strand.
- June 18, Thurs. Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.
- June 27, Sat. Supplementary Report of Council appears in SUPPLEMENT.
- July 3, Fri. Amendments and riders for issue in A.B.M. Agenda must be received by this date.
- July 17, Fri. Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.
- July 18, Sat. Annual Representative Meeting, Bath.
- July 20, Mon. Council, and Annual Representative Meeting, Bath.
- July 21, Tues. Annual Representative Meeting. Annual General Meeting. Bath, President's Address.
- July 22, Wed. Council, Meetings of Sections, Conference of Honorary Secretaries, Bath.
- July 23, Thurs. Meetings of Sections, etc., Bath.
- July 24, Fri. Meetings of Sections, etc., Bath.

ALFRED COX, Medical Secretary.

### BRANCH AND DIVISION MEETINGS TO BE HELD.

**BIRMINGHAM BRANCH: WEST BROMWICH DIVISION.**—The third regular meeting for 1925 of the West Bromwich Division will be held at the District Hospital, West Bromwich, on Tuesday, June 9th, at 2.45 p.m. Agenda: Non-members; ophthalmologists and opticians; fees for medical examination of Territorial recruits; payment of assistants; formation of local Hospitals Committee; election of Deputy Representative to Annual Representative Meeting; social meeting; Annual Report of Council; instruction of Representative to Annual Representative Meeting; exhibition of clinical cases. Tea will be provided.

**BORDER COUNTIES BRANCH.**—A general meeting of the Border Counties Branch will be held at the Infirmary, Workington, to-day (Friday, June 5th), at 3.15 p.m. The Branch Council will meet at 3. Agenda: A British Medical Association Lecture—Gastro-intestinal disturbances in infants and young children—will be given by Dr. Hugh T. Ashby. Tea by kind invitation of Dr. J. H. Dudgeon.

**CAPE OF GOOD HOPE (WESTERN) BRANCH.**—A meeting of the Cape of Good Hope (Western) Branch will be held on Friday, June 26th, at 8 p.m. Papers:—Professor W. Campbell: Therapeutic immunization—specific and non-specific; Mr. R. L. Scott: Intrinsic cancer of the larynx; Dr. Royden Muir: Anaesthesia from the patient's point of view.

**EDINBURGH BRANCH.**—The annual meeting of the Edinburgh Branch will be held at Craig House, 153, Morningside Drive, Edinburgh, on Wednesday, June 17th. At 12.30 p.m. luncheon will be served in the Club House, Mortonhall Golf Course, for those playing in the competition; 1.30 p.m., annual golf competition; 4.15 to 5 p.m., tea provided by the President-Elect at Craig House; 5 p.m., business meeting. Members wishing to have lunch at the Club House and to take part in the golf competition are requested to notify the honorary secretary at their earliest convenience. The agenda of the business meeting includes: Report of Branch Council; treasurer's business and annual report; election of office-bearers; presentation of prizes for golf competition; report of election of representative for 1925-26 for the Edinburgh and Fife Branches to the Central Council; election of Branch representative on Queen Mary Nursing Home; proposed addition to Branch rules; recommendation to hold the Annual Meeting of the Association in Edinburgh in 1927; proceedings of Scottish Committee; correspondence; Annual Report of Central Council and Annual Representative Meeting.

**KENT BRANCH.**—The twelfth annual meeting of the Kent Branch will be held on Thursday, June 11th, at Chatham. The President-elect, Dr. A. W. G. Woodforde, kindly invites members and their wives to luncheon at 1.30 p.m. at the Tea Table Café, 79, High Street, Rochester (opposite Cathedral). The annual meeting will be held at 3 in the Naval Hospital, Chatham, by kind invitation of Surgeon Rear-Admiral C. Marsh Beadnell, C.B., R.N., and Surgeon Captain R. J. MacKeown, O.B.E., R.N. Agenda: Receive report of election of new officers, who thereupon take office; and Surgeon statement; appointment of auditor. President's inaugural address: Hypertrophy of the prostate gland. Members and guests are invited to tea and to inspect the Naval Hospital. During the day the competition will be carried through for the Tennyson Smith golf challenge cup. Intending competitors should at once send in their names, addresses, and handicaps to Dr. J. G. C. Taunton, 54, New Road Avenue, Chatham, who will give all necessary information. At 6.30 the annual dinner will be held at the Hotel, Chatham (tickets, 7s. 6d. each; wines and smokes will be kindly provided by the Rochester, Chatham, and Gillingham Division). The golf cup will be presented to the winner at the dinner, and the local Division will present a replica as a memento.

**LANCASHIRE AND CHESHIRE BRANCH.**—The eighty-ninth annual meeting of the Lancashire and Cheshire Branch will be held at the Music Room, Werneth Park, Oldham, on Thursday, June 18th. Members will lunch in the Music Room from 12.30 to 1.15 p.m. by the President, Dr. W. Hirst Bateman, J.P. Agenda: Report of Branch Council and financial statement; the chairman will introduce the new President, Dr. Thomas Fawcitt, who will deliver his presidential address, entitled "Conditions affecting health"; election of officers and two auditors; vote of thanks to retiring officers and Branch Council; place of next meeting. *Visits and Excursions.* Fawcitt will give a prize for the best net return for eighteen holes; visit to the works of Platt Bros., textile engineers; visit to the cotton mills of Wye Mill, Ltd., Shaw. High tea will be served in the Music Room, Werneth Park, from 5.30 to 7 p.m. To facilitate arrangements for lunch and tea and for the various visits and excursions, members intending to be present are requested to inform the honorary secretary, Oldham Division, Dr. C. B. Gerrard, 1, Clegg Street, Oldham.

**LANCASHIRE AND CHESHIRE BRANCH: HYDE DIVISION.**—The annual meeting of the Hyde Division will be held at the Hyde Town Hall on Thursday, June 11th.

**METROPOLITAN COUNTIES BRANCH.**—The annual general meeting of the Metropolitan Counties Branch will be held at the British Medical Association House, Tavistock Square, W.C.1, on Tuesday, June 23rd, at 4 p.m. Business: (1) Report of scrutineer on election of officers; (2) Annual Report of Council; (3) Report of Representatives of the Branch on the Central Council; (4) President's address, by Mr. Comyns Berkeley.

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.**—A meeting of the Lewisham Division will be held at St. John's Hospital, Lewisham, on Tuesday, June 16th, at 8.45 p.m., with Dr. R. G. Chase in the chair. Dr. Offenheim will give an address.

**METROPOLITAN COUNTIES BRANCH: ST. PANCRAS DIVISION.**—A meeting of the members of the British Medical Association and other practitioners residing within the area of St. Pancras will be held at the Midland Hotel, St. Pancras, N.W., to-day (Friday, June 5th), at 4.30 p.m. precisely, to consider the reorganization of this Division. Agenda: (1) To elect a chairman of the meeting. (2) It will be proposed: "That this meeting approves of the reorganization of the St. Pancras Division of the British Medical Association." (3) The following officers will be elected: (a) Chairman of the Division; (b) Vice-Chairman of the Division; (c) Honorary Secretary and Treasurer; (d) Representative on Representative Body; (e) Representative on Branch Council; (f) Members of the Executive Committee. (4) Such other matters as may arise. (5) It will be further proposed: "That a copy of the resolutions passed at the meeting be sent to the Metropolitan Branch Hospital." (6) It will be made them effective as early as possible." Council with a request to make them effective as early as possible.

**METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISION.**—The next meeting of the Westminster and Holborn Division will be held on Thursday, June 11th, at 8 p.m., at the Clinic, 86, Brook Street, W.1. A good attendance is hoped for.

**SOUTH WALES AND MONMOUTHSHIRE BRANCH: NORTH GLAMORGAN AND BRECKNOCK DIVISION.**—The annual meeting of the North Glamorgan and Brecknock Division will take place at the General Hospital, Merthyr, on Thursday, June 11th, at 2.30 p.m., and will be of a social nature. After the business is disposed of, and by the kindness of Mr. Howell Jones, J.P., members and lady friends are invited to Gwaloddygarth for tea and tennis from 3.30 to 6.30 p.m.

**SOUTHERN BRANCH.**—The fifty-second annual meeting of the Southern Branch will be held at Bree's Royal Hotel, Jersey, on Thursday, June 11th, at 2.45 p.m., when the President, Dr. Henry Devine, O.B.E., will take the chair. Agenda: Annual report of Branch Council; financial statement for 1924-25; election of officers; vote of thanks to the retiring President. At the conclusion of the above business, Dr. Henry Devine will vacate the chair in favour of Lieut.-Colonel P. M. Bentliff, M.B.E., who will deliver an address entitled "Reminiscences."

**SUFFOLK BRANCH: WEST SUFFOLK DIVISION.**—A meeting of the West Suffolk Division will be held on Tuesday, June 23rd, for the consideration of the Annual Report of Council, which will be presented as follows:—Dr. O. R. M. Wood: Preliminary, finance, organization, *BRITISH MEDICAL JOURNAL*; Dr. G. H. Metcalfe: Science, medical ethics; Dr. E. E. A. Batt: Medico-political, Parliamentary elections; Dr. Grace Griffith: National health insurance.

non-panel, public health and Poor Law, hospitals, naval and military. A combined clinical and social meeting of the Division will take place on Thursday, August 6th, when Dr. Wood has very kindly offered to entertain the Division once more at Woolpit. Tea in his garden will follow a clinical meeting at the Institute.

**SURREY BRANCH.**—The annual meeting of the Surrey Branch will be held in the Guildhall, Guildford (by kind permission of the Mayor of Guildford), on Wednesday, June 24th, at 1.45 p.m. Agenda: To receive (a) report of the election of new officers, who shall thereupon take office; (b) report of the Branch Council and the annual financial statement. Address by the President, Mr. H. Branson Butler, F.R.C.S.E. The Guildford Division invites members to lunch at the Angel Hotel, Guildford, at 1 p.m. After the annual meeting members will proceed by car to Alton, where Sir Henry Gauvain has invited them to tea at his private clinic at 3.30. Sir Henry Gauvain will afterwards conduct the party over Lord Mayor Treloar Cripples' Hospital (by permission of the Governors). The annual Branch dinner will be held at the Angel Hotel, Guildford, at 7 p.m. (tickets 7s. 6d., exclusive of wine). It is hoped that as many members as possible will stay to the dinner.

**WORCESTER AND HEREFORD BRANCH: HEREFORD DIVISION.**—The annual meeting of the Hereford Division will be held on Monday, June 8th, at 20, East Street, Hereford, at 2.30 p.m. Agenda: Election of officers; consideration of Annual Report of Council, and instructions to Representative (members are asked to bring to the meeting the *SUPPLEMENTS* of April 11th and 18th); mileage fees in emergency midwifery cases; school medical officers.

**YORKSHIRE BRANCH: HUDDERSFIELD DIVISION.**—The annual picnic arranged by the Huddersfield Division will take place on Wednesday, June 10th. The charabanc will leave York Place at 12.45 p.m. for Skipton and Burnsall. Afternoon tea will be served at the Red Lion Hotel at Burnsall, about 3.30. About 4.15 the charabanc will proceed to the Strid, near Bolton Abbey. Dinner at the Devonshire Arms Hotel, Bolton Abbey, at 6.15.

## GENERAL COUNCIL

### MEDICAL EDUCATION AND REGISTRATION. SUMMER SESSION, 1925.

#### EDUCATION COMMITTEE.

Dr. Mackay, reporting for the Education Committee, stated that the Ministry of Education of Northern Ireland had substituted a senior leaving certificate examination for the former senior grade. The standard of the new examination was higher than that of the former test, as the percentage of marks required for a pass was 40 per cent. instead of 30 per cent. It had been resolved by the Committee to include this examination in the list of recognized preliminary examinations, providing that the subjects now required by the Council were included therein. It had been decided also to accept the preliminary certificate of the Provincial Medical Board of Nova Scotia as exempting the holder from matriculation, providing it was accepted by one of the universities in this country, and a similar decision had been reached with regard to the leaving certificate of the Intermediate Education Board of the Irish Free State.

#### EXAMINATION COMMITTEE.

Sir Norman Walker, in presenting the report of the Examination Committee, said that the number of students was definitely down. This gave an early indication of the likely supply of new entrants to the profession in the next few years. There was evidence of an increasing readiness on the part of most licensing bodies to accept the corresponding examinations of other bodies, so that the student was no longer "thirled" to one particular university as formerly. The English Conjoint Board during 1924 had accepted 179 and the Society of Apothecaries 86 candidates who had passed the first professional examination elsewhere, and the Scottish and Irish Boards gave large numbers of similar exemptions. It was, however, particularly in the universities that this increasing readiness to accept each other's examinations was evident. The Committee hoped to present at the next session a comprehensive report on the examinations in anatomy and physiology.

Sir Arthur Chance said that the question of whether operative surgery should or should not be included in the final examination ought to be definitely determined, also whether, by an examination in operative surgery, no operation on the cadaver or on the living subject was intended. Sir Leslie Mackenzie desired to know how far infectious diseases—the definition of which was widening every day—figured as a subject in the final.

Professor LITTLEJOHN said that the Council on a former occasion had unanimously recommended the desirability of forensic medicine having a place in the final, but in many bodies this recommendation appeared to have no effect. He promised to raise the matter more appropriately on a subsequent occasion.

The Council resolved:

That the bodies be requested to supply information as to the means adopted to ensure that each candidate for the final examination has an adequate knowledge of operative surgery, ophthalmic surgery or ophthalmology, and mental diseases.

#### PUBLIC HEALTH COMMITTEE.

Sir JOHN MOORE, for the Public Health Committee, reported that, during 1924, 465 candidates presented themselves for the first examination for the Diploma in Public Health, of whom 319, or 68.6 per cent., passed. For the second and final examination 406 candidates presented themselves, of whom 312, or 76.85 per cent., passed. The Committee found itself unable to grant some concessions suggested by the University of Liverpool, that a sanitary staff officer of the R.A.M.C. might be allowed to give the certificate in public health administration required by the old rules so far as venereal diseases, inspection and control of food, and inspection of premises were concerned, and that a medical officer of health might be given discretionary powers to accept such certificates from army candidates. The University of Toronto had asked to have its D.P.H. recognized, but had been informed that this recognition could not be granted owing to the provisions of Section 21 of the Medical Act, 1886, which refers only to licensing bodies in the United Kingdom. The University of Lucknow asked that it might be recommended to the examining bodies that they should grant exemption to candidates who had successfully completed training at that university in one or more subjects for the D.P.H. The Public Health Committee replied that the Council could not delegate to any licensing body the power of granting such general exemptions.

Sir JOHN MOORE added that the Society of Medical Officers of Health had drawn attention to the working so far of the new rules and regulations with regard to the D.P.H. A good deal of criticism had been directed to these rules. He feared that the number of applicants for the diploma was likely to diminish. Some of the licensing bodies seemed to find it hard to carry on the curriculum under the new conditions, and the history of these new rules and regulations would have to be watched very carefully.

#### FINANCE COMMITTEE.

Sir HOLBURN WARING submitted the Finance Report of the Council. The income of the General and Branch Councils for 1924 was £18,848, and the expenditure £11,664. The income had gradually risen since 1918, when it stood at £7,473, and the expenditure, which in that year was £7,132, had risen in a smaller ratio. During the present century the number of names on the *Medical Register* had increased from 36,912 to 49,958. The public would probably suffer no detriment if for some time to come the increase was less rapid, and time was given for the full absorption into practice of those whose names were now being added to the *Register*. The number of students registered in recent years had been as follows:

1919	...	3,420	1922	...	1,833
1920	...	2,531	1923	...	545
1921	...	1,808	1924	...	1,043

These figures gave some indication of the income from medical registration fees which might be expected during the next few years.

#### COMMITTEES.

In the course of the session the following Committees were elected:

*Business Committee.*—Sir Norman Walker (Chairman), Sir Francis Champneys, Dr. J. A. Macdonald, Dr. Magennis, the President (*ex officio*).

*Dental Education and Examination Committee.*—Sir James Hodson (Chairman), Mr. Ackland, Mr. Dolamore, Sir Holburt Waring, Mr. Guy, Mr. Sinclair, the President (*ex officio*).

*Finance Committee.*—Sir Holburt Waring (Chairman), Sir George Newman, Sir James Hodson, Sir Arthur Chance, the President (*ex officio*).

*Pharmacopœia Committee.*—The President (Chairman), Dr. Inman, Dr. Caton, Sir Humphry Rolleston, Sir Nestor Tirard, Sir Holburt Waring, Dr. Wild, Dr. Adams, Dr. Mackintosh, Sir Norman Walker, Dr. Kidd, Dr. Magennis, Sir J. Moore.

*Education Committee.*—Dr. Brackenbury, Sir Francis Champneys, Dr. Griffith, Mr. Leathes, Sir George Newman, Sir Humphry Rolleston, Sir James Hodson, Mr. Littlejohn, Dr. Mackay, Dr. Dixon, Dr. Kidd, Mr. Sinclair.

*Examination Committee.*—Sir Gilbert Barling, Dr. Bolam, Dr. Duckworth, Mr. Eason, Sir Holburt Waring, Dr. Wild, Dr. Mackintosh, Dr. Russell, Sir Norman Walker, Sir E. Coey Bigger, Sir Arthur Chance, Dr. Coffey.

*Public Health Committee.*—Mr. Eason, Mr. Leathes, Sir George Newman, Mr. Osborn, Mr. Thomson, Sir Jenner Verrall, Dr. Adams, Mr. Littlejohn, Sir L. Mackenzie, Sir E. Coey Bigger, Dr. Magennis, Sir John Moore.

*Executive Committee.*—Sir Gilbert Barling, Dr. Macdonald, Sir George Newman, Sir Humphry Rolleston, Sir Jenner Verrall, Sir Holburt Waring, Sir James Hodson, Sir L. Mackenzie, Sir Norman Walker, Sir E. Coey Bigger, Sir Arthur Chance, Sir John Moore.

*Dental Executive Committee.*—The above with Mr. Dolamore.

#### DISCIPLINARY CASES.

##### Cases coming up for Judgement.

The first disciplinary business before the General Medical Council consisted of five cases in which certain facts had been proved against practitioners at previous sessions but the Council had not proceeded to judgement.

The first was the case of Dr. Sridhar Bheekajee Gadgil, registered as c/o the National Bank of India, Fort, Bombay, who had been convicted at the Marlborough Street police court in 1923 of a misdemeanour—namely, insulting behaviour (SUPPLEMENT, June 7th, 1924, p. 272). Dr. Gadgil, who was not able to be present at the previous hearing, now appeared, with Mr. Oswald Hempton, his solicitor. Mr. Hempton said that before the hearing of the case by the Council in May, 1924, and indeed before a notice could be served upon him, Dr. Gadgil had resigned an appointment he held at Islington Infirmary and had sailed for India. The Council had required that he should appear in person at the present session, and he had thrown up his practice in India and returned to face the charge. He admitted the conviction, though he denied its justice. The conviction was arrived at on the uncorroborated word of a police constable. He did not appeal against it, as he might have done, but left the country for reasons entirely unconnected with the conviction. He now put in a number of testimonials, including one signed by seventeen of his colleagues in India, and another by the late matron and late assistant matron at Islington Infirmary.

The Council, after a brief deliberation, did not see fit to direct the Registrar to erase Dr. Gadgil's name.

The next case was that of Dr. J. J. Brennan and Dr. V. T. P. Webster, both registered as of Merthyr Tydvil, against both of whom a charge of lax certification had been proved (SUPPLEMENT, December 13th, 1924, p. 220). Testimonials from medical colleagues in their neighbourhood were put in on behalf of both practitioners, and the Council, again after a brief deliberation, did not see fit to erase either name.

The case of Dr. Henry Love, registered as of Avoca, Mitcham, Surrey, came next. It had been proved against Dr. Love that he had "covered" uncertified midwives (SUPPLEMENT, June 7th, 1924, p. 272). Dr. Cates, on behalf of the Surrey County Council, the complainants, said that the Council offered no further evidence. Careful inquiries had been made into the character of the defendant's practice in respect of midwives during the period since the hearing, and no irregularity had been discovered. Dr. Love put in certain testimonials from fellow practitioners, and repeated that he had not the smallest idea at the time that he was committing any offence; his object had simply been to provide some midwifery service among poor people in a district where certified midwives were very few.

The PRESIDENT announced the decision of the Council:

"... in the hope that you may at length be made aware of the fact that you must not, in breach of the law, by your countenance or assistance, enable uncertified women to practise as midwives, they do not see fit to direct the Registrar to erase your name from the *Medical Register*."

A similar charge of "covering," relating, however, only to one woman, had been proved against Dr. Henry Spencer Hughes, registered as of Galen House, Lozells Road, Birmingham (SUPPLEMENT, June 7th, 1924, p. 273). The Public Health Committee of the Birmingham City Council, which had made the complaint, stated that it had no further evidence to offer; and, certain testimonials having been put in, the President stated that the Council thought they might assume that the defendant now fully appreciated the grave responsibility that a practitioner assumed when he undertook, under cover of his qualifications, to further the illegal practice of midwifery by uncertified women, and they did not see fit to direct the Registrar to erase his name.

(To be continued.)

## National Insurance.

## Correspondence.

[SUPPLEMENT TO THE  
BRITISH MEDICAL JOURNAL]

## THE ROYAL COMMISSION.

THE thirtieth meeting of the Royal Commission on National Health Insurance was held at the Home Office, Whitehall, on May 28th, Lord Lawrence of Kingsgate in the chair. Evidence as to the possibilities of assistance to the hospitals from the insurance scheme was given by the British Hospitals Association, represented by Mr. H. Wade Deacon, the Viscount Hambleden, and Mr. J. Courtney Buchanan; by the Middlesex Hospital, represented by Mr. A. E. Webb-Johnson and Mr. Walter Kewley; and by the Sheffield Joint Hospitals Council, represented by Sir Henry Hadow and Mr. S. R. Lamb. Thereafter, Mr. Owen Aves, Mr. Francis Gregg, and Dr. James Forrest, representing the Institute of Ophthalmic Opticians, were examined on the nature, extent, and cost of optical and ophthalmic treatment of insured persons.

Proof copies of the oral evidence and the relative statements submitted at the meeting of May 14th may be obtained from H.M. Stationery Office, Adastral House, Kingsway, W.C.2, on remittance of cost (2s. 3d.) and postage.

## Correspondence.

*Midwifery Work in General Practice.*

SIR,—After reading in the SUPPLEMENT of May 23rd the medical evidence so admirably given before the Royal Commission on National Health Insurance, a point occurred to me worth mentioning. After thirty years of midwifery I gave it up, mainly because of the anxiety day by day. Often one was either occupied in the surgery when one ought to have been at a midwifery case, or at the midwifery case while a crowd was collecting at the surgery. A locumtenent once asked me, "Shall I go to a confinement or attend patients at the consulting room?" From the patient's point of view, as from one's own, it is obvious that it is better for a doctor to concentrate on one job without distraction of mind.—I am, etc.,  
London, S.E., May 23rd.  
W. C. JARVIS.

*The Liberties of the Profession and the Annual Representative Meeting.*

SIR,—It is not surprising that a committee who did not believe in their own arguments were unsuccessful in convincing members of Parliament. I wonder if they pointed out the fact that the power to remove from the panel was committed by Parliament only to a carefully balanced body, of which the deputy chairman was a medical man, and had devolved by accident upon a single lay Minister who may be frankly hostile to the medical profession. Again, it was doubtless never mentioned that the power to fine, also committed to the same body, depended upon serious financial miscalculations in the original Act, which would have been impossible had the same pains been taken to consult us beforehand as were taken to consult "societies" and trade unions. Finally, did they show how "society" officers, who need disciplinary correction far more than doctors, escape entirely?

Again, does Dr. Brackenbury believe that members of Parliament will be more willing to curtail the powers of a lay Cabinet Minister by means of a purely professional committee, such as he now proposes, than by means of the High Court of Appeal? Personally I think that, if once the principle of appeal is conceded, it is far more likely that appeal will be allowed to the High Court; and further, if this is done, the logical and simple plan will be to allow appeal against injustice of any kind. Such policy will be much more intelligible to the laity than limitation to the mere amount of a fine, which they will not understand. Clearly a doctor, especially a newcomer, may be more effectually ruined by aspersions upon his professional capacity and conduct than by a fine, which may nevertheless be out of proportion to his offence.

At present appeal is allowed only against alleged illegality in the action of the Minister. Such appeals are made, I believe, to a court competent to deal with such technical matters, and invariably fail, as naturally the Minister is careful not to commit illegality, however grave his injustice. What we want is appeal to the High Court against injustice in any form. So formidable a procedure will be undertaken only on the rarest occasions, and upon serious matters of principle. The privilege is not more likely to be abused by the laity than by ourselves, and we need not grudge it to them.

I certainly approve of the efforts made in the Memorandum of Evidence to weed out minor complaints, and do not wish to interposition of a purely professional committee in the doubt its acceptability by Parliament. What many of us desire, and what Cheshire, I believe, desires, is that in all cases which, even under the policy of the Memorandum, will

come to decision by the Minister, appeal to the High Court shall be legitimate on any grounds involving injustice to the profession.

I therefore suggest, in order to ensure discussion, the following resolution for the Annual Representative Meeting:

That it be an instruction to the Council that, when consulting the Divisions as regards any suggested amendments of or additions to the policy of the Association in reference to the National Health Insurance Acts, or extensions of the same, they include for consideration the following—namely, "That, in addition to the right now enjoyed of appeal to the courts on the ground of improper procedure, appeal to the High Court shall be legitimate against any penalty, other than removal from the panel, imposed upon a practitioner by the Minister."

The recent articles in the *Times* and *Law Journal* should assist in opening the eyes of the public, and the presentation to Parliament of their report by the Royal Commission should give us an opportunity to present our case.

I take strong exception to the recommendation of the Council in respect to Minute 185 of the Annual Representative Meeting. They overlook entirely the origin of the resolution passed by the Representative Body which, as clearly indicated by its mover, marked grave disapproval of the action of a single Medical Council in a recent case. The addition of a single direct representative could not possibly lead to any of those alarming results conjured up by the Council in their efforts to stampede the Representative Body and whitewash the General Medical Council. Such addition would, however, most suitably and permanently mark the opinion of the Representative Body of the arbitrary and high-handed action of the General Medical Council, and I sincerely hope that the Representative Body will maintain the extremely reasonable and timely resolution which it passed, and that all Divisions will instruct their representatives accordingly. If one such addition be made whenever the General Medical Council offends in this fashion it will perhaps be brought home to that body that, whereas it may not be their duty to assist in any manner the hard-working general practitioner, it is in no way their business to persecute him.—I am, etc.,  
Chichester, May 24th.

G. C. GARRATT.

*Direct Representation on the General Medical Council.\**

SIR,—May I urge the forthcoming Representative Meeting of the British Medical Association to support the amendment by the Willesden Division (SUPPLEMENT, May 16th, p. 204)? The representation on the General Medical Council under the Medical Acts of 1858 and 1886 is unjust to the rank and file of the general practitioners.

There are on the Council forty-one members, and of these only six are elected as direct representatives of the medical profession in Great Britain and Ireland—namely, England and Wales 28,642 electors, Scotland 5,635, Ireland 3,964; total 38,101. The intention of the Medical Act of 1886 was evidently that, as the Council was a judicial body, it was only fair that medical men brought before the Council for "infamous conduct" should be judged by their peers. Before 1906 the six direct representatives were nominated and elected by the free and independent electors. In 1906 the six for England and one each for Scotland and Ireland, at the last election there was no contest in Scotland or in Ireland; in England there were seven nominated to oppose the four nominated by the British Medical Association, and the result proved up to the hilt my forecast. Having contested two elections I am convinced that the policy of the British Medical Association is contrary to the purpose and spirit of the 1886 Medical Act. Also I believe that the Association would act wisely if the Council would in the future use its splendid organization and authorize each Division to call a meeting of all doctors, members and non-members, to secure the best candidates for nomination. I am sure that the Association would secure its fair proportion of successful candidates.

Since 1886 the universities and colleges have been increased from 20 to 27, but direct representatives have remained at 6. Since 1886 the medical electorate has increased from 19,350 to over 38,000. No arguments are needed to prove the justice of an increase of direct representatives. I do not advise an increase of direct representatives. I suggest that the direct representatives should be reduced to 15, and that these should be based upon proportional representation. I suggest that the direct representatives should be increased to 15, that they should be elected upon the same principle, and that the constituency for these should be divided into separate areas so that the expenses of elections of candidates should not be too costly. In this way there would be three for Scotland in three definite areas, three for Ireland, and nine for England and Wales. The areas and the number of electors to each would be fairly just.

\* BRITISH MEDICAL JOURNAL SUPPLEMENT, April 11th, 1925, p. 154, para. 109.  
\* Ibid., August 2nd, 1924, p. 77.  
\* Abridged.

At the meeting of the Blackpool Division held on May 13th I was able to give statistics which prove that the present system is unjust. I hope to receive further facts before the Representative Meeting at Bath, and will gladly assist the Willesden or any other Division which seeks to give better representation to the great mass of the medical electors.—  
Blackpool, May 18th.

JOHN BROWN, M.D., D.P.H.

## Naval and Military Appointments.

### ROYAL NAVAL MEDICAL SERVICE.

SURGEON COMMANDER H. HUGHES has been placed on the retired list, with the rank of Surgeon Captain.  
President, additional for duty in Medical Department, temporary; F. L. Smith to the *Furious* on commissioning; A. Davidson to the *Columbine* for Port Edgar Base; R. H. Atkins to the *Dread*.  
Surgeon Lieutenant Commander G. E. Heath to the *Hermes* on recon-  
aissance.  
Surgeon Lieutenants E. V. Baraes to the *Sandhurst*; A. de B. Joyce to the *Thunderer*; D. Duncan to the *Cyclamen*.

### ROYAL NAVAL VOLUNTEER RESERVE.

Late temporary Surgeon Lieutenant (R.N.) W. P. Elford has entered as Surgeon Lieutenant, and attached to the Bristol Division.  
E. E. Henderson has entered as Probationary Surgeon Lieutenant and attached to the Scottish Division.  
Probationary Surgeon Sublieutenant L. P. Spero to be Surgeon Sub-  
lieutenant.

### ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel R. N. Hunt, D.S.O., is placed on the half-pay list on account of ill health.  
Major G. P. A. Bracken retires on retired pay.  
Major F. W. W. Dawson to be Lieutenant-Colonel, vice Lieut.-Colonel R. N. Hunt, D.S.O., to half pay.  
Major W. L. Hay to be temporary Captain and relinquishes the rank of Major.  
Captain F. R. S. Shaw, M.C., is seconded for service under the Colonial Office.  
Temporary Captain A. A. Wilson relinquishes his commission on account of ill health, and retains the rank of Captain.

### ROYAL AIR FORCE MEDICAL SERVICE.

Wing Commanders E. C. Clements, O.B.E., and D. Ranken to Specialists' Medical Establishment, for specialist duties with Central Medical Board.  
Flight Lieutenant E. A. Lumley, M.C., is promoted to the rank of Squadron Leader.  
Flight Lieutenants W. Parsons to Central Medical Board; J. Prendergast to No. 100 Squadron, Spitfire.  
The following relinquish their temporary commissions on ceasing to be employed: Flight Lieutenant J. F. Gallagher, Flight Lieutenant (Honorary Squadron Leader) James Craig.  
Flight Officer R. F. Dickson to Research Laboratory and Medical Officers' School of Instruction, Hampstead, on appointment to a short-service commission for short course; C. G. J. Nicholls to No. 13 Squadron, Andover.

### INDIAN MEDICAL SERVICE.

Brevet Major W. Ross Stewart, Staff Surgeon, Bangalore, is appointed, in addition to his own duties, to officiate as an Agency Surgeon.  
Lieut.-Colonel Residency Surgeon, Mysore, during the absence on leave of the previous orders.  
Major J. L. Sen, M.C., M.B., I.M.S., is appointed to act as Superintendent, J-Nay Institute, Delhi.  
The services of Captains W. J. S. Ingram, M.C., and M. Murphy, M.C., are placed temporarily at the disposal of the Government of Burma.

### REGULAR ARMY RESERVE OF OFFICERS.

Colonel H. J. M. Buist, C.B., C.M.G., D.S.O., late R.A.M.C., having attained the age limit of liability to recall, ceases to belong to the Reserve of Officers.  
Captain H. C. Sinderson to be Major, and remains seconded.  
Captain G. F. P. Gibbons, O.B.E., to be Major.

### MILITIA.

### ROYAL ARMY MEDICAL CORPS.

Major G. G. Marshall (late R.A.M.C., S.R.) to be Captain, with precedence as from April 1st, 1915, and relinquishes the rank of Major.  
Captain W. S. Martin, M.C., to be Divisional Adjutant 47th (2nd London) Division and School of Instruction, vice Major W. P. Croker, as from July 19th, 1918.  
Captain H. Forrest to be Major (prov.).  
Captain A. J. Chillingworth (late R.A.M.C.) to be Captain, with precedence as from September 1st, 1919.  
Captain J. Robinson resigns his commission and retains his rank.  
Lieutenant P. M. Speed (late Argyll and Sutherland Highlanders) to be Lieutenant.  
Sanitary Companies.—Captain S. Summerson to command 8th (London) Sanitary Company.

### ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel D. G. Rice-Oxley, M.C., T.D., from active list, to be Lieutenant-Colonel.

STENHOUSE, point of view of the bacteriologist; point of view of the chemist; point of view of the public health officer; point of view of the milk producer; point of view of the milk consumer.

opened by Mr. WILFRED ... as a prod and Mr. ... Two 5hr certified of milk

At 3.45 p.m. motors w where, by invitation of guests will be shown the

The Honorary Local General Secretary for the Annual Meeting is Mr. W. G. MUMFORD, O.B.E., F.R.C.S. (British Medical Association Committee Rooms, Assembly Rooms, Bath); and the Honorary Assistant Secretary is Dr. R. G. GORDON.

**TRAVELLING ARRANGEMENTS.**

To members intending to be present at the Bath Annual Meeting the railway companies have agreed to issue return tickets at the cost of a single fare and a third. The concession applies to all railway companies in Great Britain (but not in Ireland), and the tickets will be available from July 15th to July 27th. They will be issued only upon production of a special voucher signed by the Financial Secretary of the British Medical Association, present address: 429, Strand, W.C.2, to whom application should be made.

For the convenience of members residing within a radius of fifty miles of Bath, the railway companies have undertaken to issue from Bath on presentation at the booking office of the Official Member's Card:

1. Return tickets available for the day of issue or following day, or from Sunday to Monday, at a single fare and a third—minimum 1s. per passenger, fractions of 3d. reckoned as 3d.
2. Season tickets for not less than six days, allowing for more than one journey per day (Sunday being a *dies non*) at a charge not less than the accumulated fares per day (see Clause 1), minimum 1s. per day, fractions of 3d. reckoned as 3d. on each day fare.

The Official Member's Card will be obtainable in the Reception Room at the Banqueting Hall, Guildhall.

Members should use the railway ticket they obtain in exchange for the voucher for the first journey to and the last journey from Bath. For all intermediate journeys the reduced tickets can be obtained by exhibiting the Member's Card to the booking clerk at Bath.

**HOTEL ACCOMMODATION.**

A considerable amount of hotel accommodation is available in Bath. The terms are indicated in the table printed below. It should be noted that the bookings at the Grand Pump Room Hotel and the Empire Hotel for the period of the Annual Meeting are now complete and no further rooms in either of these hotels can be obtained. Members desiring accommodation should write immediately to Dr. R. G. Gordon, British Medical Association Committee Rooms, Assembly Rooms, Bath.

## THE PATHOLOGICAL MUSEUM.

The committee responsible for the organization of the Pathological Museum is anxious to secure the co-operation of the officers of the various scientific Sections at the forthcoming Annual Meeting in Bath of the British Medical Association. The committee will be glad to take charge of, and place in the museum for exhibition, any specimens, casts, photographs, diagrams, or microscopic slides during the time they are not required by those who are reading papers or taking part in the discussions. Every care will be taken of specimens, and the contents of the museum will be insured.

## THE ANNUAL EXHIBITION.

In connexion with the Annual Meeting at Bath, the exhibition of surgical instruments, appliances, x-ray apparatus, drugs, books, foods, etc., will be held in the Market Hall from Tuesday, July 21st, to Friday, July 24th, inclusive.

## ANNUAL DINNER.

The Annual Dinner of the Association will be held at the Assembly Rooms, Bath, on Thursday, July 23rd, at 7 p.m. Full evening dress will be worn, with decorations. The accommodation is limited to 400, including ladies. The price of the dinner ticket is 12s. 6d., exclusive of wine, and £1 1s. with wine. Those intending to be present are requested to address their applications to Mr. A. de V. Blathwayt, 6, Brock Street, Bath.

## GOLF COMPETITIONS AT THE ANNUAL MEETING.

## THREE CUPS FOR COMPETITION.

The British Medical Association holds each year a golf competition wherever the Association happens to be holding its Annual Meeting. In the past members have only had the privilege of playing for two cups—namely, the Ulster Cup, presented to the Association by the Ulster Branch, and first played for during the Annual Meeting at Belfast in 1909, and the Childs Cup, presented by Mr. C. P. Childs at the Annual Meeting at Portsmouth in 1923.

There is now, however, a third cup, called the Treasurer's Cup. Mr. N. Bishop Harman, the Treasurer of the Association, generously presented this to the Council for competition at the December (1924) meeting of the Council.

It will be remembered that the Secretaries' Conference at Bradford approved a proposal for a golf competition to be played during the year throughout the Divisions and Branches of the British Medical Association in England, Ireland, Scotland, and Wales. Below will be found the rules drawn up by the committee appointed at the Conference which govern the competition this year. The cup will, of course, only be held for one year. It must be understood that the rules are for this year only and will be reconsidered in the light of the experience of this year's competition. The competition is in three stages: (1) a knock-out competition in the Divisions (the winners' names were given in the SUPPLEMENT of May 16th), (2) a knock-out competition in the Branches (due to be completed by June 1st), and (3) the final stage, to be played off on Friday, July 24th, during the Annual Meeting of the Association at Bath.

## RULES AND REGULATIONS FOR PLAY.

## The Ulster and Childs Cups.

Both cups will be played for during the same round. The Ulster Cup is open to all members of the Association, the maximum handicap allowed being 18; the Childs Cup is open to all members of the Association who have a handicap of 10 or over, 18 being the maximum again allowed. Play in both cases is against bogey. If the Ulster Cup is won by any competitor with a handicap of 10 or over the Childs Cup will be presented to the player (with a handicap of 10 or over) with the next lowest score.

Conditions of play are as follows:

1. One round of 18 holes to be played on Thursday, July 23rd, by kind invitation of the Bath Golf Club at their course.
2. Competitors are not permitted to put in previous play on the course on the day of the competition.

3. Intending competitors are required to furnish with their entry a certificate signed by their club secretary stating (a) their lowest handicap, (b) the bogey score of their own course, and (c) the length of their own course.

4. Entries to be made at the Reception Room before 6 p.m. on Wednesday, July 22nd.

5. Competitors may choose their own partners, although partners will be arranged for by the committee on notice being given at the time of entry.

6. Play to commence at 9.30 a.m., no cards to be issued after 3.30 p.m.

## Treasurer's Cup.

To be played in three stages. Entrance fee 2s. 6d. Open to all members of the British Medical Association.

**First Stage.**—Entries to be handed in to the Secretary of the local Division by November 15th. Arrangements for the eliminating rounds to be in the hands of a special Golf Subcommittee or, failing this, the Executive of the Division. Competition to be a knock-out competition under handicap rules, members' club handicap to be accepted. Once a handicap has been settled by the Division Executive or Golf Subcommittee no alteration can subsequently be made. Draw to be arranged by the Golf Subcommittee, first round to take place by January 1st. Matches to be played upon ground mutually agreed upon by the players. Failing agreement the matter to be referred to the Golf Subcommittee for decision. Subsequent eliminating rounds to be arranged so that first stage will be completed by March 15th.

**Second Stage.**—Division winners in the area of the Branch to engage in knock-out competition. This stage to be completed by June 1st. Committee in charge—the Branch Council or special Golf Subcommittee appointed; arrangements as in first stage. For the purposes of this competition the Metropolitan Counties Branch Inner and Outer Groups will count as separate Branches.

**Note.**—In some Divisions or Branches it may be convenient to play one or more of the rounds on one day—making a "field-day" for golfing members of the Division or Branch.

**Third Stage.**—The successful forty-four competitors will play off under medal play conditions (handicap) on the Friday (July 24th) during the Annual Meeting of the Association at Bath. Winner to be the one who returns the lowest score under handicap. Arrangements for this stage to be made by the Central Committee appointed by the Secretaries' Conference.

All disputes to be settled by the Committee responsible for completion of each stage. Dates must be strictly adhered to. No extension of time can be given.

## LADIES' SPORTS.

Those responsible for the arrangements for the comfort and convenience of members and the ladies accompanying them are anxious to have information, which will enable them to satisfy everybody. As notified in our issue of April 4th, ladies accompanying members and lady members of the Association are to be made honorary members of the local golf and tennis clubs, and it will greatly assist in the arranging of matches and competitions if intending players will send their names in advance to Mrs. Dorceton, 16, Queen Square, Bath, who is Chairman of the Ladies' Sports Subcommittee.

## GARAGE ACCOMMODATION.

Members requiring garage accommodation for the whole or part of the period of the meeting are requested to make early application to Mr. C. Terry, F.R.C.S., 15, The Circus, Bath.

8 p.m.—Masonic Meeting.  
9 p.m.—Ladies' Ball.

SATURDAY, JULY 25th.  
Various Excursions.

## British Medical Association.

## CURRENT NOTES.

## Opening of the New British Medical Association House.

MANY inquiries are being received as to the opening ceremony on July 13th, announced in last week's JOURNAL at p. 1047. It is expected that it will be possible to make a full announcement in the JOURNAL of next week. In the meantime it may be said that the number of seats available will be far fewer than the applications made for them, and it is apparent that after the allocation of seats to the official guests, members of the Reception Committee, members of Council, and official representatives of the Branches and Divisions, it will be necessary to ballot for the remainder of the seats, which will be comparatively few. The names of those applying for admission are being noted for the ballot.

## The "British Medical Journal": New Address.

The Editorial and Printing Departments of the BRITISH MEDICAL JOURNAL have been removed from 429, Strand, to the new headquarters building of the British Medical Association in Bloomsbury. The postal address for all communications intended for the Editor is "BRITISH MEDICAL JOURNAL, British Medical Association House, Tavistock Square, W.C.1," the telephone number of the Editorial Department is Museum 9864, and the telegraphic address "Aitiology, Westcent, London." Until further notice is given in these columns, all communications with reference to advertisements, as well as orders for copies of the JOURNAL, should continue to be addressed to the Financial Secretary and Business Manager, and the Library of the Association will be removed about June 17th, and the Finance Department about June 18th.

## Association Notices.

NOTICES OF MOTION BY DIVISIONS FOR THE  
ANNUAL REPRESENTATIVE MEETING,  
BATH, 1925.

## Salaries of County Medical Officers of Health.

By SHROPSHIRE AND MID-WALES: That (with reference to the Recommendation contained in para. 164 of the Annual Report of Council) the minimum commencing salary of County Medical Officers of Health, with a county population not exceeding 50,000, be £800-£900 per annum.

## Salaries of "Medical Officers Employed in Departments."

By NORTH GLAMORGAN AND BRECKNOCK: That (with reference to the Recommendation contained in para. 164 of the Annual Report of Council) in the opinion of the Representative Body the minimum commencing salary for "Medical Officers employed in Departments" should be £500 per annum, and that the Council be instructed to take such action as is necessary to modify the scale in this respect.

## Income Tax and Subscription to the Association.

By NEWCASTLE-ON-TYNE: That (with reference to para. 112 of the Annual Report of Council) for the purposes of assessment for income tax, members of the profession who are assessed under Schedule E should be entitled to a rebate in respect of the subscription to the British Medical Association and kindred societies in the same manner as those who are assessed under Schedule D.

## Individual Medical Defence.

By CARDIFF: That as the matter of individual medical defence is being competently dealt with by various existing bodies, and as it does not appear that the Association could conduct medical defence in any cheaper or better manner, and as the provision of individual medical defence is not within the present powers of the Association, this meeting is of the opinion that the matter should be dropped, and that the expense of the proposed referendum of the profession be not incurred; but that the Association should bring to the notice of all practitioners, especially those recently qualified, the urgent necessity of joining one of the medical defence bodies.

## CHANGES OF AREAS.

## FORMATION OF A ST. PANCRAS DIVISION.

NOTICE is hereby given to all concerned that at the request of a meeting of Members and Non-members resident in the area of the Borough of St. Pancras and with the approval of the Metropolitan Counties Branch and Hampstead Division, the Council hereby forms a St. Pancras Division of the Metropolitan Counties Branch of area co-terminous with St. Pancras Borough, the area of the Hampstead Division being modified accordingly. The new Division comes into existence as from the date of publication of this notice.

## NEW BRANCH OF THE ASSOCIATION.

## PORT ELIZABETH BRANCH.

NOTICE is hereby given to all concerned that the Council of the Association has approved the formation, by the South African Committee, of a Port Elizabeth Branch, of area co-terminous with the combined areas of the following districts: Port Elizabeth, Uitenhage, Willowmore, Jansenville, Humansdorp, Uniondale, and Knysna, the new Branch to come into existence on April 21st, 1925. The area of the Cape of Good Hope (Eastern) Branch is modified accordingly.

Representation in Representative Body: Under the standing provision made by the Council, the Branch will be entitled to return one Representative to the Representative Body.

## TABLE OF DATES.

June 13, Thurs. Meetings of Constituencies must be held between this date and July 17th to instruct Representatives.  
June 27, Sat. Supplementary Report of Council appears in SUPPLEMENT.  
July 3, Fri. Amendments and riders for issue in A.R.M. Agenda must be received by this date.  
July 13, Mon. Opening of the New House of the British Medical Association by His Majesty King George accompanied by Her Majesty Queen Mary.  
July 17, Fri. Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.  
July 18, Sat. Annual Representative Meeting, Bath.  
July 20, Mon. Council, and Annual Representative Meeting, Bath.  
July 21, Tues. Annual General Meeting.  
July 22, Wed. Conference of Honorary  
July 23, Thurs. Bath.  
July 24, Fri. Bath.  
ALFRED COX, Medical Secretary.

Meetings of Branches and Divisions.	
PLACES TO BE HELD	
AND GALE	

be provided at the Infirmary after the meeting, by the kindness of the members of the West Cornwall Division. The annual dinner of the Branch will be held at 7.15 p.m. at the Red Lion Hotel, Bournemouth, 20, Lemon Street, Truro. Early application for tickets will greatly facilitate arrangements, and in any case should be made not later than first post of Saturday, June 20th. Accommodation can be privately arranged for visitors intending to stay the night at Truro, provided notice is received.

**SUFFOLK BRANCH:** West Suffolk Division.

West Suffolk Division will be held at the same time and place as the last meeting of the Suffolk Division.

provided notice for visitors intending to stay the night a  
Suffolk Branch: WEST SUFFOLK DIVISION.—A meeting of the  
West Suffolk Division will be held on Tuesday, June 23rd, for the  
consideration of the Annual Report of Council, which will be pre-  
sented as follows: Dr. O. R. M. Wood, Preliminary, finance,  
organization, British Medical Journal; Dr. G. H. Metcalf,  
science, medical ethics; Dr. B. E. A. Batt, Medico-political, Parlia-  
mentary elections; Dr. Grace Griffith, National health insurance,  
non-pand, public health and Poor Law, hospitals, naval and military,  
combined clinical and social meeting of the Division, August 6th, when Dr.  
ance on Thursday, August 6th, when Dr.  
garden will follow.  
Suffolk Division.

**SURREY BRANCH.**—The annual meeting of the Surrey Branch will be held in the Guildhall, Guildford, on Wednesday, June 24th, at 1.45 p.m. Agenda: To receive (a) report of the election of new officers, who shall thereupon take office; (b) report of the Branch Council and the annual financial statement. Address by the President, Mr. Sir Henry Gauvain will proceed by car to Alton, where he will be held at the Angel Hotel, Guildford, at 1 p.m. After Governor Lord Mayor Treloar Gauvain will afterwards conduct the party to tea at his private clinic at the Angel Hotel, Guildford, at 7 p.m. (tickets 7s. 6d., exclusive of wine). It is hoped that as many members as possible will stay to the dinner.

**WILTSHIRE BRANCH.**—The annual meeting of the Wiltshire Branch will be held at the Trowbridge Division, at the Trowbridge Hotel, Trowbridge, on Saturday, June 26th, at 1.45 p.m. Agenda: To receive (a) report of the election of new officers, who shall thereupon take office; (b) report of the Branch Council and the annual financial statement. Address by the President, Mr. Sir Henry Gauvain will proceed by car to Alton, where he will be held at the Angel Hotel, Guildford, at 1 p.m. After Governor Lord Mayor Treloar Gauvain will afterwards conduct the party to tea at his private clinic at the Angel Hotel, Guildford, at 7 p.m. (tickets 7s. 6d., exclusive of wine). It is hoped that as many members as possible will stay to the dinner.

**WILTSHIRE BRANCH:** Trowbridge Division.—A special general meeting of the Trowbridge Division will be held at the Trowbridge Town Hall to-day (Saturday, June 13th) at 3 p.m. Agenda: Arrangements for the entertainment by the Division of visitors to Bradford-on-Avon from the Annual Meeting at Bath on July 23rd next; appoint a Representative of the Division of visitors to attend the Queen on July 13th. The following provisional programme has been drawn up by the Executive of the Division: (1) Clinical afternoon meeting at Devizes early in December, when Mr. Cecil Terry, F.R.C.S., will read a paper, to be preceded by a dinner. (2) Evaluation, to be followed by supper, in Trowbridge Town Hall early in March, 1926.

**WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.**—The annual meeting of the Worcestershire and Herefordshire Branch will be held at the Worcester General Infirmary on Thursday, June 18th, at 3 p.m. Business: To elect (a) President, 1926-27; (b) honorary secretary and treasurer; to receive Council's Report and the annual financial statement. At the conclusion of business Dr. Dryland vacates the chair and will introduce his successor, Dr. Neville Crowe. Cases and notes of clinical interest will be shown. It is proposed that members meet for lunch at the Crown Hotel at 1.15 p.m. The Branch Council will meet at 2.45 p.m.

**YORKSHIRE BRANCH: SHEFFIELD DIVISION.**—The Sheffield Division will be held at the Sheffield, on Tuesday, June 14th, at 1.15 p.m. The Divisional Committee will be held at the Sheffield, on Tuesday, June 14th, at 1.15 p.m. The Divisional Committee will be held at the Sheffield, on Tuesday, June 14th, at 1.15 p.m.

Yorkshire Branch: SHEFFIELD DIVISION.—A general meeting of the Sheffield Division will be held at the Church House, St. James Street, Sheffield, on Tuesday, June 23rd, at 8.30 p.m. Agenda: Consider Report of Council (SUPPLEMENT, BRITISH MEDICAL JOURNAL, April 11th); instructions to Representatives. Several members have consented to introduce the discussion of important sections of Council's Report as follows: Medico ethics, Dr. Helm; medico political, Dr. Forbes; national health insurance, Dr. Mackinnon; public health, Dr. Wyne; hospitals, Mr. A. Garrick Wilson.

## Meetings of Branches and Divisions.

Branches and Divisions.

BORDER COUNTIES BRANCH: DUMFRIES AND GALLOWAY DIVISION.

The annual meeting of the Dumfries and Galloway Division was held in Dumfries on May 21st, and as the weather was fine the attendance was a "record" one. After the routine business, which included the election of Dr. P. M. Kerr as Chairman and Dr. M. B. Steuart as Vice-Chairman, and the re-election of the other officials and committees, instructions were given to the representative in the Representative Body. Dr. Kerr briefly introduced an interesting and instructive lecture on the treatment of abortion. He dealt with his subject in such a lucid and practical way as to command the rapt attention of all present. After tea an animated discussion followed, in which Drs. SELBY, LIVINGSTON, HUNT, BRYSON, HUSKIE, ELNER, JOSEPH HUNTER, ROBERTSON, WELLS, and KERR took part. Professor WATSON'S reply brought to a close one of the most successful meetings of this Division.

CONNAUGHT BRANCH:

annual general meeting of the Connaught Branch was held in the Royal Victoria Hotel, Dublin, on the 21st inst.

The annual general meeting of the Connaught Branch at the Railway Hotel, Gnlwa, on May 23rd, when Dr. R. B. MARON was in the chair. The following officers were elected :  
President, Dr. R. L. Roe, O.B.E. *Honorary Secretary and Representative in Representative Body*, Dr. John Mills.  
The Annual Report of Council was considered and the HONORARY SECRETARY reported on the work done by the last Representative Meeting.

The annual general meeting of the Connought Branch, at the Railway Hotel, Glnway, on May 23rd, when Dr. R. B. MARION was in the chair. The following officers were elected :  
*President*, Dr. R. L. Roe, O.B.E. *Honorary Secretary and Representative in Representative Body*, Dr. John Mills.  
The election of Dr. Denis Walsh to the Council was agreed to. The Annual Report of Council was considered and the *Honorary Secretary* reported on the work done by the last Representative Meeting.

On the motion of Dr. E. S. FOLEY, seconded by Dr. GRAY, the following resolution was unanimously carried:

That the Connaught Branch congratulates Dr. Hennessy on his election as a member of the Hall, and is of opinion that his opportunities of supporting the interests of the profession will be greatly increased thereby.

#### MALAYA BRANCH.

The annual general meeting of the Malaya Branch was held at Kuala Lumpur on April 10th, 11th, and 12th.

At the business meeting on April 10th, Dr. G. B. McHUTCHINSON, who presided, read his report as outgoing President.

The following officers were elected for the year:

*President:* Dr. A. R. WELLINGTON. *President-Elect:* The Hon. Dr. A. L. HOORS. *Vice-President:* Dr. Hunter (for Singapore), Dr. Glass (for Penang), Dr. Macaulay (for F.M.S.). *Representatives:* Council of Straits Settlements: Sir David Galloway, Dr. Noel Clarke; Council of F.M.S.: Sir Malcolm Watson, Dr. McHutchinson; Council of King Edward VII Medical School: Dr. Ratnay. *Branch Council—Singapore:* Dr. English, Dr. Chen Su Lan; Penang: Dr. Sharp; F.M.S.: Dr. Skae. *Honorary Secretary:* Dr. Dawson. *Honorary Treasurer:* Dr. Noel Clarke.

Dr. A. R. WELLINGTON read a paper on coolie welfare in Sumatra, which was followed by a discussion in which the CHAIRMAN, Sir MALCOLM WATSON, the Hon. Dr. A. L. HOORS, and Drs. E. H. BLACK, SKAE, and HAZEA took part. Sir DAVID GALLOWAY read a paper on inguinal lymphadenitis. The CHAIRMAN, Drs. FLETCHER and K. BLACK took part in the subsequent discussion. Dr. A. NEAVE KINGSBURY gave a demonstration of the preparation of antirabic vaccine, and of a paralysed rabbit and sheep which had been inoculated with the fixed virus. During the afternoon visits were made to the infant welfare centre and the malaria bureau.

On the morning of April 11th Mr. H. LEIGH BENNETT gave an interesting demonstration of the principles and difficulties of anti-malarial drainage. Sir MALCOLM WATSON gave a lantern demonstration in the Institute for Medical Research on estate sanitation in Assam: the CHAIRMAN (Dr. A. R. WELLINGTON) and the Hon. Dr. A. L. HOORS took part in the discussion. The Hon. Dr. A. L. HOORS read a paper on malarial research in the Lee County, South Georgia, U.S.A., which was discussed by the CHAIRMAN, Sir MALCOLM WATSON, Drs. BARNES and RUSSELL of the Rockefeller International Health Board, and Dr. E. H. BLACK. Dr. G. B. McHUTCHINSON read a paper on (a) a case of thrombo-angiitis obliterans, (b) a case of bismuth poisoning: Drs. FLETCHER and KINGSBURY took part in the discussion.

In the afternoon Lieut.-Colonel HOPE FALKNER read a paper on the results of venereal prophylaxis, which was discussed by the CHAIRMAN, Dr. A. L. HOORS, Dr. VISWALINGAM, Dr. FLETCHER, the Mr. HANNIGAN. Dr. PASLEY demonstrated a case of abnormal development of the ileum, and Drs. K. BLACK and KINGSBURY discussed the specimen. Dr. PASLEY then read a paper on a series of cases of gastro-enterostomy, and the CHAIRMAN, Dr. K. BLACK, the Hon. Dr. A. L. HOORS, Dr. McHUTCHINSON, Dr. COSGRAVE, and Dr. VISWALINGAM took part in the discussion. Dr. VISWALINGAM read a paper on granuloma pudendi, which was discussed by the CHAIRMAN, Drs. FLETCHER, K. BLACK, and McHUTCHINSON.

During the afternoon the annual golf competition for the Watson Cup was held at the Selangor golf course, when Dr. D. C. Macaskill won with a score of 81 net.

The annual dinner was held at the Empire Hotel at 8 p.m. Fifty-four persons were present at the dinner, which was followed by a dance at the Selangor Club.

On April 12th Dr. E. A. O. TRAVERS exhibited cases of leprosy which had showed great improvement under treatment. He described the organization of the Kuala Lumpur Leprosy Asylum and also gave a demonstration of the anti-opium treatment under his direction at the District Hospital.

#### SURREY BRANCH: GUILDFORD DIVISION.

The annual meeting of the Guildford Division was held on June 4th at the Royal Surrey County Hospital, Guildford, when Dr. LANKESTER, and afterwards Dr. WILLIS, was in the chair.

The following officers were elected:

*Chairman,* Dr. J. K. WILLIS, Horsham Road, Cranleigh. *Vice-Chairman,* Mr. E. W. SHEAF, Guildford. *Joint Honorary Secretaries,* Dr. W. B. JEPSON, M.C., Sayes, West Byfleet; Dr. F. T. HOLLOWAY DAVIES, 6, Dapdune Crescent, Guildford.

The annual report of the Executive Committee, together with the report and accounts of the Division, were received and adopted.

The practice of education medical officers issuing blank certificates signed by them and authorizing school nurses, when visiting public elementary schools, to complete the certificates by inserting the name of the disease for which the child is excluded by her, and the number of weeks for which the child is excluded, was discussed, and strong exception to this procedure was taken on ethical grounds.

#### YORKSHIRE BRANCH: YORK DIVISION.

The annual meeting of the York Division was held in the York Medical Society's Room on May 9th, when Dr. J. G. CRAIG, Vice-Chairman, presided. The following officers were elected:

*Chairman,* Dr. J. G. CRAIG. *Vice-Chairman,* Dr. P. Macdonald. *Honorary Secretary,* Dr. J. C. LYTCH. *Representative in Representative Body,* Dr. P. Macdonald. *Deputy Representative,* Dr. H. E. King Reynolds.

The HONORARY SECRETARY having pointed out that, as the Yorkshire Branch would hold its annual general meeting in York in 1926, the Division had the privilege of nominating the President of the Branch for that year, Dr. Peter Macdonald was unanimously nominated.

Dr. H. E. K. REYNOLDS introduced the subject of lack of hospital accommodation in the district for certain types of cases, particularly measles complicated with pneumonia, pneumonia in late pregnancy, and influenza with pneumonia. He pointed out that apparently the infirmary was the only institution into which such cases could be sent, and that it was neither a suitable place for infectious diseases such as measles nor for pneumonia which might be expected at any moment to be complicated by confinement. The medical officer of health, Dr. McNAUGHT, replying, agreed that there was a great shortage of accommodation at the Fever Hospital, and that special wards should be provided. He agreed that it would be useful if the Division, by deputation to the Health Committee, pressed for an extension of fever hospital accommodation. He however advised that the best prospect of securing reforms in medical matters lay in securing more medical members on the City Council. He stated that the Maternity Hospital could take cases of pneumonia in late pregnancy. There was also limited accommodation for cases of puerperal fever at the Maternity Hospital. After further discussion the Chairman, the Honorary Secretary, and Dr. H. E. K. Reynolds were appointed to wait on the Health Committee with a view to pressing for further accommodation for special cases.

It was decided to present a flag for the Great Hall of the new House of the Association, representing the city of York (where the Association had held its Annual Meeting).

The Annual Report of Council, 1924-25, was considered, and the HONORARY SECRETARY drew particular attention to certain sections.

A vote of thanks was unanimously accorded to the Honorary Secretary, Dr. Lyth, for his services during the past year.

## National Insurance.

### LONDON PANEL COMMITTEE.

At a meeting of the London Panel Committee on May 26th, with Dr. H. J. CARDALE in the chair, the resignation from the Committee of Dr. R. W. COUNCELL, representing Southwark, on the ground of ill health was tendered and accepted with much regret.

#### Disciplinary Action and Errors of Professional Judgement.

Dr. A. S. HERBERT moved a resolution which, after some slight amendments had been accepted, was carried in the following form:

That this Committee views with concern the growing tendency in certain official quarters to regard errors of professional judgement by panel practitioners as breaches of the regulations; and also that an interpretation is being attached to the words "proper standard of medical treatment," which is contrary to that usually understood by the medical profession.

That this Committee therefore wishes, with a full sense of responsibility, to affirm—

(1) That mistakes both in diagnosis and treatment are sometimes inevitable; that such mistakes, when honestly due to error of judgement and not due to gross negligence, should not be considered as breaches of the regulations, and should not be subject to disciplinary action.

(2) That there is not, and cannot be, any fixed "proper standard of medical treatment"; and that any attempt to fix such a standard would be a retrograde measure in that it would tend to stereotype treatment, and would be by no means in the best interests of the patients.

It was agreed to forward the resolutions to the Ministry of Health and the Insurance Acts Committee.

#### The Prescribing of Brandy.

A long discussion took place on a letter from the Insurance Committee asking for the observations of the Panel Committee upon the case of an insured person who had been instructed by her doctor to take a teaspoonful of brandy after heart attacks, to which she was subject. Her approved society, however, suspended her from benefit for a breach of the rules in obtaining spirituous liquor otherwise than on a medical prescription. Consequently upon the receipt of a semi-official letter from the Ministry of Health by the Insurance Committee stating that it had been held in previous cases that where brandy was necessary in the opinion of the practitioner for some definite therapeutic purpose it must be regarded as a drug which could be supplied at the cost of the Drug Fund, the practitioner concerned was advised by the Insurance Committee that he might order brandy if he considered it necessary for medical purposes, and a prescription was accordingly issued by him. Notwithstanding the fact that the Ministry had stated that it was understood that a pharmacist could dispense brandy ordered on medical prescriptions without being in possession of a spirit licence, the Insurance Committee now stated that a communication had been received from the insured person reporting that she had taken the prescription to several pharmacists but had been unable to obtain the brandy.

After some amendments had been proposed and lost, the Panel Committee agreed to the original recommendation of its Pharmacy Subcommittee, to inform the Insurance Committee that it did not look with approval upon the prescribing of brandy by practitioners in the circumstances.

# GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION. SUMMER SESSION, 1925. (Concluded from p. 249.)

## DENTAL BUSINESS.

### Final Dental Examinations.

SIR JAMES HODSDON brought forward a report of the Dental Education and Examination Committee on the inspection of the final dental examinations. The report set out the result of the inspections made between June, 1923, and December, 1924, by Mr. J. Howard Mummery, the appointed inspector. Mr. Mummery stated that the examinations in the fifteen bodies covered by his report were very satisfactory. The subjects included in the final examination varied considerably at different centres. Thus, while practical dental mechanics was included in the final examination at Belfast, Edinburgh, the Royal College of Surgeons in Ireland, and the National University, by the other examining bodies it was included in a previous examination. Dental anatomy was included in the final examination at Belfast, Edinburgh, Glasgow, and Leeds, but not in any other final examination. An insufficient proportion of candidates appeared to have been asked to perform extractions at Birmingham, Bristol, Dublin (University), the Royal College of Surgeons of England, Liverpool, Manchester, and Sheffield. In some instances the test was not apparently required at all.

The Committee brought forward the following recommendations:

1. That every subject included in the curriculum should form the subject of a written and oral or practical examination.
2. That two examiners should always participate in the oral or practical examinations of a candidate.
3. That whatever may be the system of marking, the percentage for a pass in each subject should not be less than 50 per cent.
4. That it is desirable that, where possible, the practical operative examination in clinical subjects should be conducted on the living subject, and should include dental prosthetics and orthodontia.
5. That it is desirable that, where possible, candidates should be tested in the administration of general anaesthetics in connection with dental practice, and should be required to perform extractions.
6. That the dental subjects of the final examination should be passed at one time.
7. That in the regulations for the several examinations it should be provided that examiners in assessing marks should be empowered to take into account the duly attested records of work done by the candidate throughout his course of study in the subjects of examination.
8. That a candidate remitted in any subject of a professional examination should, before he is readmitted to examination therein, be required to produce satisfactory evidence that he has, during the interval of remission, pursued, at a recognized medical school or dental hospital, the study of the subject in which he was rejected.
9. That candidates who obtain less than 30 per cent. of the marks in any subject should be remitted for a longer period than three months for further study in that subject.

All these recommendations were accepted by the Council, with slight amendments in Nos. 1 and 5. No. 1 was made to read: "That every subject of the professional examination should form the subject of a written and of an oral or practical examination," and No. 5 was amended to read "candidates should be tested in the mode of administration of general anaesthetics," etc.

SIR ARTHUR CHANCE, speaking on No. 4, said that if the student was extracting a tooth and in the extraction broke a jaw he would not be protected as a qualified man was protected. The PRESIDENT said that he was not sure that the qualified man was protected. Sir ARTHUR CHANCE replied that at all events in medicine no student in the practical examination was allowed to do substantial operations on the living subject. Professor LITTLEJOHN, in speaking on No. 5, hesitated to accept the view that the giving of an anaesthetic should be the subject of a practical examination. He would much rather suggest that the student's outside work should be taken into account. Mr. GUY said that in his own school the student attended for a month at a time for instruction in anaesthetics, and he had to have a certificate that he had administered an anaesthetic fifty times before he was signed out. He was invariably tested in this subject in the final examination by two examiners were present. Professor LITTLEJOHN thought that the conditions in the routine of education were somewhat different from those obtaining in examinations, and that in view of the special strain which an examination imposed upon the student he should not be required to give an anaesthetic.

The PRESIDENT asked whether it was fitting that persons should be sent out licensed to administer anaesthetics and the Council not be able to assure the public that their capacity had been tested. He added that these resolutions were based upon those already agreed to by the Council for the medical student; they carried into the narrower field of dental examination the principles adopted for medical examination, and as the resolutions were to be sent to the licensing bodies for their observations thereon, should any of them prove unwelcome the Council would be informed to that effect in due course.

## DISCIPLINARY CASES.

The last of the postponed cases was that of Dr. Nowroji Merwanji Tarachand, registered as of Mansfield, Nottingham, against whom a charge of lax certification had been proved (SUPPLEMENT, June 7th, 1921, p. 271). The Council's solicitor, Mr. Harper, stated that Dr. Tarachand was in a position of some difficulty, because he had sold his practice at Mansfield, and had not practised at all since the previous hearing, therefore he could not obtain the usual testimonials as to the character of his practice in the interval. He had, however, obtained testimonials as to his general character from the two practitioners to whom he had sold his practice.

Dr. Tarachand stated that he had been in practice for the last thirty years, and in insurance practice for the last twelve years; this was the only instance of complaint against him, and he affirmed that he was the victim of jealousy and prejudice. The President reminded him that this was not relevant. Dr. Tarachand added that he had no present intention of practising, but if he did he would be very careful that no occasion of further offence arose.

The Council did not see fit to direct the Registrar to erase Dr. Tarachand's name.

## Misdemeanours.

The case was considered of Dr. Henry James Burke, M.C. registered as of Hadfield, Derbyshire, who was summoned on a charge that he had been convicted in 1924 at the Glossop police court of driving a motor car in a manner dangerous to the public, and at Mottram petty sessions of being drunk in the public motor car. On the first conviction he had been fined and his licence endorsed, and on the second fined 40s. and in default of payment suspended for twelve calendar months. Mr. Harper, the Council's solicitor, stated that since the charge was preferred a further conviction had been discovered, intermediate in date between the other two, for being drunk in charge of a motor car when the defendant was fined two guineas and one guinea costs. Mr. Whittingham, solicitor, who appeared for Dr. Burke, said that his client had asked him to express his deep regret, and to assure the Council that there was no likelihood in future of any deviation from the conduct rightly expected of a medical man. The convictions were not deemed, but there were certain facts to be urged in extenuation. All the convictions were before local magistrates, none of them before a high court judge, a recorder, or even a stipendiary, and in the courts of local magistrates evidence was not always closely tested. Complaint was also made that when Dr. Burke was tested by the police with a view to discovering whether his condition was such that he was capable of driving a motor car, the car afforded him was of an entirely different manufacture from the one he had been accustomed to drive. He handed in on Dr. Burke's behalf four testimonials from important local people, and mentioned that Dr. Burke had served with conspicuous gallantry in the war, venturing out under the open fire of the enemy to attend a badly wounded soldier. He had served, not only in France and Belgium, but in the East, where he had contracted malaria and dysentery, and at the time of these events he was suffering from the effects of these illnesses.

The decision of the Council was announced by the PRESIDENT as follows:

Dr. Burke: I have to inform you that it has been proved to the satisfaction of the Council that you have been convicted of the repeated misdemeanours charged against you in the Notice of Inquiry. These convictions indicate a habit which may be dangerous to a professional man, to the public, and to the patients under his charge, but trusting to your assurance that you will reform your habits in this connexion and in order to give you an opportunity of proving your good faith, they have postponed pronouncing judgement in your case until May next.

Before that date you will be required to send to the Registrar of Council the names of some of your professional brethren or other persons of position in your neighbourhood, who may be willing upon written application from the Registrar to testify by letter, addressed to him for the use of the Council, that you have in fact been sober and have avoided the danger of such lapses as have occurred in the past. You will receive in due course a formal written intimation of what I have just announced to you, and the intimation will specify the date to which I have referred, when you should be present.

The next case was that of Dr. John Edward Rees, registered as of Glandwr, Trecastell, Cardiganshire, who was summoned on a charge that he had been convicted at petty sessions in 1921, 1922, and 1924, of being found drunk, in two cases on the highway, and in the third case on licensed premises, and also on the last occasion of driving a motor car in a manner dangerous to the public.

Dr. Rees was defended by Mr. J. C. Williams, solicitor. In the witness box the defendant denied that he had ever been drunk, and he explained the circumstances in which in each of these cases he had taken a very small amount of stimulant to combat excessive fatigue or illness. On the occasion of the last conviction he did not make any defence at the sessions,

hoping—vainly as it proved—thereby to stop publicity, which would have distressed his wife, who was then in delicate health. During the war he had seen a great deal of service, including Gallipoli and North Russia, and some of these troubles were to be attributed to a legacy of colitis and other illness the result of his war experiences. He was now a total abstainer and intended to remain so. In a letter to the Council he had stated that the charge against him arose as the result of "the insatiable jealousy of rival practitioners." The President pointed out that the convictions were on police charges with which "rival practitioners" had nothing to do, and a letter was read from a doctor in the locality which stated, "I do not believe that Dr. Rees is victimized by his fellow practitioners, but I am sure they do not like his convictions."

Certain evidence was called on behalf of Dr. Rees, including that of a dispenser of Newcastle Emlyn, who testified as to the number of prescriptions he had dispensed for Dr. Rees, and that the latter appeared to be unwell shortly before the date of his last conviction. A Welsh Presbyterian minister also testified to Dr. Rees's high reputation, and other testimonials to professional character were put in.

The President announced the Council's decision, which was in exactly the same terms as in the case of Dr. Burke, already heard, judgement being postponed until May, 1926.

The case was considered of Dr. Austin Heron, registered as of Stranorlar, co. Donegal, who was charged with having been convicted on February 12th, 1925 (in the name of William Gallagher), at the Sutton petty sessions, of certain misdemeanours (exposing his person in the public highway), and fined £5 in one case and £5 and 5s. costs in the other.

Dr. Heron appeared on his own behalf and gave an explanation of the occurrence.

At the conclusion of the hearing the President announced that the Council had found the alleged conviction to have been proved. They recognized that such a conviction was very detrimental to the character of a medical man, and to that extent a discredit to his profession. In order to give the defendant an opportunity of proving that he had re-established his character they adjourned pronouncing judgement until the May session, 1926, when Dr. Heron would be required to appear and to furnish testimonials.

#### Felonies.

The case was considered of Dr. Sureswar Sarkar, registered as c/o Grindlay and Co., Parliament Street, London, who at the Leeds Assizes in March last was convicted of rape and indecent assault and sentenced to five years' penal servitude.

This case was heard in the absence of the accused. Mr. Harper stated that he had a letter from the Governor of Leeds Gaol, where Dr. Sarkar was serving his sentence, stating that the prisoner did not wish to attend, but was preparing a statement to be read; this, however, had not come to hand. The case, as revealed at the assizes, showed a continued series of offences of the most serious character. Sarkar had had quite a distinguished career in medicine. He had won prizes and scholarships in Calcutta, and had held various positions in India, one of them on the medical staff of Lord Kitchener when Commander-in-Chief of the Indian Army. He had also served on various frontier expeditions, and in the war had served in Mesopotamia and elsewhere. He had recently been practising in Sheffield, where the crimes were committed.

The President announced that Sureswar Sarkar having been proved to have been convicted of the felony alleged against him in the Notice of Inquiry, the Registrar had been directed by the Council to erase his name from the *Medical Register*.

Dr. Alex. John Douglas Cameron, registered as of Adelaide House, Northampton, was summoned on the charge:

That you were on October 17th, 1924, convicted of the following felony—namely, of unlawfully killing John Rowlett Corner, and were sentenced to be imprisoned in the second division for nine calendar months.

Dr. Cameron was present, and was defended by Mr. A. Neilson, K.C.

Mr. Harper, solicitor to the Council, said that on Whit-Monday, 1924, Dr. Cameron and another doctor who had been serving as his locumtenent, went from Northampton to Leicester by motor car, Dr. Cameron driving; on returning, the car, which it was alleged was travelling on the wrong side of the road, collided with a motor cycle and sidecar, driven by a farmer named Corner. Corner and the occupant of the sidecar were thrown out and seriously hurt, Corner dying within three days. Dr. Cameron did not stop his car, but rode right on to Northampton. On arriving there it was discovered that extensive damage had been done to the footboard and other parts of the car which Dr. Cameron had been driving. The police also called a number of witnesses to prove reckless driving by Dr. Cameron on that occasion. It was said that if a tourniquet had been applied in time the man's life might have been saved.

Mr. Neilson said that neither Dr. Cameron nor his companion was aware at the time that an accident had occurred. Dr. Cameron thought that it was a very near thing, but that the two vehicles had just escaped collision. It was not his own car, which had broken down, but a car which he found difficult to steer, and the driving of which was rather strange to him: There was no suggestion by the prosecuting counsel or by the judge that Dr. Cameron had any idea that he had struck these people. The judge, in passing sentence, had said, "I am certainly not going to assume for one moment—I do not believe—that you were aware of the harm you had done." The judge had also added, "Nor do I think for one moment that you were what is popularly known as drunk." Mr. Neilson thought that Dr. Cameron's present position was one which might well evoke sympathy. He had suffered his penalty,

had been, in fact, punished most severely, and had "tholed his assize." But the circumstances of this conviction did not involve infamous conduct in a professional respect.

The President said that that was not alleged in the charge.

Mr. Neilson argued that when the Council was considering whether this conviction was of such a nature as to require or not require the erasure of the name of the practitioner, one of the matters which it was fair and proper to consider was whether the offence had any bearing upon professional character.

The President: Yes; but you must not take it that we accept that as a limitation on our powers.

Mr. Neilson added that Dr. Cameron, who qualified in 1909, was very highly regarded in Yorkshire, where he first practised, and in Northampton, and a number of testimonials were put in on his behalf, including one from Sir James Purves-Stewart, who said that he had the highest opinion of Dr. Cameron's personal character and professional skill. Counsel urged that while Dr. Cameron had been careless and culpable in this particular matter, he was at least relieved from the most serious imputation—that, knowing an accident had occurred, he had driven on without stopping.

Mr. Harper said that while Dr. Cameron's testimonials showed his consideration for his patients, the question at issue for the moment was his consideration for the public. Had the various people who had testified as to his professional conduct been in the position of the police witnesses on the road that evening, who stated that he was driving on the wrong side, and at an inordinate speed, they might have qualified their testimony.

The Council deliberated *in camera* for half an hour, after which the President announced the decision as follows:

Mr. Cameron, I have to inform you that the Council do not see fit to direct the Registrar to erase your name from the *Medical Register*.

#### *Alleged Professional Relationship in Adultery.*

The Council considered the case of Dr. Charles Nathaniel Barton, registered as of Redcliffe Garder, who was summoned on the charge that he committed adultery with Mary Kate [redacted] with whom and whose family it was alleged he stood in professional relationship. He had been found guilty of adultery by the decree of the Divorce Court in 1924, made absolute in May, 1925, in the case of Abbott v. Abbott and Barton, in which he was the co-respondent.

Dr. Barton was defended by Mr. Oswald Hempson.

Mr. Harper, the Council's solicitor, stated that this was an undefended case of divorce. At the hearing of the case Mr. Justice Horridge had recalled the petitioner, Mr. Abbott, and asked him whether the co-respondent had been attending his wife professionally. Mr. Abbott answered in the affirmative, and Mr. Justice Horridge then said that the case must be reported to the General Medical Council. He understood that Dr. Barton entirely denied the professional relationship. Mrs. Abbott, whose husband was a civil servant, met Dr. Barton for the first time on a social occasion, and afterwards became, with her husband's consent, his part-time secretary at a salary of £5 a month. There were three occasions on which, it was alleged, Dr. Barton attended the Abbott family professionally. The Abbotts had another doctor, but he lived at some distance, and once when their child was ill Dr. Barton, being close at hand, was called in, but it was said that he merely gave the opinion that the child was teething and offered to telephone to the regular doctor if the parents thought it necessary; on the second occasion Mrs. Abbott consulted a specialist about herself, and Dr. Barton went with her; and on the third occasion Mrs. Abbott called in the doctor to see her husband.

Dr. Barton, in the witness box, said that when he was called in to see the child he did not treat or prescribe for it in any way. When he went with Mrs. Abbott to see the specialist he merely took her in his car (she was at that time his secretary), he stayed in the waiting-room, and had no consultation whatever with the specialist, whom he did not see until the moment before he left the house. He also described the circumstances in which he was called in on the third occasion, when, again, he did not perform any professional service.

Mrs. Abbott gave evidence bearing out these statements; and Dr. Lionel Smith, the specialist concerned, was also called, and said that he was first consulted with regard to Mrs. Abbott's case by Mrs. Abbott's regular medical attendant, not by Dr. Barton, and when she called on him on the later occasion Dr. Barton, whom he did not know, remained in the waiting-room during the whole time, and only appeared in the character of a friend.

Mr. Hempson pleaded on behalf of Dr. Barton that there was no evidence against his client. The only circumstance upon which the charge depended was the answer of Mr. Abbott in the Divorce Court to the question put to him by the judge. He submitted that that had no greater weight than a statutory declaration in the absence of a witness. Mr. Abbott was not called as a witness on the one side or the other.

After deliberation *in camera* the decision of the Council was announced by the President as follows:

Mr. Barton, I have to announce that the facts alleged against you in the Notice of Inquiry have not been proved to the satisfaction of the Council.

#### *Alleged Adultery: Practitioner Exonerated.*

A case which engaged the attention of the Council on May 29th and 30th and June 4th and 5th was one in which Dr. Wilfred Edgar Levinson, registered as of College Road, Brighton, was summoned to appear before the Council on the charge that, being a registered medical practitioner, he abused his position by committing adultery on divers occasions in September, 1924, and subsequently, with a married woman with whom he stood in professional relationship. The complainant was the husband.

Mr. E. Neve, counsel for the complainant, said that the wife, a Brighton lady, underwent an operation in 1921, when the anaesthetic was administered by Dr. Levinson. In 1921 she was found by a specialist to be suffering from some sequel of the earlier trouble, and certain treatment was advised, to be given twice weekly, which Dr. Levinson was asked to undertake. According to the lady, Dr. Levinson during his many visits became familiar, conversation proceeded on quite unprofessional lines, and ultimately misconduct took place. Divorce proceedings were not started, and the complainant and his wife still lived together. Some amateur photographs and some written and printed poetry which had been given by Dr. Levinson to his patient were produced. The lady herself gave evidence bearing out the counsel's narrative, and certain other evidence was given as to the long stay of the doctor's motor car outside the house, and to the curtains of the bedroom being drawn during his visits.

Dr. Levinson, in evidence, gave an absolute denial of the charge. He declared that he had never been guilty of misconduct in any shape or form. The lady was highly neurotic and inclined to be hysterical; when he visited her on one occasion he found that she had made a half-hearted attempt at suicide. What was described by her as being chatty and familiar was simply a device on his part to take her out of herself. He discovered that she also was an amateur photographer, and he brought her some snapshots of his own with the object of stimulating her interest in the pastime. He was accustomed to recite poetry at public gatherings, and to memorize it he wrote out the pieces. On his quoting some poetry on one occasion the lady expressed a desire to see the whole poem, and he sent her the manuscript which he had by him, and also the printed copy of another poem. His car had remained some time outside the house, because it was a convenient place to park the car while he paid several visits in the neighbourhood. The bedroom blinds were drawn because he had to make an examination on each occasion with a speculum, and wanted the room as dark as possible.

Many witnesses were called in support of Dr. Levinson, including Mrs. Levinson, who had accompanied him in the car on very many of the occasions during the period in question, and some of his patients, who spoke in the highest terms of his qualities as a practitioner and a gentleman. Some of them said that he was rather more chatty and affable than the average doctor, and they also bore witness to his interest in amateur photography and in poetry. They all agreed in saying that never on any occasion had they observed the slightest deviation from strict integrity in his conduct, and one or two of them spoke of his special devotion in serious illness.

Mr. A. Neilson, K.C., in his closing speech on behalf of the defendant, remarked on the entire lack of corroboration of what was alleged against him.

After a brief deliberation *in camera*—not more than five minutes—the President announced the decision as follows:

Dr. Levinson: The facts alleged against you in the Notice of Inquiry are that, being a registered medical practitioner, you abused your position by committing adultery on divers occasions in September, 1924, and subsequently, with a married woman with whom you stood in professional relationship. The Council have considered the evidence produced, and have come to the conclusion that the facts alleged as I have read in the Notice of Inquiry have not been proved to the satisfaction of the Council.

#### Misleading Certification.

The Council considered a charge against Dr. Sydney Edgar Price, registered as of Dudley Port, Tipton, Staffordshire, that he was responsible for, and moreover countenanced, the issue to eleven patients of thirty-two misleading and improper National Health Insurance certificates in that he allowed his clerk-dispenser to sign and issue them in his name and on his behalf.

Dr. Price was defended by Sir Henry Maddocks, K.C. Mr. Harper, solicitor to the Council, stated that the certificates in question were issued on various dates in 1924, chiefly in the first three months of that year; they were of all descriptions—first, intermediate, and final. The dispenser, a man named Whitehouse, who had since died, signed these certificates in Dr. Price's name, and also, it appeared, signed a number of prescriptions. An inquiry took place under the Insurance Act, and as a result of the finding Dr. Price was fined by the Minister of Health £100. Mr. Whitehouse stated at the inquiry that he had no authority to sign the certificates, and indeed had had instructions from Dr. Price not to issue them, but the people had pressed him to issue them, saying that they would otherwise be greatly inconvenienced, and he did it to assist them to get their pay.

Dr. Price went into the witness box, and was subjected to a long cross-examination, chiefly with regard to a bundle of about 170 prescriptions which represented, it was said, the whole of his insurance prescriptions during January, 1924; these had been issued in his name by someone else. Looking at the signatures, he could identify only one as positively his own. He said that it had not occurred to him as odd that he should have issued practically no insurance prescriptions during that month. His panel list was 2,500, but in the case of rather less than one-third of the persons on his list he was allowed to do the dispensing in his own surgery, and merely gave a slip of paper to his dispenser. Asked whether the people to whom the prescriptions were issued in January had been seen by him, he said that they could not have been. He was also asked whether he was absent at all from his practice during that month, and said that he did not remember.

The Clerk of the Staffordshire Insurance Committee, Mr. Hodgkins, said that if the doctor had been absent from his practice for more than seven days it would have been his duty to have given notice to the Committee, and there was no record of

Dr. Price having done so. His practice might be styled as semi-urban, and it was permitted to him to dispense for certain patients, whose names were given him. Accepting Dr. Price's figure of 1,800 as the number of persons on his list for whom he had to issue prescriptions, and 700 as the number for whom he could himself dispense, 170 prescriptions would be reasonable in the month of January.

Sir Henry Maddocks, on behalf of Dr. Price, said that his dispenser had been with him sixteen years and had come to know the patients and their ailments. Evidently the dispenser thought he knew as much about the patients as Dr. Price himself; he had confessed to giving the certificates and making out the prescriptions, and to using Dr. Price's name without his knowledge or authority. Counsel urged that none of these issues were wrongful so far as the person receiving them was concerned, that no harm had been proved in any case, and that in any event no moral obloquy attached to Dr. Price. If there had been laxity Dr. Price was sufficiently punished by the £100 fine imposed by the Minister of Health, and as the Minister did not see fit to strike him off the panel, it would scarcely be just for the Council to proceed to the larger penalty and erase him from the Medical Register.

Mr. Harper pointed out that the charge turned on the word "countenanced." There was nothing in the charge about prescriptions; that emerged during the hearing. Mr. Whitehouse, the dispenser, was now dead, but it had to be remembered, in view of what had been said about his confession before the Inquiry Committee, that he might have been biased in the direction of protecting the doctor, who was his employer and upon whom his bread-and-butter depended. This case might properly have come under a charge of "covering" an unqualified assistant. Sir Henry Maddocks had said that no harm had been done, but as to that there was no evidence.

After deliberation *in camera* by the Council, the President announced:

Mr. Sydney Edgar Price, I have to inform you that the Council have found the facts alleged against you in the Notice of Inquiry to have been proved; they have judged you to have been guilty of infamous conduct in a professional respect, and they have directed the Registrar to erase your name from the Medical Register.

#### Alleged Irregularities concerning Medical Benefit.

The Council next considered the case of Dr. Albert Edward Woolfe Sandelson, registered as of Bury New Road, Higher Droughton, Manchester, against whom certain charges had been made at an inquiry held in November last under the Medical Benefit Regulations on a representation by the Salford Local Medical and Panel Committee, that the continuance of the defendant on the Medical List would be prejudicial to the efficiency of the medical service of the insured.

Mr. Harper outlined the charges which had been made against Dr. Sandelson. They were that he had caused to be entered on his day-book sheets a record of attendance of an insured person for the purpose of claiming remuneration in respect of attendance, though the person had on no occasion been attended by him; that he obtained the medical card of this person, though the person had not applied to him for treatment; that he issued certain prescriptions in the name of this insured person, but actually for his son, who was not an insured person, and thereby imposed an improper charge on the drug fund; and, finally, that he entered records of one attendance and three visits to an insured person when in fact he had not made such attendance or visits on the dates in question. The Inquiry Committee found the charges established, except in the case of certain of the prescriptions. Mr. Harper reminded the Council that the arrangements in Manchester and Salford with regard to remuneration were different from those obtaining in the rest of the country; the doctors in that area were required to keep a record of their visits and attendances, and if a return was made by any practitioner of visits and attendances which did not in fact take place it imposed an unfair charge upon the insurance fund. The Council was at a disadvantage because, when the inquiry was opened, it was found that Dr. Smidelson had sent in his resignation from the panel (although it was not competent to do so when an inquiry was pending, without leave of the Minister), and was advised not to appear before the Inquiry Committee, which proceeded on the assumption that he had resigned.

Dr. Sandelson, in evidence, explained the circumstances in which attendances did take place in these cases. He admitted that certain records had been erroneously made by an assistant, but he emphatically denied any charge of "deliberately and fraudulently causing false entries to be made." He also pointed out that it was of no advantage to him to have another name on his list, because he had already exceeded by hundreds of attendances and visits the limit for which he could receive payment. Asked why, with so large an income from the insurance service, he had resigned from the panel, he said that when he found that certain erroneous entries had been made by his assistant, and certain certificates wrongly given, he, knowing himself to be responsible for his assistant's acts, and not wishing his honour to be questioned, resigned from the panel,

Dr. Sandelson was defended by Mr. T. Eastham, K.C., who read the statutory declaration of the patient principally concerned in these charges, and also that of his wife, which bore out Dr. Sandelson's statement as to his attendances. Dr. Sandelson, in evidence, explained the circumstances in which attendances did take place in these cases. He admitted that certain records had been erroneously made by an assistant, but he emphatically denied any charge of "deliberately and fraudulently causing false entries to be made." He also pointed out that it was of no advantage to him to have another name on his list, because he had already exceeded by hundreds of attendances and visits the limit for which he could receive payment. Asked why, with so large an income from the insurance service, he had resigned from the panel, he said that when he found that certain erroneous entries had been made by his assistant, and certain certificates wrongly given, he, knowing himself to be responsible for his assistant's acts, and not wishing his honour to be questioned, resigned from the panel,

as he understood from his legal advisers that if he did so there would be no public inquiry. This was wrong information, and he had also not been told that it was not competent for him to resign.

After deliberation *in camera* the President announced the Council's decision as follows:

Mr. Sanderson, I have to announce that the facts alleged against you in the Notice of Inquiry have not been proved to the satisfaction of the Council.

#### RESTORATION.

The President announced that the Council had restored the name of Nathaniel Stevenson to the Medical Register.

#### Dental Disciplinary Cases.

The Council considered three cases of charges against dentists on reports from the Dental Board. The name of Samuel Robertson Crosbie, registered as of Hamilton Street, Camden Town, "Dentist, 1921," who was found to have been convicted of a felony, fraudulent embezzlement, and sentenced to twelve months' imprisonment with hard labour, was ordered to be erased from the Register. The name of James Gny, registered as of 16, Eglinton Street, Belfast, "Dentist, 1921," who was found to have systematically canvassed for patients in Belfast by personal visits and by employing an agent or agents to canvass on his behalf, was also ordered to be erased. In the case of another dental practitioner, who had been convicted for misdemeanours, and against whom the Dental Board submitted an adverse report, it was stated that the practitioner was unable to appear because he was at present a patient in the Edinburgh Royal Infirmary, and the Council decided to remit the matter back to the Dental Board for further inquiry and report.

### Correspondence.

#### Nursing Homes (Registration) Bill.

Sir,—You have allowed me recently to draw the attention of the profession to many of the objectionable features in this bill, which gives the Minister of Health power to enter the private houses of those doctors who happen to have one or more patients *en famille*, as also every nursing home used by the middle and upper classes, in order to make all sorts of detailed inquiries, inspections, and demands, thus further infringing professional secrecy and our liberties.

The bill is down for second reading on Friday, June 19th, and Sir H. S. Cautley, Bt., has kindly put down a motion that it be read this day six months. As he finds himself, as he writes, committed "to lead the opposition," he has asked for a suitable memorandum on the subject. This is being provided him.

He would undoubtedly appreciate, and find of great assistance, one thing—that is, that every doctor who reads this send him at once at the House of Commons a postcard expressing strong approval and appreciation of his action on behalf of our profession. A similar postcard to the doctor's member of Parliament—same address—urging him to give his support to the "leader" would be of much service. This is quite a simple thing to do. May one hope that it will be done, and at once? Do not let us take any chances.—I am, etc.,

Hove, June 6th.

E. ROWLAND FOTHERGILL.

### Naval and Military Appointments.

#### ROYAL NAVAL MEDICAL SERVICE.

Messrs. J. Cussey, E. O'Reilly, and S. Morrow have entered as Surgeon Lieutenants, and have been appointed to Haslar Hospital for course of instruction.

#### ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Lieutenant H. O. Martin has been promoted to the rank of Surgeon Lieutenant Commander.

#### ROYAL ARMY MEDICAL CORPS.

Captain M. Ferguson to be temporary Captain, and relinquishes the rank of Captain.  
Captain J. Stephenson, M.C., half-pay list, late R.A.M.C., retires on account of ill health.

#### ROYAL AIR FORCE MEDICAL SERVICE.

Flight Lieutenant J. A. Quin is transferred to the Reserve, Class D.2.  
R. F. G. Dickson is granted a short-service commission as Flying Officer for three years on the active list.

#### INDIAN MEDICAL SERVICE.

The services of the following officers are placed permanently at the disposal of the Government of the Punjab: Major M. L. Puri, Major A. M. Dick, O.B.E., Lieut.-Colonel V. N. Whitmore, O.B.E., Lieutenant C. R. Henderson to be Captain.

#### MILITIA.

##### ROYAL ARMY MEDICAL CORPS.

The following Captains to be majors: F. G. Foster, W. E. Elliot, M.C., W. W. Wagstaffe, O.B.E., C. Atkinson, H. K. Ward, M.C., H. W. Maltby, M.C.

#### TERRITORIAL ARMY.

##### ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel C. I. Ellis, C.M.G., T.D., from R.A.M.C., T.A., to be Colonel (March 1st, 1925).

Second Lieutenant J. R. McDonald, M.C. (Inte Border Regiment), to be Lieutenant.

General Hospitals.—Major D. Dougal, M.C., to be Lieutenant-Colonel and to command 12th (2nd Western) General Hospital, vice Lieut.-Colonel J. H. Ray, vacated on completion of tenure.

#### COLONIAL MEDICAL SERVICES.

Lieut.-Colonel T. M. R. Leonard, D.S.O., Senior Medical Officer, West African Medical Staff, to be an Assistant Director of Medical Service in Nigeria, vice Dr. T. H. Dugon, deceased. Drs. J. H. Neill and R. G. Griffin appointed Medical Officer of Health, Jinja, and Medical Officer, Lake Area, Uganda, respectively. Dr. G. R. H. Chell appointed Deputy Principal Medical Officer, Eastern Province, Uganda. Dis. N. A. Robinson and A. M. K. O'Halloran, Women Medical Officers (Medical Department), Gold Coast, transferred to the Sanitary Branch. Drs. E. J. Crawford and E. J. Daly appointed Medical Officers, Nigeria and Gold Coast respectively. Dr. J. Jackson-Moore, Senior M.O., Nigeria, appointed Chief Construction M.O., Nigerian Eastern Railway Construction.

### VACANCIES.

BIRMINGHAM AND MIDLAND EAR AND THROAT HOSPITAL.—Junior House-Surgeon (non-resident). Salary at the rate of £200 per annum.

BRADFORD CHILDREN'S HOSPITAL.—House-Surgeon. Salary £100.

BRIGHTON: ROYAL SUSSEX COUNTY HOSPITAL.—(1) Honorary Surgeon. (2) Honorary Assistant Surgeon.

CANCER HOSPITAL, Fulham Road, S.W.3.—House-Surgeon. Salary at the rate of £100 per annum.

CHESTER: GRAYINGWELL MENTAL HOSPITAL.—Junior Medical Officer. Salary £450 per annum.

CITY OF LONDON MENTAL HOSPITAL, near Dartford.—Junior Medical Officer. Salary £350 per annum, or £400 if possessing Diploma in Psychological Medicine.

DERBY: DONOTCH MENTAL HOSPITAL.—Locumtenent (male). Salary 7 guineas a week.

GLAMORGAN COUNTY COUNCIL, Cardiff.—Dental Surgeon. Salary £500 per annum, rising to £700.

GONDON HOSPITAL, Vauxhall Bridge Road, S.W.1.—Resident House-Surgeon. Salary £75 per annum.

GREAT YARMOUTH HOSPITAL.—House-Surgeon (male, unmarried). Salary at the rate of £150 per annum.

HAMPSHIRE GENERAL AND NORTH-WEST LONDON HOSPITAL, Haverstock Hill, N.W.3.—(1) Casualty Medical Officer. (2) Casualty Surgical Officer. (3) House-Physician. (4) House-Surgeon. Salary at the rate of £100 per annum each.

HENEL HEMPSTEAD: WEST HERTS HOSPITAL.—Resident Medical Officer. Salary £200 per annum.

HERMITAGE SANATORIUM, Whitwell, I.W.—Resident Medical Officer (male). Salary £350 per annum.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—(1) House-Surgeon. (2) House-Physician. (Unmarried.) Salary £50 for six months.

HULL ROYAL INFIRMARY.—Assistant House-Physician (male). Salary at the rate of £130 per annum.

KENSINGTON, FULHAM, AND CHELSEA GENERAL HOSPITAL, Earl's Court, S.W.5.—Junior Resident Medical Officer (male). Salary at the rate of £75 per annum.

### British Medical Association.

#### CURRENT NOTES.

#### OPENING OF THE ASSOCIATION'S NEW HOUSE BY HIS MAJESTY THE KING.

It is now possible to give further particulars of the arrangements made by the Reception Committee and confirmed by the Council at its meeting on June 10th, for the opening of the New House of the British Medical Association in Tavistock Square, London, on Monday, July 13th, at 3 p.m.

His Majesty the King, who will be accompanied by the Queen, has (as announced in our issue of June 6th) graciously consented to declare the New Building open.

A short dedication service will be conducted at the Gates of Honour by His Grace the Archbishop of Canterbury, who will then open the Gates with the key presented by the Architect, Sir Edwin Lutyens, R.A. Near the Gates will be stands for approximately 200 persons; these seats will be allocated to the relatives of those members of the Association who fell during the great war. Owing to the strict limitation of this accommodation only one seat will be allowed for relatives of each member whose name appears in the *Book of Honour*, and if there are more applications than vacancies there will be a ballot.

A procession will then be formed and proceed through the Courtyard, in which there will be places available for about 100 members of the Association, to the Great Hall. Each medical school in the country will be asked to send one representative student; they will be grouped in the Courtyard. On arriving at the Members' Lounge certain presentations will be made to Their Majesties, and the procession will then pass on to the Great Hall, the doors of which His Majesty will be asked to open with a special key. On reaching the dais in the Great Hall, presentations will be made of representatives of Oversea Dominions and other countries. The Association's Address to Their Majesties will then be read; the King will reply, and will then declare the building open. The procession will leave the platform and Hall, going to the Library, where the *Book of Honour* will be inspected and Mr. F. G. Hallett presented. It is hoped also to have in the Library a few

antiquarian and professional objects of great interest for inspection by Their Majesties, who will afterwards leave by the Courtyard, driving through the Gates of Honour. After the departure of Their Majesties guests will be free to inspect the building, and tea will be taken.

Much attention has been given to making the occasion a great demonstration of the solidarity of the medical profession, as well as a representative gathering of members of the British Medical Association. Limitations of space make it impossible to find seats for more than a small minority of those who desire to witness the ceremony. Invitations have been sent to the Past-Presidents and Vice-Presidents of the Association, to Past-Chairmen of the Representative Body, Past-Chairmen of Council, Gold Medallists, Honorary Members, Past-Secretaries of Annual Meetings, and former central officials of the Association; to representatives of the General Medical Council, the colleges, universities, and medical corporations and medical and allied societies in the British Isles, of European medical societies, of the American Medical Association, and to the heads of the Medical Departments of the Services, to the medical Members of Parliament, and to those members of the Central Medical War Committee who are not included in other categories. The non-medical invitations are to certain Ministers and heads of Government Departments with which the Association is frequently in contact, the High Commissioners for the Dominions, representatives of the City of London, the London County Council, the Borough of St. Paneras, and the City of Bath; to representatives of the Dental Board of the United Kingdom, and certain persons to whom the Association owes special consideration, among whom may be mentioned Lady Horsley, Mrs. G. E. Haslip, and Mrs. Forbes Fraser.

After providing for seats for the Overseas delegates, members of Council and the Reception Committee, and allowing for those invitations which may not be accepted, there will probably remain some 260 seats in the body of the Hall. To fill these, invitations have been sent through their secretaries to all Divisions and Branches in the United Kingdom inviting each of those bodies to send one official representative, who may be either the President or Secretary of the Branch, or the Chairman, Secretary, or Representative of the Division. Any vacancies left by the

inability of the Divisions to send such official representatives will be allotted, with any remaining seats, to members of the Association, by ballot; and the names of those who apply for seats, and who will not receive invitations otherwise, are being noted for the ballot.

The balcony at the south end of the Great Hall will be allotted to the wives of members of the Reception Committee, of Chairmen of Standing Committees and other members of Council, and of those Dominion representatives who are being presented to Their Majesties. It will thus be seen that apart from relatives of those members whose names are in the *Book of Honour*, there will be at least 150 places to be allotted to members of the Association by ballot, of which probably 100 will be in the Courtyard. It is hoped to arrange that the proceedings at the Gate of Honour shall be transmitted to the Courtyard and the Great Hall by means of loud speakers, and that the proceedings in the Great Hall shall be similarly transmitted to those outside.

In the evening, at 8.30 o'clock, there will be a reception and dance, to which about 1,000 invitations will be issued to those who attended in the afternoon, together with an invitation for a lady, and if there are any vacancies left they will be filled by ballot. Academic dress or uniform, with decorations in either case, will be worn at the afternoon ceremony, and evening dress or uniform, with decorations, at the evening reception.

On the evening of Tuesday, July 14th, the Metropolitan Counties Branch proposes to hold a reception, further particulars of which will be made known later.

#### The British Medical Association: New Address.

The Medical and Finance Departments of the British Medical Association, like the Editorial and Printing Departments of the *British Medical Journal*, have now been removed from 429, Strand, to the new headquarters building of the Association in Bloomsbury. The postal address for all departments is "British Medical Association House, Tavistock Square, W.C.1," and the telephone numbers are Museum 9861, 9862, 9863, and 9864 (four lines, internal exchange). Particulars of the telegraphic addresses will be found in the announcements on the last page of the *Supplement*, immediately preceding the *Diary* of the Association. All communications with reference to advertisements, as well as orders for copies of the *Journal*, should be directed to the Financial Secretary and Business Manager, and all letters intended for the Medical Department to the Medical Secretary, at the new address. The Library of the Association remains for the present at 429, Strand, W.C.2; notice of its removal to the new building will be given in due course.

## Association Notices.

### TABLE OF DATES.

June 27, Sat.	Supplementary Report of Council appears in SUPPLEMENT.
July 3, Fri.	Amendments and riders for issue in A.R.M. Agenda must be received by this date.
July 13, Mon.	Opening of the New House of the British Medical Association by His Majesty King George accompanied by Her Majesty Queen Mary.
July 17, Fri.	Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.R.M., Bath) by this date.
July 18, Sat.	Annual Representative Meeting, Bath.
July 20, Mon.	Council, and Annual Representative Meeting, Bath.
July 21, Tues.	Annual Representative Meeting. Annual General Meeting, Bath, President's Address.
July 22, Wed.	Council, Meetings of Sections, Conference of Honorary Secretaries, Bath.
July 23, Thurs.	Meetings of Sections, etc., Bath.
July 24, Fri.	Meetings of Sections, etc., Bath.

ALFRED COX, Medical Secretary.

### BRANCH AND DIVISION MEETINGS TO BE HELD.

**ABERDEEN BRANCH.**—The summer meeting of the Aberdeen Branch will be held in the Stotfield Hotel, Lossiemouth, at 12 noon on Saturday, June 27th. The meeting will be a joint one with the Northern Counties Branch. Train leaves Aberdeen at 8.5 a.m.

and returns from Elgin at 7.35 p.m. Lunch in the Stotfield Hotel, Lossiemouth, at 1 p.m. Dinner in the Station Hotel, Elgin, at 6.30 p.m.

**BORDER COUNTIES BRANCH: DUMFRIES AND GALLOWAY DIVISION.**—A social meeting has been arranged in the form of a motor trip to Dalry, Galloway, early in July.

**EAST YORK AND NORTH LINCOLN BRANCH.**—The sixty-ninth annual meeting of the East York and North Lincoln Branch will be held at the Grimsby and District Hospital on Friday, July 10th, at 3 p.m., when the President-Elect, Dr. W. Wallace, will be installed as President for the coming year. Business: Annual report and financial statement; election of officers. The President will deliver the inaugural address.

**LANCASHIRE AND CHESHIRE BRANCH: MID-CHESHIRE DIVISION.**—A meeting of the Mid-Cheshire Division will be held in the Board Room of the Altrincham General Hospital on Wednesday, June 24th, at 8.15 p.m. Agenda: To instruct Representative at the forthcoming Annual Meeting. At the close of the business meeting a dermatological lantern demonstration will be given by Dr. Louis Savatard.

**METROPOLITAN COUNTIES BRANCH.**—The annual general meeting of the Metropolitan Counties Branch will be held at the British Medical Association House, Tavistock Square, W.C.1, on Tuesday, June 23rd, at 4 p.m. Business: (1) Report of scrutineer on election of officers; (2) Annual Report of Council; (3) Report of representatives of the Branch on the Central Council; (4) President's address, by Mr. Comyns Berkeley, "Save the women and children."

**METROPOLITAN COUNTIES BRANCH: ST. PANCRAS DIVISION.**—The inaugural meeting of the St. Pancras Division will be held at the Midland Hotel, St. Pancras, on Tuesday, July 7th, at 8.45 p.m. Agenda: To approve the election of officers, representatives, and executive committee; adopt organization rules. Address by Mr. Bishop Harnian, F.R.C.S., on some common eye conditions.

**NORTH OF ENGLAND BRANCH.**—The annual meeting of the North of England Branch will be held at 7, Windsor Terrace, Newcastle-upon-Tyne, on Thursday, July 2nd, at 12.30 p.m. This will be followed by a luncheon, and the annual golf competition will be held at Gosforth Park on that afternoon. Agenda: Election of officers. The following have been nominated by the Branch Council: President, Dr. J. Hudson. Vice-Presidents, Dr. F. Beaton (Ashington) and Dr. T. J. Kirk (Norton-on-Tees). Honorary Secretary and Treasurer, Mr. Norman Hodgson. Honorary Scientific Secretary, Dr. Harvey Evers. Any other competent business.

**NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH.**—The annual meeting of the North Lancashire and South Westmorland Branch will be held at Galgarrth Hospital, Windermere, on Tuesday, June 30th, at 3.15 p.m. Dr. John Hay (Liverpool) will give an address entitled "The significance of raised blood pressure." Members are requested to keep this date free. Ladies are invited.

**NORTHERN COUNTIES OF SCOTLAND BRANCH.**—The annual meeting of the Northern Counties of Scotland Branch will be held at the Stotfield Hotel, Lossiemouth, on Saturday, June 27th, at 12 noon. After the business meeting the members of the Branch will lunch with the members of the Aberdeen Branch, who are holding their annual meeting at the same place and at the same time. Thereafter arrangements have been made for golf on the Lossiemouth golf course and for an excursion to various places of historical interest in the vicinity to be taken part in by both Branches.

**OXFORD AND READING BRANCH: OXFORD DIVISION.**—The next meeting of the Oxford Division will be held at the Radcliffe Infirmary on Wednesday, June 24th, at 2.30 p.m. Agenda: Instructions to Representative to Annual Meeting. Paper:—Dr. F. G. Gardner: "Catarrh an entity?" As the King and Queen are expected to arrive in Oxford soon after 4 o'clock, the meeting will terminate at 3.30. Dr. Ainley Walker's paper is postponed until November 25th.

**SOUTH MIDLAND BRANCH: BUCKINGHAMSHIRE DIVISION.**—The annual general meeting of the Buckinghamshire Division will be held at the Royal Bucks Hospital, Aylesbury, on Monday, June 22nd, at 2.30 p.m. Agenda: Election of officers; Report of Council; instructions to Representative; programme for the year.

**SOUTH-WESTERN BRANCH.**—The eighty-sixth annual meeting of the South-Western Branch will be held at the Royal Cornwall Infirmary, Truro, on Tuesday, June 23rd, at 3 p.m., when Dr. Gordon (President) will resign the chair to Mr. Panting (President-Elect), who will deliver his inaugural address. The report of the Branch Council for the year 1924-25 and the annual financial statement for 1924 will be presented, and the officers for the year 1925-26 elected. Luncheon, by the kind invitation of the President-Elect, will take place from 1 to 2.15 p.m. at the Red Lion Hotel, Truro. Tea will be provided at the Infirmary after the meeting, by the kindness of the members of the West Cornwall Division. The annual dinner of the Branch will be held at 7.15 p.m. at the Red Lion Hotel. Tickets (8s. 6d. each, exclusive of wine) are to be obtained from Dr.

Barnell, 20, Lemon Street, Truro. Early application for tickets will greatly facilitate arrangements, and in any case should be made not later than first post of Saturday, June 20th. Accommodation can be privately arranged for visitors intending to stay the night at Truro, provided notice is received.

**SUFFOLK BRANCH: WEST SUFFOLK DIVISION.**—A meeting of the West Suffolk Division will be held on Tuesday, June 23rd, for the consideration of the Annual Report of Council, which will be presented as follows: Dr. O. R. M. Wood, Preliminary, finance, organization, *BRITISH MEDICAL JOURNAL*; Dr. G. H. Metcalfe, Science, medical ethics; Dr. B. E. A. Batt, Medico-political, Parliamentary elections; Dr. Grace Griffith, National health insurance, non-panel, public health and Poor Law, hospitals, naval and military. A combined clinical and social meeting of the Division will take place on Thursday, August 6th, when Dr. Wood has very kindly offered to entertain the Division once more at Woolpit. Tea in his garden will follow a clinical meeting at the Institute.

**SURREY BRANCH.**—The annual meeting of the Surrey Branch will be held in the Guildhall, Guildford (by kind permission of the Mayor of Guildford), on Wednesday, June 24th, at 1.45 p.m. Agenda: To receive (a) report of the election of new officers, who shall thereupon take office; (b) report of the Branch Council and the annual financial statement. Address by the President, Mr. H. Branson Butler, F.R.C.S.E. The Guildford Division invites members to lunch at the Angel Hotel, Guildford, at 1 p.m. After the annual meeting members will proceed by car to Alton, where Sir Henry Gauvain has invited them to tea at his private clinic at 3.30. Sir Henry Gauvain will afterwards conduct the party over Lord Mayor Treloar Cripples' Hospital (by permission of the Governors). The annual Branch dinner will be held at the Angel Hotel, Guildford, at 7 p.m. (tickets 7s. 6d., exclusive of wine). It is hoped that as many members as possible will stay to the dinner.

**SUSSEX BRANCH.**—The annual meeting of the Sussex Branch will be held in the Blatchington Court Hotel, Seaford, on Friday, June 26th, at 2.15 p.m. Agenda: Correspondence; election of officers; induction of President, who will give an address on some emergencies in general practice; annual report and financial statement; organization rules. The President-Elect (Dr. W. P. Morgan) invites members to luncheon at 1 p.m. Those members intending to be present are asked to notify Dr. Morgan (Sussex Cottage, Seaford) by June 21st. After the meeting members will visit the Seaside Branch of the Chailey Hermitage, and then proceed to the Hermitage at Chingley, where the use of heliotherapy and actino-therapy will be demonstrated. Mrs. Kinniburgh invites the members to tea at the Hermitage. The Seaford Golf Club will welcome members who wish to make use of the links.

**YORKSHIRE BRANCH: SHEFFIELD DIVISION.**—A general meeting of the Sheffield Division will be held at the Church House, St. James Street, Sheffield, on Tuesday, June 23rd, at 8.30 p.m. Agenda: Consider Report of Council (SUPPLEMENT, *BRITISH MEDICAL JOURNAL*, April 11th); instructions to Representatives. Several members have consented to introduce the discussion of important sections of the Council's Report as follows: Medical ethics, Dr. Helm; medico-political, Dr. Forbes; national health insurance, Dr. Mackinnon; public health, Dr. Wynne; hospitals, Mr. A. Garrick Wilson.

## Meetings of Branches and Divisions.

### BIRMINGHAM BRANCH: WEST BROMWICH DIVISION.

The third regular meeting for 1925 of the West Bromwich Division was held at the District Hospital, West Bromwich, on June 9th. The attention of members was called to the advisability of sending patients with errors of refraction to ophthalmologists and not to opticians. In the matter of fees for examination of Territorial recruits, it was unanimously decided to let the present fee stand. The statement that in some areas assistants are paid very small salaries was brought to the notice of members; it was decided that, as far as was known, the statement did not apply in the area of the Division.

It was decided to defer till the next meeting in October the formation of a local Hospital Committee, since a new staff will shortly be appointed to the West Bromwich Infirmary. Any matter requiring attention meanwhile will be dealt with by the Executive Committee.

Dr. A. F. Adamson (Wednesbury, Staffs) was elected Deputy Representative in the Representative Body. A small committee was appointed to arrange a social meeting in October or November. The Annual Report of Council was fully discussed and the Representative was instructed with regard to voting on the various recommendations and amendments. Several interesting clinical cases were also shown.

### METROPOLITAN COUNTIES BRANCH: WEST MIDDLESEX DIVISION.

The annual report of the Executive Committee of the West Middlesex Division recorded an increase in membership—£9 against £5 in the previous year. Five meetings, including the annual general meeting, were held, and addresses were given by representative members of the profession, to whom the Committee expresses thanks. The Committee also records its appreciation of the kindness of the Chairman and Committee of the King Edward Memorial Hospital in allowing the meetings of the Division to be held in the

Board Room of the hospital. The average attendance at meetings had improved, and thus showed an increased interest in the work of the Division. In association with the Harrow Division, a dinner was held in December, when 48 members and guests were present. At the invitation of Dr. J. B. Cook a highly interesting visit was paid to the West Middlesex Hospital at Isleworth, and it is hoped to arrange a visit of a similar nature to another institution during the ensuing year. It is also proposed to hold a dinner in December.

### SOUTHERN BRANCH.

#### Annual Meeting in Jersey.

The fifty-second annual meeting of the Southern Branch was held on June 11th at Bree's Royal Hotel, Jersey, when the President, Dr. HENRY DEVINE, O.B.E., was in the chair.

After the usual business had been gone through and a very cordial vote of thanks to the retiring president had been carried, Dr. Devine vacated the chair in favour of Lieut.-Colonel P. B. BENTLEY, M.B.E., who delivered a most interesting address, which took the form of reminiscences of his forty years' work as a general practitioner in the island. His graphic description of the altered conditions of medical life was much appreciated by his audience, and a vote of thanks was carried by acclamation.

After the meeting the visiting members and ladies were entertained at tea by the President. In the evening a complimentary dinner was given by the Jersey members to the visitors, who were overwhelmed by the lavish hospitality of their hosts. A delightful evening was spent, and regret was expressed that the attendance of members from the mainland was so small. On the following day the visitors were taken to the museum, where they were welcomed by Mr. Edmund T. Nicolle, His Majesty's Viscount of Jersey and Honorary Secretary of the Société Jersiaise, the well known antiquarian and archaeological society of Jersey. Mr. Nicolle and Mr. Sinel, the venerable ex-curator, kindly took charge of the party, and with legitimate pride pointed out the treasures, the most interesting of which was probably the priceless torque of pure gold, weighing 24 oz., and 56 inches in length. This torque is pronounced by experts to belong to the middle of the Bronze Period.

In the afternoon an excursion was made to the "Bon Air" Sanatorium and Convalescent Home, and to a dolmen at Hougue Bic, which was discovered as recently as 1924, beneath a tumulus 35 feet high; a detailed description of this wonderful and ponderous sepulchral structure would take up too much space. The party subsequently proceeded to the Castle of Mont Orgueil, where Mr. Nicolle again acted as host. Tea was generously provided by the Jersey members. All who were fortunate enough to attend the meeting will never forget the warmth of their welcome and the hospitality of the Jersey Division.

### SOUTH-WESTERN BRANCH: TORQUAY DIVISION.

The annual meeting of the Torquay Division was held in the Torbay Hospital on May 13th, when Dr. A. E. CARVER was in the chair. The following office-bearers for the ensuing year were elected:

Chairman, Dr. J. J. S. Scrase (Newton Abbot). *Vice-Chairman*, Dr. W. A. D. King (Paignton). *Honorary Secretary*, Dr. W. Cameron Davidson (Torquay). *Representative in Representative Body*, Dr. H. J. Campbell (Dartmouth). *Deputy Representative in Representative Body*, Dr. D. Wilson (Torquay). *Honorary Auditor*, Dr. J. M. Jarvie (Torquay).

Dr. CARVER, in announcing Dr. King's resignation from the post of honorary secretary, referred to the great amount of work he had done for the Division during his tenure of the office, and a very hearty vote of thanks to Dr. King was adopted with acclamation. Some discussion took place in regard to the question of fees payable for ambulance lectures, etc., and also fees payable to practitioners for street accidents and other emergencies to which they had been called by the police. The provision of some form of social entertainment and a lecture during the ensuing year was approved of, and referred to the Executive Committee for detailed consideration. It was also decided to proceed at once with the revision of the rules of the Division.

### PROPOSED ST. PANCRAS DIVISION.

A MEETING of medical practitioners resident in the St. Pancras area was held at the Midland Hotel on June 5th to consider the formation of a Division of the British Medical Association for the borough area. Mr. BISHOP HAMMAN, F.R.C.S., Treasurer of the Association, was elected chairman of the meeting, which unanimously approved the formation of a St. Pancras Division of the British Medical Association, and the following officers were provisionally elected: *Chairman*, Dr. A. R. Roche, M.C.; *Vice-Chairman*, Dr. Kathleen Lander; *Honorary Secretary and Treasurer*, Dr. P. P. Dalton. *Representative in Representative Body*, Dr. Kathleen Lander. It was decided that the ordinary meetings of the Division should be held on the second Tuesday of each month, and that the first four meetings should be held in the afternoon and in the evening. It was decided that the first meeting should be held at the Midland Hotel on Monday, June 7th, at 8.45 p.m. A copy of the resolution was directed to be sent to the Metropolitan Counties Branch Council with a request that they should be made effective as early as possible. At the close of the meeting the newly elected provisional Executive Committee held a session, when it was decided that the model rules of organization, and the rules governing procedure recommended for adoption by the Council and the Representative Body, together with the list of officers and the Executive Committee, should be submitted for approval at the commencement of the inaugural meeting on July 7th.

## National Insurance.

### ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE.

#### EVIDENCE OF THE MEDICAL PRACTITIONERS' UNION.

On the twenty-seventh day of the meeting of the Royal Commission on National Health Insurance evidence was tendered on behalf of the Medical Practitioners' Union by Dr. E. A. Gregg (President), Dr. Gordon Ward (Chairman of Executive Committee), Mr. S. D. Davis and Mr. Charles Davis (Solicitors), and Dr. A. Welply (General Secretary).

The witnesses stated that the Union had between 3,000 and 4,000 members, about 90 per cent. of whom were insurance practitioners. The Council of the Union, which had drawn up the evidence, was of opinion that it was right and proper for the provision of medical services by the State to extend until the widest possible benefits of preventive and curative medicine were available for those who, without State assistance, would be unable to obtain them. It had no objection in principle to a State service, though it objected to a whole-time salaried service, and saw no reason why a State system should take that form. It was not inevitable that the obvious advantages to the patient and the public generally of private practice should be sacrificed under a State system, witness the medical service under the Insurance Acts itself. The increasing scope of public medical services was recognized by the Union as necessary and inevitable.

#### Extension of Service to Dependents.

Certain anomalies, both of inclusion and exclusion, existed in the present system with regard to the range of persons benefited, and from this the Council of the Union argued that the present basis of national insurance was not sufficiently satisfactory to provide a proper groundwork for the inclusion of dependants as such. Some other method of differentiation was desirable. Moreover, the introduction of dependants as such would bring with it administrative difficulties, degrees of dependency being so many and so varied. The Council, therefore, advocated the abandonment of the idea of including dependants *qua* dependants, and favoured some simpler conception, but stopped short of definite proposals. Asked by the Chairman of the Commission (Lord Lawrence of Kingsgate) whether it was proposed that all classes of the population should be brought in, subject to an income limit, Dr. Ward admitted that an income limit was possibly the only means of drawing the necessary line, but the Union put forward no recommendation on that point.

If there was to be a wider range of persons to be benefited the witnesses expressed the view that the service would be better financed without contributions—that is to say, the cost should be borne by the national Exchequer. This method would spread the incidence of contribution as equitably as any other system, and to the objection that it would remove the element of insurance from the scheme Dr. Ward replied that the moral value of compulsory thrift was hardly worth talking about. Some of the provision might come out of taxes, and persons who did not pay income tax might be subject to a health tax. Part of the expenditure might also be borne by the local rates. The provision of a gratuitous medical service provided out of the Exchequer was no more opposed to public policy than the existing provision of preventive services at the cost of the taxpayer and the ratepayer. Under the system which the Union had in view the potential patient would draw a medical card from the proper local authority, present it to the doctor, who would sign it and return it to the authority, receiving a record envelope in exchange. Practitioners would continue to be paid on a capitation basis on the number of persons on their lists.

#### Approved Societies.

So many criticisms of the approved societies were made in this evidence as to amount to what one member of the Commission termed an indictment. Nothing less was proposed than the abolition of the functions of approved societies in respect to national health insurance. The collectors and distributors, whose work, of course, would still be necessary, should be made directly responsible to the State or to the local authorities, and should operate on a territorial basis. The approved societies should be replaced by a system of territorial committees under the control of the local authorities to administer cash benefits only. Insurance Committees, on the other hand, had justified their continuance, though their membership should be somewhat altered; there should be increased medical representation, and the committees should have a definite status as parts of the county administrative machine, with powers and responsibilities broadly approximating to those of county education authorities. A course of procedure might be sketched whereby, within a certain period, benefits might be equalized, and the change-over effected to the new system. The transition from the old to the wider service might occupy at least five years. The service would then be free, in the sense that medical benefit would not be on a contributory basis, benefit, and might well be collected also to provide unemployment benefit and old age pensions.

It was put to the witnesses by Professor Gray that instead of abolishing the approved societies it would be simpler to repeal Section 26 of the Act (dealing with the securities to be given by the societies), for the witnesses had stated that the way in

which the societies had dealt with this section was in itself ample proof of their essential unsuitness to bear the responsibilities now placed upon them. Dr. Ward, however, declared that there were other reasons for abolishing the societies. This was merely one of the clauses in the indictment. A long verbal duel took place between Dr. Ward and Professor Gray on the merits of the case against the approved societies, and Professor Gray remarked, "You are a very drastic people." He also pointed out that the Insurance Committees, which the witnesses agreed, had done their work in an unbiased and judicial way, consisted in the bulk of approved societies' representatives, to which Dr. Ward retorted that there was a sufficient leaven of doctors and of representatives of local authorities to lead them in the right way.

#### No Limitation of Lists.

Dr. Ward expressed himself in favour of insurance practitioners having an unlimited number of insured persons on their lists. "I will go even further and say that a doctor with a really big list from 3,000 to 4,000 would probably give a more efficient service than with a smaller list." He was pressed as to whether such a number as 6,000 was one to which any doctor could be expected to do justice, and replied, "I am very unwilling to accept any figure. I think the thing should be allowed to work out by the ordinary process of selection by the insured persons of the man they deem efficient. A man may not have got his big list by that method, of course, and I am prepared to see him jumped on." He agreed, however, that above a certain limit there were grounds for anxiety. In reply to Mr. William Jones, he said that the attempt might just as well be made to limit the practitioner's private practice or his appointments as to limit his insurance list. The true limit was provided by nature. He added that his advocacy of unlimited lists was made, not in the interests of the doctor, but in the interests of the patient, who should be allowed to go to the doctor of his choice.

#### Additional and Specialist Services.

With regard to additional services, these might be provided in various ways: by including them as part of the general practitioner service (as, for example, the administration of anaesthetics), or by setting up a parallel service (for example, a dental service), or by providing cash benefits sufficient to allow the insured person to procure the service for himself, or, again, by the provision of public services quite outside the scope of the Acts (for example, venereal clinics).

The Union pressed for the inclusion of dental benefit as a statutory benefit forthwith, but did not wish to offer evidence with regard to other specialist services because it anticipated that it would be some years before these could be brought into operation. It deprecated the creation of a very large body of specialists to which these additional services were likely to tend. The need for eminent specialists like those attached to the great hospitals was not disputed, but the creation of so many whole-time officers in the employment of county and other authorities had not been attended by the success which might have been expected, for the reason that many of these specialists had not been in general practice. When it was better that a particular class of case should be treated at one centre or by one individual, and the creation of a specialist was accordingly necessary, that specialist should be chosen from the ranks of general practitioners, and, where possible, should be a part-time officer. In choosing men for these posts preference would be given to those with knowledge of general practice, and in course of time this requirement might be made obligatory.

#### Maternity Service.

Maternity service was the subject of a long cross-table discussion. In its earlier evidence the Council of the Union expressed the view that reasonably complete facilities were already available, that therefore it was against bringing this provision within the ambit of national health insurance, and that in any case it would be relevant to inquire what purpose would be served by giving all insured women the right to the services of a practitioner during confinement. An extension of the service contemplated would bring the doctor to the bedside in the great majority of maternity cases, whether normal or abnormal. To the abnormal he was already summoned, so that the gain would consist solely in his presence at a very large number of normal cases, and it was doubtful whether there were sufficient doctors to undertake the duties contemplated. In an appendix, however, the Council expressed regret that this attitude had been construed in some quarters as unsympathetic. It had been felt to take too little account of those earnest persons who had accepted the very sweeping conclusions of Dr. Janet Campbell's report to the Ministry of Health and who had been shocked and amazed in consequence. It was admitted that there was room for improvement in the maternity services of the country, and that it was possible that assistance from the national health insurance fund would promote this improvement. This assistance might materialize in various ways: by providing for proper care in some suitable cottage, say, when the home conditions were very imperfect, or by payment for cases in hospital care, consultation services, augmentation of the funds of district nursing associations employing qualified midwives, as well as the existing cash benefit. It was felt, however, that almost every factor was wanting which would make it possible to offer a complete maternity service to insured persons forthwith. The service must be built up deliberately, although with as much speed as possible.

#### Procedure for Dealing with Complaints.

"It is the deliberate and considered opinion of the Union that a great State department, the Ministry of Health, has shown itself to be incapable of appreciating or unwilling to act upon those elementary principles of justice which have made our courts

of justice the pride of all English-speaking peoples." This was the prelude to a long argument in which the Union arraigned the present judicial and disciplinary system, and mention was made of some recent well reported cases. The view of the witnesses was that there ought to be an *ad hoc* tribunal, composed of three persons of standing, one of whom should be the chairman of the Panel Committee, and that this body should deal with all complaints in the first instance. The more trivial complaints, generally based on misunderstanding, could be at once adjusted, while matters requiring more formal investigation should be remitted, if the doctor be the accused, to a judicial subcommittee of the Panel Committee. This subcommittee would sit under the chairmanship of a barrister, taking evidence on oath, and state whether in his opinion the charge was proven or not proven. The findings would go to the Ministry of Health for confirmation, and on such confirmation any penalty imposed by the subcommittee would become operative, but an appeal should lie to the courts. The accused should not be subjected to any further disciplinary proceedings through the agency of the Ministry, and the papers should not be forwarded or the case notified to any other body whatsoever. Asked whether the average doctor was not as well able as the average insured person to look after his own interests before such a tribunal as the medical service subcommittee, Dr. Ward pointed out that the insurance patient had, as a rule, the advantage of an official of the approved society to represent him before the subcommittee; the doctor had no such advantage. Sir John Anderson asked many questions, apparently with the object of getting the witness to concede that the present system was not inequitable and did not result in any substantial injustice. He also criticized the tribunal which the witnesses had suggested in substitution of the medical service subcommittee—namely, a subcommittee of the Panel Committee. He began to wonder where the interests of the insured person came in. The present tribunal, which consisted of members who could be regarded as representative of insured persons and of doctors, with a neutral chairman, was surely a balanced tribunal. Mr. Davis, one of the witnesses, replied that he had the shorthand notes of many cases before medical service subcommittees, and they illustrated how unsatisfactory things were. Professor Gray asked whether it was not according to constitutional procedure that the final decision as to whether a doctor was to remain on the panel should rest with the Minister responsible to Parliament. The Union representatives disagreed with this view, and Dr. Ward said that their complaint was that the Minister had shown himself incompetent. "Even if it be the ordinary doctrine that the Minister is responsible to Parliament and therefore the courts cannot intervene, we say, here is a case for an Act of Parliament to alter that."

#### Representation of Insurance Practitioners.

The witnesses proposed that in place of the present system of representation a statutory national Panel Committee should be set up for England, another for Scotland, and a third for Wales, and a statutory central medical committee be formed consisting of representatives of national committees which would in turn be directly elected from existing Panel Committees. Dr. Ward argued that the Insurance Acts Committee, although it was the executive of the Panel Conference, did not in point of fact carry out what the Panel Conference required. It was a committee of the Council of the British Medical Association, with whose policy and decisions it must be in accord, and it received its instructions from the Representative Body. Asked whether it was not the case that this procedure had been adopted by the resolute of practically all the Panel Committees throughout the country, Dr. Ward said that it had not been adopted, but it had certainly been approved. When the Act came into force the British Medical Association was the only body which counted, and it did an enormous amount of work and undoubtedly deserved well of the profession. The result was that the people who did that work commanded the respect of the profession, and any disapproval of the system was apt to be regarded as a vote of no confidence in them, which vote was not intended.

#### Remuneration.

The representatives of the Union placed before the Commission a system of calculating the capitation fee. The number of insured persons was multiplied by the number of attendances, etc., paid to each; this total of services was divided into visits and consultations; each was multiplied by the current market value, and the cash totals added, and divided by the number of insured persons. This gave a capitation fee of 13s. From a questionnaire sent out, it appeared, on the basis of 305 replies received, that the average gross annual income in urban practice was £1,403, and in rural £1,380. The average practice expenses were £561, or just over 40 per cent. of the average income, the rural practices averaging 5 per cent. more than the urban. The witnesses were asked if, assuming that these figures really represented practitioners' incomes, they thought the country was prepared to agree to an immediate increase of almost 50 per cent. in the capitation fee, to which Dr. Ward replied that the 50 per cent. addition was only on part of the income—the part, namely, derived from insurance practice.

#### EVIDENCE OF THE NATIONAL MEDICAL UNION.

On the twenty-eighth day of the meeting of the Royal Commission evidence was tendered on behalf of the National Medical Union by Dr. Vivian Greenyer and Dr. Charles T. Comber, of its council.

#### Objections to Medical Benefit.

The memorandum of evidence recounted the circumstances attending the inception of national insurance, and stated that the Union, representing that section of the profession which had

refused service under the Acts, had maintained its objections down to the present time. It was the view of the Union that there should be a State service for necessitous persons, and that the Poor Law should be modified on certain lines to admit of this, but the present insured persons, being in no sense necessitous or destitute, should be voluntarily insured in one of the societies which well served the purposes of medical benefit before the national insurance scheme was inaugurated. The Union also considered that in certain respects the system had brought about a deterioration in the efficiency of the general practitioner, while the medical and lay committees, and the mixed professional and lay assessorships, with, above all, the absolute and grotesque power placed in the hands of the Minister of Health, had degraded a liberal profession to the level of a supervised trade. The Union advocated the censorship of the General Medical Council alone, and, of course, in necessary cases submission of the doctor, like other citizens, to the courts; but the removal, root and branch, of other censorship.

#### Alleged Unpopularity of the Act.

Dr. Greenyer stated that the actual membership of the National Medical Union was 247, but a circular letter stating the policy of the Union had been sent to the 6,000 practitioners of the London area, and of 1,333 replies received, 1,306 were in a favourable sense. Dr. Comber said that he worked in a part of London (Catford and Lewisham) which was almost wholly composed of persons of the class from which the insured and their families came, and in his district at least half the practitioners were not on the panel, and they all assured him that they were doing very well. The bulk of their practice was in attending the insured patients of other doctors. An enormous number of insured persons preferred to be attended by non-insurance practitioners or to go to hospital rather than to have the doctor to whose services under the Act they were entitled. In 1922 in London the number of people who had failed to choose an insurance practitioner was 438,000, and it was suggested that this number had not decreased. The witness also urged that the dislike of going to the insurance practitioner accounted for the increased resort on the part of the public to harmful or unsuitable patent medicines.

The narrow range of service to which the insurance practitioner was restricted was also a matter of complaint with these witnesses. If a disease was really serious the patient was mostly transferred to hospital. They cited Sir John Collie as having furnished distinct evidence that there had been an increase of malingering since the Insurance Act came into force.

A statement that insured persons were dissatisfied with the treatment they received drew from the Chairman of the Commission (Lord Lawrence of Kingsgate) the remark that it had been brought out in evidence that the number of complaints to Insurance Committees on the part of patients was exceedingly small in relation to the total number of attendances, and he asked the witnesses what evidence they had to prove the contrary. Dr. Comber replied that it was impossible to get collective statistical evidence on that point, but he could assure the Commission that the cases of dissatisfaction were not "extremely small." He proceeded to give particulars of some cases which had come under his own observation in which there had been dereliction of duty or at least serious inattention on the part of insurance practitioners although no formal complaint had been made. It was difficult to get women especially to make a complaint.

#### The National Deposit Friendly Society.

The witnesses were asked if they had had experience of contract practice before the Act, and, if so, whether they had been quite satisfied with it. Dr. Comber replied that his own experience was satisfactory, but he admitted that this was not the general rule; many features of contract practice were extremely bad both for the doctor and the patient. He held that the aim should be to make the contract directly between the patient and the doctor, without any control by the societies over the doctor as to treatment, the societies only to pay out the liabilities of the patient. In this connexion he praised, as did his colleague, the system of the National Deposit Friendly Society, which represented a genuine system of insurance against doctors' bills, etc., while leaving the profession free to develop on the traditional lines of private practice. The Chairman pointed out that the system of the National Deposit Friendly Society gave the person who was receiving the medical benefit a direct financial interest in going to the doctor as seldom as possible, and asked whether the witness considered that a good thing. Dr. Comber replied that if the patient was ill he would require attendance, but he would not under such a system go unnecessarily. The following dialogue then ensued:

Chairman: Quite so; they have a financial interest in not going to the doctor.

Witness: That is put very crudely, is it not?

Chairman: It is put in the words of the secretary of the National Deposit Friendly Society on a previous occasion. Do you regard that as a good scheme?

Witness: I think it is a very good scheme that they should not have an interest in going unnecessarily to the doctor.

Chairman: Do you think that an insured person can know when it is necessary or unnecessary?

Witness: No; that should be for the doctor to say.

Chairman: He has to go to the doctor to find out?

Witness: Yes.

Chairman: So that you cannot choke them off in that way.

The Chairman mentioned cases which had suffered through lack of timely diagnosis, and suggested that these cases would constantly be forthcoming if insured persons had no financial interest in not going to the doctor.

Dr. Comber was then put through a close examination on his views as to the character of insurance practitioners. He admitted

that the large majority of them were honourable men, "but you must remember that at the commencement of the Act all the 'rubbish' went on because there was nothing to stop them."

Chairman: All the "rubbish" were in the profession. You must not attribute the "rubbish" to the Act, they were there, and had been through the course of training through which all doctors go.

Asked later whether the whole of their evidence did not boil down to this, that they wanted, as far as the medical side was concerned, the repeal of the Act, and a return to the administration of medical benefit by voluntary societies, Dr. Greenyer said that that was not their intention. They were trying only to release the profession from any Government control whatever so that patients could have real freedom of choice. Mr. William Jones referred to the opposition of the profession to some social legislation in the past, and said:

"Having regard to that, do you think we can accept, without reservation, medical evidence, and especially the evidence that you have placed before us this morning?"

Dr. Greenyer: We leave that to the Commission.

### THE SCOTTISH MEDICAL GUILD.

Professor William Russell, Vice-President, and Dr. Frederick Porter, Honorary Secretary, of the Scottish Medical Guild, next gave evidence. The evidence was on similar lines to that already given by the National Medical Union, though, said Dr. Porter, "we might have stated it differently." The view of the Guild was that State provision ought to be made for medical attendance for all manual workers who applied on the ground of inability to make provision for themselves, that in the case of colliery workers and others among whom a system of capitation payments had been in existence before the passing of the Act this system might be continued, but that manual workers in good and regular employment who previously had been attended as private patients ought to be free to make their own medical arrangements individually or as members of the non-State section of such a body as the National Deposit Friendly Society.

### Opposition to the Act in Scotland.

It was stated that the Scottish Medical Guild represented about 700 non-insurance practitioners in Scotland. A census taken in Edinburgh recently showed that non-insurance practitioners were attending over 30,000 insured persons, from 10 to 40 per cent. of the total number.

Dr. Porter said that in Edinburgh there had been a 'good deal of opposition on the part of the medical profession to the Act, and in that city there was a smaller number of doctors on the panel relatively than in other places. But he also read a letter from a Glasgow non-insurance practitioner who stated that 17.8 per cent. of the patients whom he had attended during the past year were insured persons, and that of the patients now insured who were patients of his before the introduction of the National Insurance Acts about 80 per cent. had remained with him as private patients. It was suggested to the witnesses, who did not agree, that a good deal of the opposition in Edinburgh was the work of the medical profession, and was not due to any defect in the Act itself. Dr. Porter replied that Edinburgh non-panel men had sacrificed their living for their principles. They might have gone on the panel "and made thousands a year out of it."

Mr. William Jones: They do not make thousands a year.

Witness: Thousands a year, sir.

Mr. Jones: Allow me to say that they do not make thousands a year. I signed the cheques for a large number of practitioners over a number of years.

Witness: I know that if I had gone on the panel I should have taken £2,000 a year out of the money.

Mr. Jones: You would have been lucky. . . . They would have been larger than any of the cheques I signed myself.

Professor Russell said that the Insurance Act had encouraged the chemist to buy a cheap class of drug; and Dr. Porter said that the chemist could not make insurance dispensing pay if he kept the best quality of drugs for his insured customers.

Professor Gray, in a question, suggested that this statement was not consistent with facts that were very well known and could be fully inquired into.

Professor Russell, before leaving the witness chair, made a reservation on behalf of himself and all members of the Guild to the effect that they were perfectly aware that there were many medical men on the panel who did their work most conscientiously, but his experience was that a great deal of the work was unsatisfactory.

### AN EAST END PRACTICE BEFORE AND AFTER NATIONAL INSURANCE.

Dr. Harry Roberts of Stepney gave some interesting personal evidence before the Royal Commission on National Health Insurance on the twenty-eighth day of its sitting.

He stated that his practice in the East End of London, which dated back from before the days of the Insurance Act, was a very large one, and at present, in conjunction with three partners, and with the help of an assistant and the supplementary help of a dentist, a masseur, and nurses, he was responsible for the medical attendance of nearly 10,000 insured persons.

Previous to the passing of the Act he attended very much the same people as afterwards. In his district it was clearly impossible for the majority of patients to pay an adequate fee for medical attendance; consequently it had been necessary, before national insurance was introduced, to attend an enormous number of individuals and to work fairly continuously day and night for

seven days a week in order to obtain a reasonable professional income. The better type of slum practice in the old days was largely dependent for its efficiency upon the philanthropic zeal and abnormal energy of the doctor. With the passing of the Act and the consequent bringing up of the rate of payment for attendance somewhat nearer to the rate customary in ordinary artisan districts, a new situation was created, which in his own case made it practicable—the bulk of his private patients remaining with him as insured patients—to reorganize his work as to gain greater leisure for himself and to provide an altogether fuller medical service. Accordingly he took three men into partnership and engaged the other assistants just mentioned, so arranging matters that each of those concerned in the practice was able to work to a time-table, and the patients were provided with special services not previously possible. There was no change in the personal relations between himself and his patients, and he thought the same was true of other practitioners. In 93 per cent. of the cases the relation between doctor and insured patient was a cordial one, with a genuine sense of responsibility on the one side and of confidence on the other.

The Chairman (Lord Lawrence of Kingsgate): That is a fine testimonial to the insurance medical service, is it not?

Dr. Roberts: I think, on the whole, in my personal experience, the relation is, if anything, a little closer. The loyal ones add pride to their loyalty. They say, "Here is my doctor," whoever he may be. There is also a little bit of partnership about it, implying, I think, a degree of cordiality even greater than it was before the Insurance Act. It is certainly not less; that is my experience.

Dr. Roberts also said, in reply to Sir Arthur Worley, that he had no knowledge of any large number of insurance patients going to non-insurance practitioners. There was nothing of that kind in his district.

### Defects in the Working of the Act.

Dr. Roberts went on to comment on the slightness of the personal relation between insured persons and their approved societies. Upwards of 50 per cent. of the people had not the slightest idea to what society they belonged. He had never heard an insured person speak of his society in a filial way. It was generally thought of as a "blend of Scotland Yard and the board of guardians." Nearly all insured persons were ignorant, not only of the general principles of the Act, but of the regulations of the societies, and consequently of the rights and benefits to which they were entitled and the penalties to which they might be subject. A grave defect from more than one point of view was the disenfranchisement to medical benefit following upon persistent unemployment. It seemed absurd that a certain measure of poverty should be necessary to entitle a person to medical benefit, while a still further measure of poverty disenfranchised him. Other matters which interfered with the utility of the present medical service were the limitation of medical benefit to certain members of a family only, the limitation of provided medical treatment to such as was assumed to be within the range of an average general practitioner, and the general neglect of insurance committees to make use of their powers to organize the public education of the people in the laws and principles of health.

With regard to record cards, Dr. Roberts thought a system of record-keeping was absolutely essential, but it was not possible to carry on with the system provided for insurance practitioners. He did not think that the doctor with a big list found the provided record card of the slightest use. In the witness's view the patient was the person who should have possession of the record card and should bring it with him.

Dr. Roberts was asked for his views on the big proposal which had been put before the Commission that medical benefit should be taken out of the insurance scheme and co-ordinated with all the other local health activities, the whole system being administered by a single local health authority in each area. He replied that he had a fairly open mind about that. He felt that there was a big case for discriminating between the personal care of health—and especially the remedial treatment of disease—and what he might call the sanitary provisions of the local authorities. "I would like to see all the personal remedial side of health brought under one authority, and I would like that to be either an improved insurance committee or a new county health committee as originally suggested by Mr. Lloyd George."

### Attitude of the Profession to the Service.

In reply to Sir Andrew Duncan, Dr. Harry Roberts said he did not think there was any strong anti-panel feeling in the medical profession. The men who were hostile were a very small number, but they were a section which had been rather active lately in the journalistic way. The most severe critics of the panel system were in London, but from his own personal acquaintance with London insurance practitioners he could say that their general attitude was one of considerable seriousness towards the whole business of medical attendance on insured persons. Theirs was not at all a flippant attitude; it was friendly to the patient and entirely responsible. Among his own medical neighbours—his competitors, if that word were preferred—he found a very much higher standard of technical knowledge and of academic achievement than was possessed by the men who were his neighbours before the Insurance Act. They were much more numerous and they were much better qualified, and in conversation they were obviously much better informed technically.

Much of Dr. Roberts's evidence was made up of illustrations of the extraordinary errors and perversities of approved societies in dealing with particular individuals. Some of the instances given were very amusing. The Chairman said that the Commission was much obliged to Dr. Roberts for his interesting evidence.

## CRITICISMS OF THE INSURANCE SERVICE.

Evidence was also tendered by Lieut.-Colonel W. Bickerton Edwards, C.B.E., M.D., late R.A.M.C., who criticized the national health insurance scheme on several grounds. One of the grounds was that popularity—by which he meant the popularity of a particular doctor—had produced large lists, but that popularity was not synonymous with efficiency. Another was that, being an under-paid service, it induced medical men to take on more work than they could efficiently carry through. Other criticisms were the lack of specialist services, the absence of definite facilities for institutional treatment, the large amount of clerical work imposed upon the insurance practitioner, and the fact that the practitioner, however able, had nothing to look forward to except remaining an insurance practitioner. The witness suggested a scheme whereby each area would have its area hospital with resident medical officer, groups of such hospitals being linked up with a base hospital having more extended provision, and that a general practitioner should be able to have a case removed to such a hospital immediately if it was likely to benefit thereby. He also urged the better payment of insurance practitioners and the granting of opportunities for post-graduate study. Insurance practitioners' work should be subject to inspection, but the inspectors might perhaps be elected by the practitioners themselves. He also proposed that a body of experts should be appointed to report on any overlapping in the present medical services, and he made certain suggestions for the amendment of the Workmen's Compensation Act.

## Work and Status of the Insurance Practitioner.

In the oral examination of Colonel Bickerton Edwards, the Chairman of the Commission (Lord Lawrence of Kingsgate) took up one of his statements which implied that the insurance practitioner might have a visiting list of 50 to 100 a day and might see 50 to 60 patients twice a day in his consulting rooms. The Chairman said that on the basis of careful calculations made by the Ministry of Health and submitted in evidence, the lowest figures of 50 visits and 100 surgery attendances a day would correspond to a list of about 13,000 persons, whereas the maximum number allotted to any insurance practitioner was 2,500, and 65 per cent. of all the insurance practitioners in the country had lists of less than 1,200 insured persons. Colonel Bickerton Edwards said that he could not controvert the statistics, but he knew that a man with a list of 1,500 might have in winter-time in an epidemic a visiting list of 50 a day. The witness also said that he thought free choice of doctor a "bogy," though he believed the whole medical profession was committed to it. Personally he did not attach very much value to that principle. He thought far more was made of it than it merited. The insured person would not lose much if he had not the choice of doctor.

The conditions of insurance practice, according to this witness, left very small opportunities for self-improvement. Some of the finest doctors, he knew, were insurance practitioners, but knowing what he did of the life of an insurance practitioner he did not think that any man would care to stick to it always. Having used the word "intolerable" to describe the life of the insurance practitioner, he was asked why it was more intolerable than private general practice, and replied that insurance practitioners were more hardy worked. He wanted insurance practitioners to have the opportunity of promotion to the status of consultants. In a proper system of national service, examinations might be devised through which, if a man was capable of doing his work properly, he should merit promotion.

The thirty-first meeting of the Royal Commission on National Health Insurance was held at the Home Office on June 11th, Lord Lawrence of Kingsgate in the chair.

Evidence as to the nature, extent, cost, and administrative arrangements of optical and ophthalmic treatment of insured persons was given by the Joint Council of Qualified Opticians, represented by Mr. J. H. Sutcliffe, Mr. F. W. Bateman, and Dr. Margaret Dobson; by the British Optical Association, represented by Mr. W. B. Barker, Mr. McHoul, and Mr. Meynell; by the Council of British Ophthalmologists, represented by Mr. E. Treacher Collins, Mr. J. Herbert Fisher, and Mr. M. S. Mayou; and by the Ophthalmic Benefit Committee, represented by Mr. H. L. Eason, C.B., C.M.G., Mr. C. F. Harford, and Mr. G. H. Pooley.

Proof copies of the oral evidence and the relative Statement submitted at the meeting of May 21st, 1925, may be obtained from H.M. Stationery Office, Adastral House, Kingsway, W.C.2, on remittance of cost (2s. 3d.) and postage.

## DANGEROUS DRUGS ACTS, 1920 AND 1923.

The Home Secretary gives notice that he has withdrawn from Dr. Frederick George Lewtas of Cheadle Hulme, Manchester, the authorizations granted by the Regulations made under the Dangerous Drugs Act, 1920, to duly qualified medical practitioners to be in possession of and supply raw opium and the drugs to which Part III of the Act applies. Any person supplying Dr. Lewtas with raw opium or any of the drugs to which Part III of the Dangerous Drugs Act, 1920, applies will be committing an offence against the Act.

## Naval and Military Appointments.

## ROYAL NAVAL MEDICAL SERVICE.

Surgeon Commanders E. S. Wilkinson and W. Bastian have been placed on the retired list, with the rank of Surgeon Captain.  
Surgeon Commander W. E. Gribbell to the *Effiance*.  
Messrs. H. L. Bernstein and J. W. Strong have entered as Surgeon Lieutenants and have been appointed to R.N. Hospital, Haslar.

## ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Lieutenant H. E. Hall to the *Ramillies* for fourteen days' training.

## REGULAR ARMY RESERVE OF OFFICERS.

## ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel E. P. Hewitt, having attained the age limit of liability to recall, ceases to belong to the Reserve of Officers.

## ROYAL AIR FORCE MEDICAL SERVICE.

Wing Commander T. S. Rippon, O.B.E., to Headquarters, Special Reserve and Auxiliary Air Force.

P. D. Barling is granted a short-service commission for three years on the active list as a Flying Officer, with effect from and with seniority of May 25th.

## INDIAN MEDICAL SERVICE.

Lieut.-Colonel C. B. McConaghy is granted leave on average pay for eight months, under Fundamental Rules (March 14th).  
Major W. J. Simpson is posted as Agency Surgeon in Bhopal (March 16th).

## TERRITORIAL ARMY.

## ROYAL ARMY MEDICAL CORPS.

General Hospitals.—Major A. P. Watson, O.B.E., T.D., to be Lieutenant-Colonel and to command the 11th (2nd Scottish) General Hospital, vice Lieut.-Colonel (Brevet Colonel) D. J. Graham, O.B.E., T.D., vacated on completion of tenure.

D. L. Greig to be Lieutenant.

## VACANCIES.

BIRMINGHAM CITY.—Assistant Medical Officer at one of the City Mental Hospitals. Salary £350 per annum, rising to £400.

BIRMINGHAM PUBLIC HEALTH DEPARTMENT.—Assistant Tuberculosis and Sanatorium Officer. Salary £500 per annum.

BLACKBURN AND EAST LANCASHIRE ROYAL INFIRMARY.—Third House-Surgeon (male). Salary £150 per annum.

BRADFORD ROYAL INFIRMARY.—Resident Surgical Officer (male, unmarried). Salary £250 per annum.

CAMBRIDGE: ADDENBROOK'S HOSPITAL.—House-Surgeon (male, unmarried). Salary at the rate of £120 per annum.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE HEART AND LUNGS, Victoria Park, E.2.—(1) Resident Medical Officer. (2) House-Physician. Salary at the rate of £250 and £100 per annum respectively.

CHESTER ROYAL INFIRMARY.—Assistant House-Surgeon (male). Salary £150 per annum.

EAST LONDON HOSPITAL FOR CHILDREN, Shadwell, E.1.—House-Surgeon (male). Salary at the rate of £125 per annum.

EDINBURGH: ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN.—Five Honorary Resident Medical Officers.

ESSEX AND COLCHESTER MENTAL HOSPITALS.—Medical Superintendent at the Brentwood Mental Hospital. Salary £1,000 per annum, rising to £1,250.

GLAMORGAN COUNTY COUNCIL, Cardiff.—Dental Surgeon. Salary £500 per annum, rising to £700.

GREIF YARMOUTH HOSPITAL.—House-Surgeon (male, unmarried). Salary at the rate of £150 per annum.

GREENOCK PARISH COUNCIL.—Locum-tenent Medical Officer for Smithston Workhouse and Asylum. Salary £10 per week.

HEMEL HEMPSTEAD: WEST HEMTS HOSPITAL.—Resident Medical Officer. Salary £200 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.—House-Physician. Honorarium £50 for six months.

LYRDON URBAN DISTRICT COUNCIL.—Assistant Medical Officer of Health. Salary £600 per annum.

LANCASHIRE RURAL DISTRICT COUNCIL AND CONSETT URBAN DISTRICT COUNCIL.—Medical Officer of Health. Salary £800 per annum, rising to £900.

LEICESTER ROYAL INFIRMARY.—House-Surgeon. Salary at the rate of £125 per annum.

LONDON COUNTY COUNCIL.—Assistant Medical Officer (male) at the Maudsley Hospital. Salary £300 per annum, rising to £350.

LONDON JEWISH HOSPITAL, Stepney Green, E.1.—(1) Assistant Surgeon in the Gynaecological Department. (2) Assistant Surgeon in the Ear, Nose, and Throat Department.

MANCHESTER: ANCOATS HOSPITAL.—(1) Resident Surgical Officer (male). (2) House-Surgeon. Salary £200 and £100 per annum respectively.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Assistant Physician.

NEWCASTLE-UPON-TYNE: ROYAL VICTORIA INFIRMARY.—Honorary Assistant Surgeon.

PONTYPRIDD URBAN DISTRICT COUNCIL.—Lady Assistant Medical Officer. Salary £600 per annum, rising to £650.

SHEFFIELD CITY.—Junior Assistant Tuberculosis Officer at Winter Street Hospital. Salary £250 per annum.

STOCKPORT INFIRMARY.—Honorary Radiologist.

SUDIN GOVERNMENT.—Assistant Bacteriologist at the Wellcome Tropical Research Laboratories, Khartoum (unmarried). Initial rate of pay £2,720 per annum, rising to £2,120.

SUNDERLAND ROYAL INFIRMARY AND CHILDREN'S HOSPITAL.—Honorary Surgeon for Nose, Throat, and Ear Work.

SURREY COUNTY COUNCIL.—Assistant Medical Officers in the Public Health Department. Males. Salary £600 per annum, rising to £700.

WAKEFIELD: CLAYTON HOSPITAL.—Male House-Surgeon (unmarried). Salary £175 per annum, rising to £200 after six months.

Printed and published by the British Medical Association, at their Office, Tavistock Square, in the Parish of St. Pancras, in the County of London.

# SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL.

LONDON, SATURDAY, JUNE 27TH, 1925.

#### Preliminary.

##### HONOURS.

202. The Council has pleasure in announcing that during the present session honours have been conferred on the following Members of the Association:—

##### Baronetcy.

Sir John Bland-Sutton, F.R.C.S.

##### K.C.B.

Major-General Samuel Guise Moores, C.M.G.

##### Knighthood.

Mr. James Berry, F.R.C.S.

Dr. Harry Edward Dixey.

Dr. John Robertson, C.M.G., O.B.E.

#### OBITUARY.

203. The following is a supplementary list of Members whose death the Association has to deplore:—

Name.	Offices held in the Association.
Dr. Henry Johnston Boyd	A Member of the Ulster Branch Council; a former Chairman of the Belfast Division.
Dr. Robert James McLean Buchanan	Vice-President of Section of Pharmacology and Therapeutics, 1912.
Dr. Charles Montagu Burton	A former Member of the British Guiana Branch Council.
Dr. James Cameron	A Member of the Glasgow and West of Scotland Branch Council, and a Vice-President of the Edinburgh Branch; a former Chairman of the Lothians Division.
Dr. John Dewar	At one time a Member of the Executive Committee of the Hampstead Division of the Metropolitan Counties Branch.
Dr. Michael Dewar	A former Member of the Council, and of the Insurance Acts Committee; a Member of the Insurance Acts Sub-Committee (Scotland); a former Secretary of the Edinburgh Branch and for many years a Member of the Branch Council; Vice-President of Section of Medico-Sociology, 1912.
Dr. James Don	A Member of the Central Council and of the Central Ethical Committee; a Member of the North of England Branch Council, and for some years Honorary Secretary of the Branch; a former Representative and Chairman of the Newcastle-on-Tyne Division; Vice-President of Section of Otorhino-Laryngology, 1921.

Name.	Offices held in the Association.
Sir Rickman John Godlee, Bart., K.C.V.O.	Secretary 1887, and a Vice-President 1893 of Section of Surgery; Member of Central Medical War Committee.
Dr. Angus Mitheson ...	Vice-Chairman of the Lothians Division of the Edinburgh Branch.
Dr. Wm. Pope Seed ...	A former Member of the West Australian Branch Council, and of the Branch Ethical Committee.
Dr. James Taylor ...	A former Member of the Bath and Bristol Branch Council.
Dr. Wm. Lister Tindle ...	A Member of the Executive and Ethical Committees of the Tyneside Division of the North of England Branch.

Dr. Henry Morton Baker, Dr. Wm. Henry Barnby, Dr. Albert Wm. Beaumont, Colonel James Black, I.M.S., Dr. Richardson Joseph Boustead, Dr. Wm. Percy Blumer, Dr. Robert Nichol Brebner, Dr. Ernest Henry Broek, Dr. Wm. Barnes Buer, Dr. George Clarke, Dr. John Mrie Sloane Duncan, Dr. Herbert Lavington Evans, Dr. Andrew Chalmers Fleming, Dr. Wm. Fowler, Dr. Ralph Holwell Gray, Dr. John James Cecil Hamilton, Dr. Chak Chiu Hung, Dr. Frank Hues, Dr. John James Johnstone, Dr. Dinshah Limji Kaka, Dr. Eustace Julian Keogh, Dr. Frederick Robert Henry Laverick, Dr. Wm. Wntkin Leigh, Dr. Wm. Love, Dr. Armar John McFarland, Dr. James Atholl Campbell MacGrogan, Dr. Peter Douglas McIntosh, Dr. Charles MacLaurin, Dr. Alexander Anderson MacLeod, Dr. Allan Peter McLeod, Dr. Herbert Harold Marsden, Dr. Joseph Aloysius O'Den, Dr. Evan Christopher Prichard, Dr. Harold Victor Sames, Dr. Thomas G. Sullivan, Dr. Carolina Jane Tessier, Dr. Howard Henry Tooth, C.B., C.M.G., Dr. Richard Mahoney Townsend, Dr. Wm. Welsh.

#### ELECTION OF VICE-PRESIDENTS OF ASSOCIATION.

204. The Council is of opinion that to signalise the affiliation of the Canadian Medical Association to our Association and the visit of a strong delegation from the C.M.A. to the Annual Meeting, Vice-Presidents from the Dominion of Canada should be elected, and therefore recommends:—

**Recommendation:** That the following be elected Vice-Presidents of the Association:—Alexander Primrose, C.B., F.R.C.S., M.D., and Frederick Newton Gisborne Starr, C.B.E., M.D., both of Toronto.

Dr. Primrose is an old member of the Association, is Chairman of Council of the Canadian Medical Association, and Dean of the Medical Faculty of Toronto University.

Dr. Starr was Honorary Secretary of the Annual Meeting of the Association which met at Toronto in 1906, and is a prominent and active member of the Executive of the Canadian Medical Association.

#### ELECTION OF HONORARY MEMBER.

205. The Council feels sure that members of the Association generally will agree with the proposal that in recognition of his many services to the profession and to the Association, Mr. Frederic G. Hallett, O.B.E., should be elected an Honorary Member of the Association. During the War Mr. Hallett acted as Secretary of the Committee of Reference and rendered valuable service in his capacity to the Central Medical War Committee. Mr. Hallett's skill as an illuminator has been placed freely at the disposal of the Association on two memorable occasions, first, the Address to Sir Clifford Allbutt on the occasion of his being awarded the Gold Medal of the Association, and, secondly, the design and direction of the Book of Honour and its illumination by Mr. Hallett himself, a task which has entailed many hours of work cheerfully undertaken by him as a labour of love. It is believed that the Association will be glad in this, the only way open to it, to recognise these unselfish and devoted services.

**Recommendation:** That Mr. Frederic G. Hallett, O.B.E., be elected an Honorary Member of the Association.

#### THE SIR CHARLES HASTINGS FUND.

206. The Council has very great pleasure in reporting the generous action of Lt.-Col. J. W. F. Rait, I.M.S. (ret.), and Mrs. Rait in handing over to the Council shares in various companies to the value of £1,065 to form a fund whose primary and principal object is to render financial assistance to individual members of the medical profession who shall be in need of relief or assistance, in order that they may be able, if possible, to continue exercising their profession, but conferring upon the Trustees unlimited powers in

distributing the funds for the benefit of individual members of the medical profession or their dependants as they may think fit. The fund is in no way intended to run counter to the Medical Charities now in existence but to supplement them.

In order that it may be possible to deal promptly with urgent cases, the Chairman of Representative Body, the Chairman of Council and the Medical Secretary for the time being have been appointed Trustees, as all of them are frequently at the Office of the Association and thus would be able to deal at once with claims.

On the suggestion of Lt.-Col. and Mrs. Rait it has been decided that the fund shall be named The Sir Charles Hastings Fund, in memory of the Founder of the Association, and in the hope that a fund so named and with such a purpose may attract to it further donations which may in time make the fund into a powerful agency for good. The Council, on behalf of the Association, has thanked the donors for their gracious action.

#### New House of the Association.

(Continuation of paras. 16-18 of Annual Report.)

207. It is with great pleasure and pride that the Council reports that the Patron of the Association, His Majesty King George V., has graciously consented to open the new House of the Association on Monday, July 13th, 1925, and that he will be accompanied by Her Majesty the Queen. His Grace the Archbishop of Canterbury has kindly consented to dedicate and open the Gates of Honour.

This great day in the history of the Association will, it is expected, be the occasion of a gathering of representatives of every section of the profession which will, it is hoped, demonstrate in a striking manner the representative character of the Association, its world-wide membership, its close ties with the Dominions, Colonies, and Dependencies of the Empire, and its cordial relationship with the great medical organisations in this and other countries. Invitations have been sent to the representatives of the General Medical Council, the Royal Colleges, Universities and Medical Schools in the British Isles, to many of the medical and allied societies in this country and on the Continent, to these Ministers with whom the Association comes most frequently into contact, and to the heads of their staffs, to the High Commissioners for the Dominions, to certain civic representatives, to medical Members of Parliament; to the past Presidents, the Vice-Presidents, Honorary Members, Gold Medalists, Past Chairmen of Representative Body and Council of the Association; to all those who have acted as Honorary Secretaries of Annual Meetings; and to certain others to whom the Association is specially indebted, including amongst others Lady Horsley, Mrs. Forbes Fraser, Mrs. G. E. Haslip, Mr. F. G. Hallett, and the members of the Central Medical War Committee who are not included in any other category. The Overseas Branches of the Association have responded to the special invitation sent to them in a gratifying manner; the Canadian Medical Association is to be represented by seven of its most eminent members, while the American Medical Association will be represented by its President and two, if not three, outstanding members.

#### PRESIDENT'S VISIT TO CANADA AND THE UNITED STATES OF AMERICA.

(Continuation of para. 10 of Annual Report.)

208. The Council feels sure that the Representative Body and members generally will join with it in congratulating the President upon his safe return from his visit to Canada and to the United States of America.

This was the first occasion upon which the Association has been officially represented at the Annual Meeting of the American Medical Association. The President was greatly impressed by his cordial reception in both countries, and has expressed the opinion that it is very desirable that the Association should more frequently than hitherto send accredited representatives overseas.

#### Organisation.

(Continuation of paras. 31-67 of Annual Report.)

##### RULES OF ORGANISATION.

209. The Model Rules of Organisation were amended last year to provide representation, on Division Executive Committees and Branch Councils, of members of the Association employed whole

time in the public health service, and the Council is gratified to report that a considerable number of Divisions and Branches have adopted Rules to give effect to that important principle. A far greater number of Divisions and Branches are now in possession of up-to-date Rules of Organisation than has ever before been the case.

The following Divisions are, however, according to the Register at the Head Office, not yet in effective possession of any Rules of Organisation:—

Banff, Elgin and Nairn; Birkenhead; Bromsgrove; Chester; Crewe; East Cornwall; Glossop; Hyde; Leigh; Monmouthshire; North Lincoln; Shetland; Warwick and Leamington; West Cornwall.

As the work of the Association cannot be carried out with full effect without proper rules, the Council strongly urges the Divisions mentioned to take immediate steps for adoption of Rules based on the Model Rules.

#### HONORARY SECRETARIES WHO HAVE RELINQUISHED OFFICE.

210. Since the publication of the last Supplementary Report of Council (*B.M.J.* Supplement, June 28th, 1924) the following Honorary Secretaries of Divisions and Branches have relinquished office. The Council realises that the success of the Divisions and Branches, and therefore of the Association, depends to a very considerable extent upon the Honorary Secretaries of the local units of the Association, and desires to express on behalf of the Association its grateful thanks to these gentlemen:—

#### (a) Honorary Secretaries of Divisions.

Division.	Name of Secretary.	Year of first appointment.
Argyllshire ...	Dr. J. A. Clarke (deceased) ...	1914
Auckland (N.Z.) ...	Dr. H. G. Rice ...	1922
Birmingham ...	Dr. S. P. Thomson, M.C. ...	1922
Central		
Bishop Auckland ...	Dr. S. V. Tinsley ...	1916
Cambridge and Huntingdon ...	Dr. W. J. Young ...	1924
Chichester and Worthing ...	Dr. H. J. M. Millbank-Smith ...	1918
Crewe ...	Dr. H. J. Stormont ...	1923
East London (S.A.) ...	Dr. E. Gray ...	1920
English ...	Dr. J. W. Adams ...	1922
Finchley ...	Dr. Duncan Cameron ...	1921
Glossop ...	Dr. W. W. Jameson ...	1923
Guernsey and Alderney ...	Dr. R. W. Bollans ...	1914
Guildford ...	Dr. C. d'A. Collings ...	1919
Harrogate ...	Dr. A. Lyndon, O.B.E. ...	1923
Hersham ...	Dr. A. C. Sharp ...	1922
Hyde ...	Dr. J. W. Dew, M.C. ...	1920
Jersey ...	Dr. J. R. Robertson ...	1923
Leicester ...	Dr. A. M. Humphry ...	1922
Liverpool ...	Dr. A. Underwood Millar, M.C. ...	1922
Mashonnaland ...	Dr. E. I. Claxton ...	1921
Mid Essex ...	Dr. Percy Edwards ...	1924
North Lincoln ...	Surg.-Major F. H. Ellis, M.C. ...	1921
Norwich ...	Dr. H. G. L. Haynes ...	1922
Palmerston North (N.Z.) ...	Dr. T. Murray Nowton ...	1923
Portsmouth ...	Dr. I. D. Dickson, M.C. ...	1920
Reading ...	Dr. W. H. Will ...	1922
St. Helens ...	Dr. E. J. Davis Taylor ...	1924
Salford ...	Dr. D. S. Jones ...	1921
Southland (N.Z.) ...	Dr. J. R. Kerr, C.B.E. ...	1924
South Staffs ...	Dr. J. P. Elias ...	1914
South-West Essex ...	Dr. F. O. McGibbon ...	1924
Stratford ...	Dr. H. C. Mactier, M.B.E. (deceased) ...	1911
Surua Vly. (Assam) ...	Dr. A. Todd-White ...	1914
Swansea ...	Dr. J. A. Hill (Asst. Secretary) ...	1924
Swindon ...	Dr. G. C. Ramsay, O.B.E. ...	1923
Taranaki (N.Z.) ...	Dr. U. Urban Marks ...	1921
Torquay ...	Dr. F. C. V. Thompson ...	1924
Warrington ...	Dr. W. P. P. Gordon ...	1924
Wellington (N.Z.) ...	Dr. W. A. D. King ...	1920
West Cornwall ...	Dr. F. R. Ferguson ...	1923
York ...	Dr. J. S. Manson ...	1925
	Dr. E. L. Marchant, O.B.E. ...	1923
	Dr. F. Chown ...	1923
	Mr. J. G. Craig, O.B.E. ...	1919

#### (b) Honorary Secretaries of Branches.

Branch.	Name of Secretary.	Year of first appointment.
Assam ...	Dr. C. E. P. Forsyth ...	1924
Border, S. Africa ...	Dr. J. Barcroft Anderson ...	1916
Dundee ...	Dr. G. Rankine, M.C. ...	1921
Egyptian ...	Prof. Robert V. Dolbey ...	1924
Essex ...	Dr. A. N. Fell ...	1920
Hyderabad ...	Dr. A. N. Fell ...	1920
Konya ...	Lt.-Col. R. W. Knox, D.S.O. ...	1923
Malaya ...	Dr. M. A. L. Sayeed ...	1924
Natal Coastal ...	Dr. C. J. Wilson, M.C. ...	1923
North of England ...	Dr. J. S. Sloper ...	1924
Oxford and Reading ...	Dr. H. H. Tipping ...	1924
Shropshire and Mid Wales ...	Dr. James Don (deceased) ...	1914
South Midland ...	Mr. T. A. Hindmarsh ...	1921
Surrey ...	Dr. E. W. Squire ...	1918
Tasmanian ...	Dr. F. A. Anderson ...	1915
Uganda ...	Dr. A. H. Haydon ...	1922
Western Australia ...	Dr. E. H. Harries-Jones ...	1900
Witwatersrand ...	Dr. C. P. Lankester ...	1914
	Dr. E. Brettingham Moore ...	1918
	Major R. J. A. Maemillan, D.S.O., M.C. ...	1923
	Dr. T. L. Anderson, O.B.E. ...	1922
	Dr. F. to Water, M.C. ...	1922

#### WORK DONE BY THE DIVISIONS AND BRANCHES IN 1924.

(Continuation of paras. 32-33 of Annual Report.)

211. The Council has pleasure in reporting that practically the whole of the Home Divisions and all the Home Branches have reported for 1924. The reports indicate a very satisfactory activity of the local bodies of the Association, more meetings having been held than in previous years (some 40 per cent. of the reporting Divisions have held no less than five meetings during the year). A gratifying feature is the substantial increase in membership reported by many Divisions and Branches, which in a considerable number of cases amount to 25 per cent. or more on the year.

#### PRIZES TO STUDENTS FOR ESSAYS.

(Continuation of para. 38 of Annual Report.)

212. On the award of the examiners, prizes have been given as follows in the Association's Prize Essay Competition for final-year students:—

Mr. F. R. Curtis and Mr. Matthew Masser, both of Leeds University. (There was a tie in this Group and the Prize was divided between the two winners.)  
Mr. J. S. Headrie, Edinburgh University.  
Mr. A. Walker, Glasgow University.  
Mr. R. L. Holt, Manchester University.  
Mr. H. Avrounin, Charing Cross Hospital Medical School.  
Mr. L. Hartstein, London Hospital Medical School.  
Mr. T. O. S. Webb, University College Hospital Medical School.  
Mr. K. S. Smith, Middlesex Hospital Medical School.  
Mr. F. S. Imianitoff, St. Bartholomew's Hospital Medical School.  
Mr. T. M. Ling, St. Thomas's Hospital Medical School.

The Council has tendered its thanks to those members of the Association who have acted as examiners.

213. The Council has decided upon the following subject for the 1925-6 competition:—

"The disabilities that may be directly due to simple fracture (excluding separation of an epiphysis), (a) of the femur, (b) of the tibia, (c) of the fibula, (d) of the tibia and fibula (simultaneously injured), and the means to be adopted in the treatment of such cases in order to prevent or minimise these disabilities."

Arrangements have been made to advertise the coming competition in July, instead of in October, and, as an experiment, a new Group has been formed for the Medical Schools in the British Empire outside the United Kingdom.

#### QUESTION OF A BADGE OF OFFICE FOR DIVISION AND BRANCH OFFICERS.

214. The Council has considered the question of a badge of office for Branch and Division Presidents, Chairmen and Secretaries, and is of opinion that the provision of such badges for these officers is desirable from many points of view. If and when such badges are acquired, they should, the Council considers, remain the property of the Division or Branch and be passed

on to successive officers. Such a badge would probably best, in the case of a Chairman or President, be arranged with a collar of ribbon, so that the Officer could be invested at his inauguration, while the badge for an Honorary Secretary would best be arranged to pin on, so that it could be worn at any meetings at which new members or strangers might be present. The Council has approved patterns as standards for such badges, the cost of such a standard badge for a Chairman or President (silver gilt) being 25s.; and for a Secretary, 21s. The Financial Secretary will be pleased to furnish full particulars on application.

As regards the question of payment for such badges, the Council is advised that their cost cannot legally be met out of the funds of the Association. The Council however hopes that the badges will be provided, either as a personal gift, or by voluntary levy among the members of the Division or Branch concerned.

## Journal.

### SUGGESTED BRITISH JOURNAL OF PEDIATRICS.

215. In consequence of inquiries received from a number of leading teachers in various centres, the Council considered the desirability of the Association undertaking responsibility for the publication of subsidiary journals devoted to special subjects, and in particular of a Journal of Pediatrics which should be fully representative of the work that is being done in Great Britain in that department of medicine.

The Council being of opinion that it is desirable for the Association, in the interests of the progress of medicine, to inaugurate a Journal for the publication of what is best in the British school of children's diseases has arranged for the publication monthly by the Association of such a Journal under the control of the Journal Committee. The new Journal will be directed editorially by a Committee of Pediatricians who are members of the Association, and the Editor of the *British Medical Journal* or his representative will be a member of this Committee.

## Science.

### MIDDLEMORE PRIZE.

(Continuation of para. 79 of Annual Report.)

216. The contributions received in connection with the Middlemore Prize Competition, 1925, were, in the opinion of the Judges, of great merit. The Council has awarded the Prize to Mr. Basil Graves, M.C., for the contribution which he has made to the knowledge of the microscopy of the living eye, especially in relation to the use of the Slit Lamp.

The Council has cordially thanked the Judges—Mr. G. Mackay (Edinburgh), Mr. W. T. Holmes Spicer (London), and Mr. A. L. Whitehead (Leeds), for their valued help in making this award.

### REMUNERATION OF NON-PROFESSORIAL MEDICAL TEACHERS, LABORATORY AND RESEARCH WORKERS.

217. The Council has considered the question of the remuneration of non-professorial medical teachers, laboratory and research workers, and is of opinion that their remuneration should be brought generally into line with the scale of minimum commencing salaries for Public Health Medical Officers, i.e., that a Laboratory or Research Worker or Teacher who has served for three years on a probationary basis at a salary of £300-£350-£500 should receive at the end of that time a minimum salary of £600 per annum (the present Association policy lays down a salary of £500 per annum).

218. The Council has accordingly expressed the following opinion, which will be acted upon pending submission to the A.R.M., 1926, of a recommendation for a rescission of the existing policy. (As the necessary two months' notice has not been given it cannot become the policy of the Association until next year.):

(a) That whole-time (1) non-professorial medical teachers, and (2) medically qualified laboratory or research workers, should be grouped into three grades as defined below, and with the salaries as stated:—

Grade III. Comprising those who are junior workers temporarily employed on probation; no person shall remain in Grade III. for more than three years.

That the minimum salaries for Grade III. shall be as follows:—

1st year ... ..	£300
2nd year ... ..	£350
3rd year ... ..	£500

Grade II.—Comprising laboratory or research workers or teachers, who have had experience in Grade III. or in work of a similar character, and who are permanently and exclusively employed as such.

Grade I. Comprising those of Grade II. whose qualifications or duties justify a position of seniority in status and a higher remuneration.

That the minimum salary for Grade I. shall be £750 per annum.

That after the probationary period (i.e., Grade III.) has been completed, dismissal should be possible only on grounds of neglect of duty, improper conduct or incapacity; and

(b) That non-professorial medical teachers and medically qualified laboratory or research workers holding part-time appointments should receive remuneration, for the time engaged, at the rate of not less than £600 per annum.

### PROPOSED PUBLICATION BY THE B.M.A. OF A BOOK DESCRIBING NEW AND NON-OFFICIAL REMEDIES.

219. There is published yearly by the American Medical Association a book describing the nature and qualities of those new and non-official remedies which satisfy certain conditions defined by that Association. The object which the American Medical Association has in view in publishing its book is to disseminate information among members of the profession in the United States relative to new and non-official medicines and medicinal preparations. For admission to the book any one of these must comply with the Rules of the A.M.A. which prescribe, *inter alia* (i.) that the composition of all articles must be declared; (ii.) that generally speaking articles advertised to the public will not be accepted; and (iii.) that an article will not be accepted concerning which the manufacturer makes unwarranted, exaggerated or misleading statements. The Council understands that the activities of the A.M.A. in this direction meet a real need on the part of the profession in the United States.

The Council is considering a proposal that the British Medical Association should take action on somewhat similar lines.

## Medico-Political.

(Continuation of paras. 93-135 of Annual Report.)

### REMUNERATION OF ASSISTANTS IN GENERAL PRACTICE.

220. Following naturally on the enunciation of minimum salaries for various public health posts, there have come many requests that the Association should do something to improve and stabilise the position of assistants in general practice. This is a matter of some difficulty because circumstances in which assistants are employed vary so much. The Council has no doubt that opinion inside the Association, especially among the younger members, demands that this subject be dealt with. The Council does not propose at the present time to ask the Representative Body to lay down a final and definite policy of the Association on this subject, but rather to formulate certain principles which will serve as guidance to members of the profession who employ, or who act as, assistants. Such a proposition would, after experience, form the basis of a definite policy on the subject.

The Council recommends:—

[Recommendation]—(a) That on general principles the employment in suitable cases of assistants by practitioners is in the interests both of the general public and of the profession;

(b) That it is not desirable for a principal to employ an assistant where he is unable to exercise adequate personal supervision over the latter, e.g., in some types of branch practice. In such circumstances a partnership is to be preferred;

(c) That the offer or promise of a future partnership should not be made a reason for paying a lower salary to an assistant;

(d) That the minimum commencing salary for a newly-qualified inexperienced practitioner, acting as a whole-time indoor assistant to a practitioner, should be £240 per annum, with the addition of board and lodging; and, in the case of such a practitioner, employed on an outdoor basis, the board and lodging value should be estimated from £120 to £160 per annum according to the circumstances of the individual case; that the only exceptions or possible exceptions to the foregoing should be in the case where, owing to arrangements made for study leave, or to physical disability or other reasons, the assistant is not able to give full time to the work;

(e) That a whole-time assistant should be entitled to not less than two weeks' holiday a year on full pay;

(f) That no steps should be taken for the present to make the foregoing expressions of opinion the policy of the Association, but they should be used for the assistance of the office in advising on points connected with the terms and conditions of the work of assistants. Where an advertisement is offered for insertion in the *Journal* in connection with an assistantship not in accordance with the foregoing opinions, the attention of the advertiser should be drawn to them in the hope that the advertisement will be amended; but the advertisement should not, if otherwise eligible, be refused.

#### REMUNERATION OF MEDICAL PRACTITIONERS ENGAGED AT MUNICIPAL MATERNITY HOSPITALS.

221. The Report on the Utilisation of Municipal Hospitals for Civil Needs which was adopted by the Representative Body in 1922 (Mins. 330-3) will be found in pages 152-3 of the Association's Handbook for 1924-25. The Council is of opinion that this policy should include a statement with regard to the payment of medical officers of Municipal Maternity Homes and has drawn up the following paragraphs which it suggests should be adopted by the Representative Body:—

[Recommendation]—That the following paras. dealing with the remuneration of medical officers of Municipal Maternity Clinics be inserted in the Report on the Utilisation of Municipal Hospitals for Civil Needs:—

That where the local authority makes provision for the institutional treatment of maternity cases this should be mainly or primarily for serious cases of ante-natal complications, for cases requiring major obstetric operations, for cases where isolation and treatment of septic infection is specially indicated, and other cases where the home conditions are unsuitable or dangerous for confinements.

That where a general practitioner is called upon to render assistance at a confinement in a Municipal Maternity Hospital the fees payable to such practitioner should be in accordance with the scale of fees approved by the Ministry of Health for the payment by local supervising authorities to medical practitioners called in on the advice of midwives under Section 14 of the Midwives Act, 1918.

That where a consultant is called in by the practitioner in charge of the case the fee for the consultation should be three guineas; that the fee for a major operation should be not less than ten guineas.

#### METHYLATED SPIRIT REGULATIONS.

(Continuation of para. 98 of Annual Report.)

222. The Commissioners of Customs and Excise have submitted to the Association the draft Regulations relating to the supply of industrial spirit to medical practitioners. The main effect of these Regulations is to limit the supply of industrial spirit to medical practitioners to one pint per diem. The Commissioners have given an assurance that though it is essential that it should be made impossible for the spirit to be obtained or used for other than strictly medical requirements, they do not wish to obstruct medical practitioners in getting the spirit, and will give sympathetic consideration to individual practitioners who can show, after trial, that the allowance of one pint of spirit a day is insufficient. The Council has not raised any objection to the draft Regulations.

#### OSTEOPATHY.

223. The Association was recently asked by medical M.P.'s for its opinion in regard to osteopathy, as osteopaths are agitating for legislation to provide for a special qualifying examination to register. The Council expressed the opinion that osteopathy should not be practised by persons who are not duly qualified medical practitioners.

In this connection an article headed "Osteopathy and Chiropractic," and a report with regard to a meeting of Members of Parliament concerning Osteopathy, were published in the *B.M.J.* of 11th April, 1925. At the suggestion of medical Members of Parliament the articles were reprinted and issued to every Member of the House of Commons. Further particulars of the position in the U.S.A. and Canada are being sought from the American Medical Association and the Canadian Medical Association.

#### COMMITTEE *re* SUPPLY OF MORPHINE AND HEROIN TO DRUG ADDICTS.

(Continuation of para. 97 of Annual Report.)

224. The Association has been invited by the Departmental Committee on Drug Addiction to nominate representatives to give evidence before that Committee, and Dr. E. K. Le

Fleming, Dr. C. P. Symonds, Mr. E. B. Turner, and the Medical Secretary have been appointed. The Council has also appointed a Special Committee consisting of the foregoing, with the addition of the Chairman of the Representative Body, Chairman of Council, Dr. J. W. Bone, Dr. G. B. Hillman, and Dr. J. A. Macdonald to advise the witnesses as to the evidence to be given by them.

#### FIRST INTERNATIONAL CONGRESS ON CHILD WELFARE, GENEVA, AUGUST, 1925.

225. The Association has been invited to send representatives to this Conference, which is being held in Geneva on 24th-28th August, 1925, under the auspices of the League of Nations. The Council has authorised its Chairman to invite any member who is attending the Conference, to represent the Association thereat.

#### TONSIL AND ADENOID OPERATIONS AT HOSPITALS.

226. In a number of instances where Education Authorities have arranged for tonsil and adenoid operations on school children at Voluntary Hospitals, the Medical Staffs of such Hospitals are either doing the work gratuitously or at a remuneration which is less than that which the Association has approved (namely, a fee of £1. 11s. 6d. per case for less than four cases; or £5. 5s. per session for not more than eight cases, for the remuneration of surgeon and anaesthetist). Where such arrangements are known to exist it has been decided to ask the Divisions concerned to take the matter up with the Education Authority and with the Staffs of the Hospitals concerned.

#### PUERPERAL MORBIDITY AND MORTALITY.

(Continuation of para. 134 of Annual Report.)

227. The Special Committee which was appointed to consider and report on the causation of puerperal morbidity and mortality and on the administrative action, if any, that should be taken by the Association in connection therewith, has been made as representative as possible. Sir Ewen Maclean, Professor of Obstetrics and Gynaecology in the Welsh National School of Medicine at Cardiff, has been appointed Chairman and Dr. J. W. Bone, Vice-Chairman. The Committee has decided to treat the subject of its reference as one which gives the Association an opportunity of making a practical contribution towards the diminution of puerperal morbidity and mortality, rather than as a discussion of the question of the allocation of responsibility for the present maternal mortality rate. This, though very important, is regarded as secondary and incidental to the more practical object. Acting on the suggestion of the Committee, the Council proposes to promote special researches with a view to determining the factors which constitute, and the conditions which vary, resistance to disease, particularly as regards pregnancy and the puerperium.

It is hoped before long to issue an interim report, which will be submitted to the Divisions and Branches in order to elicit their views which will be submitted to the Committee. It is also hoped to submit the interim report, as revised in accordance with the views of the Divisions, to a special conference of practitioners specially nominated by Divisions for the purpose, to which representatives of bodies specially interested, for example, the Ministry of Health, the Section of Obstetrics and Gynaecology of the Royal Society of Medicine, the Society of Medical Officers of Health, etc., will be invited.

The Council attaches very great importance to this question and believes that the Association can and should make a substantial and practical contribution to its solution. During the next few months it is hoped that Divisions and Branches asking for B.M.A. Lecturers will place this subject in the forefront.

228. The Council has received through the Ministry of Health a letter from the County Councils Association dealing with proposals for investigating maternal deaths in all cases of puerperal fever, all still births and neo-natal deaths. The suggestion had been made by the Ministry in Circular 517 that such investigations, conducted by a competent and experienced medical officer, were desirable. The County Councils Association came to the conclusion that under prevailing conditions it would be impossible for Medical Officers of Health to undertake these inquiries without materially disturbing the amicable relationship with the general practitioner upon the maintenance of which Medical Officers so largely depend for the effective discharge of their duties, and raised the question of the investigations being made obligatory on Local Authorities.

The Council has informed the Ministry that it considers it would be inadvisable to impose such obligatory duties on Local Authorities.

## National Health Insurance.

## ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE.

(Continuation of paras. 139-144 of Annual Report.)

229. The witnesses of the Association (the Chairman of Council, the Chairman of the Representative Body, the Chairman of the Insurance Acts Committee and the Medical Secretary) gave evidence before the Royal Commission on National Health Insurance on April 30th and May 7th, 1925, being assisted by Dr. H. J. Cardale with regard to the special conditions in London, by Dr. J. P. Williams-Freeman on rural conditions, by Mr. N. Bishop Harman on the question of Ophthalmic Benefit, and by Dr. Drer, the Scottish Medical Secretary, who advised on Scottish matters. At the request of the Royal Commission the Association's witnesses invited the Manchester Panel Committee to appoint someone to give evidence upon the special system of payment in operation in Manchester and Salford, with the result that Dr. Stanley Hodgson, of Salford, attended on the second day and gave evidence. A full report of the oral evidence of the Association appeared in the *B.M.J.* Supplements of May 23rd and May 30th.

## DISCIPLINARY MACHINERY OF ACTS.

230. In view of the apprehension felt by insurance practitioners generally as a result of recent decisions of the Minister in a number of disciplinary cases, the Minister of Health has been requested to meet the Insurance Acts Committee for the purpose of discussing the whole question, and has consented to do so on June 18th. (For report of Deputation, see page 290.)

231. Members will doubtless have observed from the *B.M.J.* Supplement of May 23rd that the Minister of Health has, as a result of the Committee's efforts, given instructions that no further deductions are to be made from the remuneration of the two doctors concerned in what has become known as the "Lancashire £1,000 case." The Association has been thanked by the doctors and by the Panel Committee concerned.

## WIDOWS', ORPHANS', AND OLD AGE CONTRIBUTORY PENSIONS BILL.

232. Certain provisions of the Widows', Orphans', and Old Age Contributory Pensions Bill not only make it more difficult to alter the definition of insured persons under the National Health Insurance Acts (a point of great interest to the profession and one on which the Association has expressed a definite opinion before the Royal Commission on National Health Insurance), but will bring into Health Insurance others who have ceased to be insured persons or have been excluded from health insurance under previous Acts. The Council is taking steps to represent to the Minister of Health and to Medical Members of Parliament that the new Bill should be amended in both the above respects.

## OPHTHALMIC BENEFIT.

(Continuation of para. 150 of Annual Report.)

233. It was stated in paragraphs 140-150 of the Annual Report that some Approved Societies in the past have given as an additional benefit what is styled "optical benefit" under which they referred those members requiring spectacles to opticians, and that the Association, in conjunction with the Council of British Ophthalmologists, had approached the Ministry of Health with a view to securing that schemes for the so-called "optical benefit" should provide for insured persons obtaining advice and treatment from ophthalmologists and not from opticians. The reasons stated by Societies for employing opticians and not ophthalmologists are that they could not afford to pay the fees of the latter, and that in any case ophthalmologists who would undertake the work were not numerous enough, or properly distributed throughout the country, for the purpose.

234. The efforts of the Association during the past twelve months have resulted in the compilation of a list of some 550 ophthalmologists who satisfy the following criteria and are willing to see insured persons at the reduced fee of £1. 1s.:

(a) That he has held hospital or other appointments affording special opportunities for acquiring special skill and experience of the kind required for the performance of the service rendered, and has had actual recent practice in performing the service rendered or services of a similar character, or

(b) That he has had special academic or post-graduate study of a subject which comprises the service rendered, and has had actual recent practice as aforesaid, or

(c) That he is generally recognised by other practitioners in the area as having special proficiency and experience in a subject which comprises the service rendered.

Copies of the list have been supplied to many Approved Societies, and some of these are already making use of it.

235. Since the second valuation of Approved Societies, now approaching completion, will largely increase the amount available for additional benefits, and in anticipation that more Societies will offer members benefits connected with the treatment of the eyes, the Association and the Council of British Ophthalmologists jointly urged upon the Ministry of Health the necessity, from the public standpoint, for the employment of ophthalmologists instead of opticians being made an essential part of the Ministry's approval of any such additional schemes. Following various discussions the Ministry submitted the following draft provisions for the observations of the Association, with a view to their being subsequently submitted to the Consultative Council of Approved Societies:—

(1) In all cases the insured person must first consult his panel doctor.

(2) The panel doctor—

(a) if he is satisfied that the case is one only of a simple error of refraction, either prescribes glasses or informs the Society of the necessity for glasses;

(b) if he is doubtful, or if he considers that further medical opinion is necessary, he refers to a specialist on the approved medical list, other than himself.

(3) The above action of the panel doctor is admitted to be within competence of the present contract.

(4) The approved medical list will be drawn up in Insurance Committee areas and maintained by the British Medical Association consisting of persons satisfying the three criteria quoted above.

(5) It will be sent to the Ministry and circulated to Societies and Insurance Committees for distribution to practitioners in their areas—alterations to be similarly circulated.

236. In dealing with the matter the Association was represented by members of the I.A.C. and of the Ophthalmic Committee, assisted by representatives of the British Council of Ophthalmologists and of the Ophthalmic Benefit Committee, a body which more particularly represents junior ophthalmologists and refraction assistants.

237. The Ministry was informed that while appreciating the interest the Ministry was taking in the matter and its attempts to bring about an understanding between the profession and the Approved Societies in regard to a matter of very great importance, the Association could not accept paragraphs (2) and (3) above, mainly because of what might flow from the acceptance of (2) (a). Under that paragraph the practitioner would have to satisfy himself that the case was one of simple error of refraction, that is to say, an error which would justify him (not being an expert) in prescribing glasses or suggesting to the Society that the provision of glasses (presumably by an optician) would meet the case. Also, the practitioner, not being possessed of expert knowledge, would be taking a great responsibility inasmuch as he might be wrong in his diagnosis of a "simple error of refraction," and the case might turn out to be something much more serious.

238. The Ministry was further informed that the Association could not accept the position that a registered medical practitioner should in any way lay himself open to the charge of recommending an insured person to be treated by an unqualified person, and that the recommending of glasses, which could only be fitted after examination by an optician, would be equivalent, in the opinion of the Association, to the "covering" of unqualified practice.

239. The Council therefore suggested the following in place of the above paragraphs 2 (a) and (b):—

If the insurance practitioner from his general examination of the patient concludes that the symptoms found arise from defect of the eyes, or call for examination and report upon the eyes, he should so inform the Approved Society, and recommend that the Approved Society should refer the patient to an ophthalmologist upon the approved list,

which, if adopted, would place the onus of using the optician instead of the ophthalmologist on the Approved Society, would enable the Society to use any specialist on the list, and would allow the insured person to have some choice of specialist, not excluding his own insurance practitioner if he happened to be on the list.

240. After further discussion between representatives of the Association and the Ministry of Health, the latter informed the Council on April 25th, 1925, (1) that the suggestions of the Association had been placed before the

Consultative Council of Approved Societies, when the Societies were strongly urged to recognise the danger to individual insured persons which might arise if ophthalmic treatment or optical appliances were supplied without the advice of a properly qualified medical man, (2) that there was a strong body of opinion among Societies in favour of the employment of specialists, and no special difficulties were encountered with regard to the proposals, on the understanding that the certificate or recommendation which the insurance practitioner would give was to be treated as part of his obligation under the terms of service. The Council has agreed to the scheme in this form.

241. The scheme (which is expected to operate from July, 1925), will provide that, except in the case of repair or renewal of an appliance, an application for the benefit shall not be entertained by the Society unless the applicant has obtained and furnished to the Society a written recommendation from a duly qualified medical practitioner with respect to the benefit.

242. The policy of the Association is that ophthalmic benefit, being of the nature of medical benefit, should be administered by the same body and under the same conditions as ordinary medical benefit is administered and not by Approved Societies as at present, and evidence to this effect has been given by the Association before the Royal Commission on National Health Insurance. Pending new legislation, if any, giving effect to such representations, the Council has deemed it desirable to endeavour to bring the present situation as nearly as possible into line with what it considers to be essential in the public interest. The list of Ophthalmologists which has been compiled by the Association has been furnished to the Ministry which will circulate it to the Approved Societies.

#### NATIONAL INSURANCE DEFENCE TRUST.

243. The audited statement for the year 1924 of the above Trust, of which the members of the Insurance Acts Committee for the time being are Trustees, is appended hereto for the information of the Representative Body and members generally. (See Appendix.)

#### Public Health and Poor Law.

(Continuation of para. 106 of Annual Report.)

##### FOOD COMMITTEE: DIETARY OF THE PEOPLE.

244. The following resolution of the 1924 Section of Public Medicine and Industrial Diseases has been considered by the Council:—

That it be a recommendation to the Council to appoint a Food Committee, on which there should be representatives of the Society of Medical Officers of Health, for the purposes of:—

(1) Conducting an investigation into the adequacy and suitability of the dietary of the people of this country.

(2) As a result of the investigation making such recommendations and drawing up such directions as may appear desirable.

(3) Conferring with the Ministry of Health, the Medical Research Council, and other bodies; and

(4) Dealing with food problems as they arise.

The Council is of opinion that this is a matter which, at the present time, could not usefully be undertaken by the Association. The main reasons which have led to this conclusion are (i.) that an investigation of the nature contemplated in the resolution of the Section would entail far-reaching enquiries and would be very costly; and (ii.) that even if such trouble and expense were incurred it is very doubtful if the public would adopt any suggestions as to diet which might be formulated.

##### WHOLE-TIME PUBLIC HEALTH M.O.s. AND CONSULTING FEES.

245. The A.R.M., 1924, passed the following resolution:—

Minute 153. Resolved: That the Representative Body is of opinion that it is not advisable that whole-time medical officers engaged in public health work should accept fees for private consultations.

The Council has considered several suggestions that the resolution should be rescinded or amended, the main reason given being that the resolution aims at preventing whole-time M.O.s. accepting fees for consultations whilst consultants or specialists who act as part-time M.O.s. in special departments of Public Health Authorities are allowed to accept them. This is considered to be unfair. The Council is of the opinion that the general advisability of the principle enunciated in Minute 153 of the A.R.M., 1924, should be adhered to, but as some misapprehension has

obviously arisen it seems necessary to draw attention to the fact that the conditions of employment rest wholly with the local authority (subject to any control by the Ministry of Health), and that this being so it follows that if a local authority does not object to the receipt of fees by its officers no legal reasons against their acceptance can be put forward by the Association.

##### DEPARTMENTAL COMMITTEE ON FOOD PRESERVATIVES.

246. In giving evidence before the Departmental Committee on Food Preservatives on behalf of the Association Prof. A. J. Clark, M.D., F.R.C.P., pointed out that the present system of allowing almost unrestricted use of food preservatives was very undesirable. He further stated (i.) that food preservatives ought to be used as little as possible; (ii.) that if food preservatives were allowed there should be a legal limit to the quantity permitted, and a requirement that their presence in foodstuffs should be declared; and (iii.) that this declaration was of particular importance to medical practitioners since they had to select diets for patients who might be hypersensitive to these substances. The Association has been informed that it is anticipated that there may shortly be keen Parliamentary controversy on the question of food preservatives. The Public Health Committee is giving special consideration to the draft Regulations as to Food Preservatives which have been issued by the Ministry of Health with a view to giving guidance on this matter.

##### SCALE OF SALARIES FOR PUBLIC HEALTH M.O.s.

247. The scale of salaries for Public Health Medical Officers which the Council on 25th March, 1923, approved, under the authority of Minute 43 of A.R.M., 1923, has been issued together with a covering explanatory letter to Local Authorities and their M.O.H. (excluding those Authorities which only employ part-time M.O.H.) and Education Committees, in England and Wales. The Scottish and Irish Committees have been asked to advise us to the opportune moment for issue of the scale to Local Authorities in Scotland and Ireland. Negotiations are proceeding with representatives of the Local Authorities in Scotland and the Scottish Board of Health. The Council has reason to believe that the approval of the Ministry of Health to the scale as it now stands, together with the qualified approval of the Association of Municipal Corporations, will go far to recommend the scale to progressive health authorities. The fight is by no means over, but with the support of the Branches and Divisions of the Association and that of the Society of M.O.H. and the Medical Women's Federation, the Council believes that a scale which it considers to be eminently moderate as well as logical cannot fail ultimately to secure the support of all concerned and will thus be the means of improving the status and prospects not only of those who in future join, but also of all those members of the profession who are at present engaged in, the Public Health Service.

#### Hospitals.

(Continuation of para. 170 of Annual Report.)

##### PAYMENT OF MEDICAL STAFFS OF HOSPITALS IN RESPECT OF ACCIDENT CASES.

248. In view of the fact that in many instances the owners of vehicles in accidents are covered by insurance, including insurance of third party risks, the Council is of opinion that there should be some arrangement for the payment of medical staffs of hospitals, for attendance on such accident cases treated in hospitals.

[Recommendation]—That in all cases of accident where medical attendance is given at a Voluntary Hospital, and such medical attendance is covered either directly or indirectly by insurance, the Hospital Authorities should recover from the Insurance Company the full cost of maintenance and treatment of such patient. That where patients who would ordinarily be considered as private patients are admitted to hospital solely on account of accident or emergency they should be considered as "private patients."

##### CASE SHEETS OF HOSPITAL PATIENTS.

249. The policy of the Association on the "Standards for Hospitals (England and Wales) with 100 or more Beds," adopted by the A.R.M. in 1924, contains the following paragraph:—

(h) In every such hospital, case records should be kept in respect of every patient, and these should be signed by the member of the staff responsible for the case; these records should be filed and indexed by a competent clerk; every effort should be made to obtain the subsequent medical history of each patient,

and the Council is of opinion that the Representative Body should make a pronouncement on the question of the custody of, and access to, these records.

## Supplementary Report of Council.

[Recommendation]—That case sheets and records of patients treated in hospitals should remain in the custody of the hospital; that they must be regarded as confidential documents and access to them allowed solely to the members of the Visiting Staff of the hospital.

## REMUNERATION OF VISITING CONSULTING STAFFS OF POOR LAW INFIRMARIES.

250. As the employment of consultants and specialists by Guardians for attendance at Poor Law Infirmaries is increasing, the Council considers that the Association should have a policy as to the remuneration of such practitioners. Steps are being taken to draw up such a policy. In the meantime it is important that any arrangements adopted locally should be experimental and subject to revision at the end of a year.

## HOSPITAL SAVING ASSOCIATION.

251. This is a contributory scheme operative in London, and subject to it being amended in the two following respects does not violate the Association's policy:—(i.) The scheme at present contains no stipulation that contributors when attending hospital should take with them a letter from their individual private practitioner, and (ii.) the Hospitals which receive contributions from the scheme in respect of patients are not informed that these contributions, in addition to including payment for the maintenance of such patients, include provision for the remuneration of the medical and surgical staff of the hospital concerned with the treatment of these patients. The attention of the Hospital Saving Association is being drawn to these points, and it is being pointed out that in the opinion of the Association neither the patient nor the doctor concerned gets the full value of consultations either at hospitals or elsewhere unless there is proper exchange of information and opinions between the medical men concerned. Unless the Hospital Saving Association can see its way to remedy these defects the Association will feel obliged to oppose the scheme. Steps are also being taken to inform Hospital Staffs and individual medical practitioners of the policy of the Association in this matter.

## Medical Benevolence.

252. The Council has given careful consideration to the following Minute 52 of the Annual Representative Meeting, 1924:—

52. Resolved: That it be an instruction to the Council to examine and report upon medical benevolent funds, including the possibility of a British Medical Association Benevolent Fund.

The medical charities at present in existence are (1) the Royal Medical Benevolent Fund, (2) the Royal Medical Foundation of Epsom College, (3) the Royal Medical Relief of Widows and Orphans of Medical Men (which takes more of the nature of a provident than of a charitable organisation), (4) the Society for the Relief of Medical Officers' Benevolent Society, and a few localised societies of which full particulars are not available. The Association has, for a considerable number of years, supported the three first named institutions by acting as an agent for the collection from members of the Association of subscriptions and donations to those institutions, but the amount so collected is, relatively to the membership of the Association, trifling.

253. The work of the existing benevolent organisations has been without doubt of high practical value, and much of it has been accomplished by voluntary and comparatively unorganised effort. It has included both the supply of relief to members of the profession or their families who have fallen on evil days and also the provision of educational facilities for children left without parental support. All this work, however, has been limited by lack of funds, and it is generally admitted that if the claims for help are to be adequately met much more money must be raised from the profession, for it must not be forgotten that a not unimportant share of the present funds comes from the laity. The need is great and urgent and the present means of meeting it are quite insufficient.

254. The Council has carefully compared two possible courses, namely (1) to attempt to secure increased support for the existing organisations, and (2) to propose the institution of a new benevolent fund to be organised under the direction of the Association. A new fund would mean one more competitor in the field of charity and would necessarily entail new charges for administration and other expenses. Moreover, the existing organisations already have the machinery needed for investigation and distribution purposes, and any allied directions have been issued. A considerable part of the work of the Association is therefore of a financial nature, and it is against the wiser plan is to

attempt to gain greater interest in and support for funds already in existence.

255. For the Association to continue as at present to act as a mere passive collector of contributions for present funds will obviously leave the position unchanged. On the other hand, were an Association Medical Charities Committee set up and directed to apply itself through the established machinery of the Association to the accurate and repeated introduction to the profession of the actual needs of the situation, it is reasonable to expect that there would be a proportionate response. The sums so collected would form a fund which would doubtless be distributed at the discretion of the Committee here contemplated while, at the same time, leaving full freedom to each contributor to earmark his contribution for any individual end he may desire. By the adoption of such a method the Association would officially identify itself with the effort to meet the position of medical confrères with whom fate has dealt hardly, and would encourage and support the praiseworthy labours of those already working to this end.

The Council therefore recommends:—  
That the Council be instructed to set up a British Medical Association Charities Committee to be constituted and directed according to the following provisions:—

British Medical Association Charities Committee.

1. The Committee shall consist of the Officers of the Association ex-officio, three members appointed by the Representative Body and three members appointed by the Council, together with the Editor, the Medical Secretary and the Financial Secretary.
2. It shall be the duty of the Committee through the machinery of the Association to direct the attention of members to the financial and educational positions which arise as a result of misfortune falling on members of the profession and to appeal for contributions to meet these positions.
3. All sums obtained in response to such appeals shall be paid to a Charities Trust Fund, the Trustees being the Members of Council for the time being in office, and shall be distributed to such medical benevolent organisations and the Trustees shall deem advisable.
4. Contributions paid to the Fund may at the will of the donor either be left to the discretion of the Committee or earmarked for a particular purpose.

## Naval and Military.

(Continuation of paras. 171-183 of Annual Report.)  
RETAINED PAY OF MAJORS R.A.M.C.

256. The Council reported in the Annual Report (para. 182) on the position of retired pay of Majors, R.A.M.C. The Council has since inquired of the War Office whether Officers who joined the Corps prior to the Warrant of 1919 have lost the right to the minimum pension after 20 years' service of £1 per diem, which was one of the chief attractions when they joined the R.A.M.C. The War Office was specially asked for a reply to the above question in time for the meeting of the Council on June 10th, but the Secretary of State has invited a deputation from the Association to meet him on July 30th. A further report will be made at the A.R.M.C.

## Scotland.

MINIMUM SCALE OF SALARIES FOR PUBLIC HEALTH OFFICERS.  
(Continuation of para. 185 of Annual Report.)

257. At an interview on June 5th between representatives of the Scottish Committee, of the Scottish Board of Health, and of Scottish local authorities, the applicability of the Association's Scale to Public Health Medical Officers in Scotland was further considered. Representations were made on behalf of the local authorities as to certain points in which they believed that the Scale was not fairly applicable to Scotland, and the further consideration of the matter was adjourned.

## SCOTTISH HOUSE OF THE ASSOCIATION.

(Continuation of para. 189 of Annual Report.)  
258. The Council is pleased to report that the new premises of the Association in Scotland (6, Drumshough Gardens, Edinburgh) were opened by the Secretary for Scotland (Rt. Hon. Sir John Gilmour, M.P.) on June 4th. The proceedings under the Chairmanship of Dr. C. E. Douglas, Chairman of the Scottish Committee, were most successful. The ceremony was attended by representatives of the Universities and medical corporations and societies in Scotland, and by theatives of the Association from all over Scotland, and by the

Chairman of the R.B., the Chairman of Council, the Treasurer, and the Medical Secretary. The premises are commodious and in every way worthy of the growing importance of the Scottish office, and already several medical associations have signified their intention of holding their meetings at the office. The Council has tendered to the Scottish Committee, to its Chairman, and to the Scottish Medical Secretary cordial congratulations on the successful inauguration of what promises to be a great development of the work and status of the Association in Scotland.

### Ireland.

(Continuation of para. 193 of Annual Report.)

259. The Council understands that the Irish Committee is of opinion that the arrangements made by Dr. Hennessy, the Irish Medical Secretary, for his attendance at the Dail will not interfere with the discharge of his duties as Irish Medical Secretary. The Council has approved of the position so far as it stands at present, and will further consider the position next year in the light of the next twelve months' working of the arrangements.

### Oversea Branches.

(Continuation of para. 201 of Annual Report.)

#### ACTIVITIES OF OVERSEA BRANCHES.

260. The Reports received from Federal Committees and Oversea Branches again show a splendid record of activity on behalf of the profession in the great self-governing Dominions and the other parts of the Empire overseas. The following points are taken from the Reports as being of general interest:—

#### Africa.

261. The work of the South African Committee, under the Presidency of Dr. Campbell Watt, has covered a wide field. The Committee has given evidence before the Hospitals' Commission appointed by the South African Government; has strenuously resisted before Parliament certain clauses in the Mental, Dental and Pharmacy Bill; has organised a new Branch at Port Elizabeth and is organising one for the South-West Protectorate; and has dealt with other important questions of propaganda and organisation. The Council has informed the Committee that it will welcome the assumption of further duties by the Committee towards the South African Branches, analogous to those performed by the Council of the Association in this country.

Congratulations are due to the Cape of Good Hope (Eastern) Branch for the successful organisation, by the Branch, of the 19th South African Medical Congress. The Branch reports a successful year in other directions and has increased its membership by nearly 40 per cent.

The Cape of Good Hope (Western) Branch held during the year a series of attractive meetings of a clinical nature in association with other professional societies in the Branch area, with resulting increased attendance and enthusiasm in the discussions. The Branch membership shows a satisfactory increase.

The Witwatersrand Branch has held no fewer than 14 meetings, which have been well attended by the Branch members.

The Egyptian Branch has been reorganised during the year and has held four successful meetings.

The Kenya Branch has increased its membership by nearly 50 per cent. and has given considerable attention to matters affecting the Medical Services in the Branch area.

#### Australasia.

262. The Australian Federal Committee, under the Presidency of Sir George Syme, has dealt during the year with many matters of great importance to the profession in Australia, and it is only possible to allude here to the more important matters which have engaged its attention. The Council is glad to note that among the personnel of a Royal Commission appointed to inquire into the questions relating to the preservation of the health of the people of Australia are Sir George Syme, Dr. R. H. Todd and Dr. F. S. Hume, all tried workers for the Association in Australia. Reference has already been made in the Annual Report of the Council to the presentation by the Committee of a Presidential Chair for use in the Association's new house. Among the other matters dealt with may be mentioned:—

(i.) Propagation of a scheme for submission to the Royal Commission on National Health Insurance concerning the establishment of a Commonwealth Health Insurance Department to effect the insurance of all persons with income below a prescribed amount against accident and all

sickness; (ii.) preparation of a Report and expression of opinion by the Federal Committee on the subject, on the co-operation of the profession in Australia with the Commonwealth Health Department; (iii.) preparation of draft model form of agreement between industrial hygiene medical adviser and employer; (iv.) formation of a Medical Insurance Company for the Australian profession with similar constitution to that of the Australasian Medical Publishing Company; (v.) publication of a popular monthly Medical Journal for lay readers; (vi.) preparation of a policy governing the conditions of medical service in public hospitals. A further development on which the Council would like to offer its congratulations is the establishment of a new and complete plant and equipment for the publication of the Medical Journal of Australia.

The New South Wales Branch reports another most successful year, having held 19 meetings and increased its membership by nearly 100. Although the activities of the Branch cover a wide medico-political field, the scientific side of its work is well maintained, a new feature being the formation of Sections for special branches of medical knowledge. A résumé of the Branch activities for the year appeared in the *B.M.J.* Supplement of May 23rd, 1923.

The Queensland Branch has taken definite steps as regards its incorporation and is the first body to do so under the new Regulations. A number of matters of importance to the profession have been dealt with by the Branch, including especially questions in connection with country hospitals. A record of 11 meetings, 6 meetings of the Council of the Branch, and an increased membership complete a satisfactory year's work. The Western Australian Branch reports 10 meetings mostly of a scientific character, an increase in its membership and a satisfactory financial position, the Branch funds amounting to some £1,300.

The members of the Victorian Branch have presented Sir George Syme, as a mark of the high esteem in which he has long been held by the profession in Victoria, with his portrait painted in oils, and the Branch contemplates establishing a George Adlington Syme Prize in Clinical Surgery. The home Association is specially interested to note that the Branch is building new premises, the foundation stone of which was laid with due ceremony in November last. The report of the Branch covers a vast field of important matters dealt with during the year. Interesting features are the holding of the first Annual Conference of the Branch and the work carried out by a special committee into the conditions of midwifery work in Victoria.

The South Australian Branch has instituted a medal for presentation to those who deliver the Listerian Oration.

The Tasmanian Branch held no fewer than 13 meetings, and is now forming Divisions for the more effective organisation of the Branch area.

The New Zealand Branch reports another successful year. The Branch has given considerable attention to the preparation of a hospital policy for New Zealand and is acting on the Report, which contains many important provisions, as a basis for consultation with the Health Department in the event of legislation arising. The Australian Federal Committee has invited the Branch to hold the next Australasian Medical Congress in Dunedin in 1927 and the invitation has been cordially accepted. Much scientific work has been dealt with by the Branch, including preparation of a report on the question of anesthetic mortality. The establishment of a Medical Agency, an increased membership and improved financial position are further points in the year's work.

#### Asia.

263. The Mesopotamian Branch has been much concerned with the conditions of medical service in Iraq owing to the changes which have taken place in the form of Government. The Branch has interviewed the Colonial Secretary (Mr. Amery) on the position.

The Ceylon and Hyderabad Branches held many scientific meetings during the year; the former body has under consideration the establishment of a Section of Research. The South Indian and Madras Branch has increased its membership by 25 per cent.

The Annual Meeting of the Malaya Branch has again been of an ambitious character, extending over three days. A report of the proceedings, which were of considerable interest, appeared in the Supplement of June 13th.

The Council takes this opportunity of congratulating the Hong Kong and China Branch on the successful Medical Conference which it recently organised in Hong Kong. Over 200 attended the Conference.

R. A. BOLAM,  
Chairman.

## PROCEEDINGS OF COUNCIL.

Wednesday, June 10th, 1925.

A MEETING of the Council of the Association, the last to be held at 429, Strand, took place on Wednesday, June 10th. Dr. R. A. BOWMAN (Chairman of Council) presided, and the others present were:

Mr. J. Basil Hall (President), Dr. H. B. Brackenbury (Chairman of Representative Body), Mr. N. Bishop Harman (Treasurer), Mr. C. P. Childe (Past-President), Dr. R. Wallace Henry (Immediate Past-Chairman of Representative Body), Dr. C. O. Hawthorne (Deputy-Chairman of Representative Body), Dr. G. A. Attan, Dr. T. Ridley Bailey, Surgeon Rear-Admiral Sir Percy Bassett-Smith, K.C.B., C.M.G., R.N. (ret.), Dr. H. S. Beadles, Dr. J. W. Bone, Dr. H. C. Bristowe, Dr. G. F. Buehan, Dr. H. G. Dain, Dr. J. S. Darling, Dr. C. E. Douglas, Mr. T. P. Dunhill, Mr. W. McAdam, Dr. C. E. S. Flemming, Dr. F. J. Gomez, Dr. T. W. H. Garstang, Dr. J. Giusani, Dr. F. R. Fothergill, Dr. T. W. H. Greenlees, Colonel C. B. Heald, Dr. G. B. Hillman, Dr. R. Langdon-Down, Dr. David Lawson, Dr. R. W. Lestie, Sir Richard Luce, M.P., K.C.M.G., C.B., Dr. A. Lyndon, Dr. J. A. Maedonald, Dr. S. Morton MacKenzie, Major-General Sir William Macpherson, K.C.M.G., A.M.S. (ret.), Dr. R. B. Mahon, Dr. A. Maunknell, Dr. Hugh Miller, Dr. G. W. Miller, Dr. Christine Murrell, Mr. A. W. Nuthall, Lieut.-Colonel O'Kinealy, C.I.E., C.V.O., I.M.S. (ret.), Dr. William Paterson, Dr. R. C. Peacocke, Dr. F. Radcliffe, Lieut.-Colonel J. F. Rait, I.M.S. (ret.), Dr. C. Sanders, Mr. H. S. Sontar, Dr. John Stevens, Dr. W. F. Thomas, Dr. G. Clark Trotter, Mr. E. B. Turner, Sir Jenner Verrall, Dr. J. F. Walker.

*Personal.*

Mr. Basil Hall (the President) was warmly greeted on his return from Canada and the United States. He spoke in appreciative terms of his visit, and said that the Ontario Medical Association, whose annual meeting he attended, had been much impressed by the action of the Council in sending an official representative, so much so that it was worth considering whether a representative should not be sent each year to the principal gathering of the medical profession in Canada. It had been brought home to him that the Association took a wise and timely step last year in taking up the question of affiliation with the Canadian Medical Association (of which the Ontario Medical Association is a constituent body). He also spoke in equally happy terms of his visit to the annual meeting of the American Medical Association in Atlantic City, and promised a fuller report at the next meeting of Council.

The Chairman announced that since the last meeting of the Council one of its members who had endeared himself to his colleagues by his unassuming presence and unselfish work had passed away. Dr. James Don was greatly missed in the North Country, where few men had exercised so much influence, in a quiet way, in the profession. He spoke of the loss of James Don with particular grief as a personal friend. A vote of condolence was carried by the members standing.

The congratulations of the Council were voted to the five members of the Association who figured in the recent Honours List—namely, Sir John Bland-Sutton, Bt., Major-General Sir Samuel Guise Moores, K.C.B., Sir James Berry, Sir Harry Edward Dixey, and Sir John Robertson.

The Medical Secretary reported that a very pleasant function had recently taken place in Wales, when a presentation of his portrait in oils was made to Dr. W. E. Thomas by the practitioners of Glamorgan. He (Dr. Cox) attended by invitation, and he took the liberty before a very distinguished audience of associating the Council with the good wishes which were offered to Dr. Thomas, and he was sure that in doing so he had the acquiescence of all the members. (Applause.)

It was agreed to recommend to the Representative Body that Dr. Alexander Primrose, Chairman of Council of the Canadian Medical Association, and Dr. F. N. G. Starr, a prominent member of the executive of that body, both of Toronto, be elected Vice-Presidents of the Association. The Chairman remarked that this was a very felicitous proposal in view of the recent affiliation. Dr. Starr, who was Honorary Secretary of the Annual Meeting of the Association in Toronto in 1906, had personally presented the flag commemorating Toronto which was to hang in the Great Hall.

In proposing that it be recommended to the Representative Body to elect Mr. Frederic G. Hallett an honorary member of the Association, the Chairman reminded the Council of Mr. Hallett's most skilful and otherwise uncompensated services in connexion with the illumination of the *Book of Honour* and of the Address presented to the late Sir Clifford Allbutt. Mr. Hallett had also rendered other services to the Association. The recommendation was agreed to with applause.

\* See BRITISH MEDICAL JOURNAL, June 13th, 1925, p. 1103

*Representatives at Congresses.*

It was reported that the Chairman appointed Dr. F. Howard Humphris of London to represent the Association at the fourth International Congress on Thalassotherapy, held at Arcachon in April, and Dr. A. A. Martin of Eastbourne at the International Congress, held at Paris in May, on the use of Esperanto in the pure and applied sciences. Dr. A. F. Tredgold had been appointed to attend the International Prison Congress in London in August.

The Council appointed Mr. Bishop Harman, Dr. Dain, Dr. Flemming, and the Medical Secretary as representatives to attend the Imperial Social Hygiene Congress at Wembley in October—a congress arranged by the British Social Hygiene Council, lately the National Council for Combating Venereal Diseases. The question of appointing a representative to attend the International Medical Congress of Industrial Accidents and Diseases, to be held at Amsterdam in September, was considered, and it was left with the Chairman to ascertain if, among certain members specially interested in this subject, one of them was intending to go to this congress and would be willing to represent the Association. An invitation to appoint delegates to attend the Association. An invitation to appoint Congress in Pietermaritzburg at the beginning of July had regretfully to be declined, because it came too late for any arrangements to be made.

*The Sterilization of the Unfit.*

The opinion of counsel (Sir Travers Humphreys) on the legal position with regard to the sterilization of the unfit, which had been obtained pursuant to a resolution of the Council, came up for consideration. (The case put to counsel and the opinion obtained is printed at page 286.) Dr. Fothergill drew attention to the fact that Lord Riddell, in a recent paper before the Medico-Legal Society, had put forward an opinion contrary to certain respects to the one now given by Sir Travers Humphreys, so far as the sterilization of persons of full reasoning power was concerned, and he urged that publication of this opinion of counsel be withheld until the subject had been further explored. Dr. Brackenbury desired that publicity should be given to the document, which he thought useful within the narrow range of the reference, though at the same time he held that it had been abundantly proved that sterilization for mental deficiency and allied conditions was a futile procedure; it did not remedy the social consequences which it was supposed to remedy. Sir Jenner Verrall thought that the opinion of a lawyer of such great distinction as Sir Travers Humphreys should be published. Dr. Maedonald was anxious that if the opinion was published it should be made plain that the Council had not expressed assent or dissent, but had simply passed on the opinion of the barrister who had been consulted.

It was agreed that the document should be published in the JOURNAL, though not as an appendix to the Supplementary Report of Council, and the Editor was asked to make it plain that the document must not be taken necessarily to represent the opinion of the Council.

*A Fund for Members in Need of Financial Assistance.*

The Chairman drew attention to the fact that a member of the Council, Lieut.-Colonel J. W. F. Rait, and Mrs. Rait had made a gift to the Association of certain shares and investments with the object of creating a fund the income from which was to be applied by the trustees to benefiting members of the medical profession who were in need of relief or assistance in order that they might be able, if possible, to continue exercising their profession. The trustees appointed under a deed which had been drawn up by the Solicitor for the purpose of carrying out the wishes of Colonel and Mrs. Rait were the Chairman of Council, the Chairman of the Representative Body, and the Medical Secretary. It was the desire of the donors that the primary object of the fund should be as stated, of carrying out the wishes of the donors that it should be used for medical charities, but the trustees had unlimited powers to distribute the funds for the benefit of individual members of the profession or their dependants as they might think fit. He had suggested to Colonel Rait that it would be suitable to associate such a very excellent departure with his own name and that of his wife, who were the benefactors, but with characteristic modesty Colonel Rait had declined, and had asked that it should receive the name of the "Sir Charles Hastings Fund," after the founder of the Association. The donors had expressed the hope

\* Ibid., May 2nd, 1925, p. 842.

other sources, thereby  
for giving help in  
the Council were due to  
had the greatest possible  
of thanks to them for their

with loud applause.

that he had asked in the first place  
of himself and his wife, to found  
in the names of Dr. Bolam and Dr.  
Cox, both of whom had done and were doing so much for the  
medical profession. But he received a letter from Dr. Cox  
saying that both Dr. Bolam and himself thought the money  
could be used to better advantage in the way now proposed.  
He and his wife would have liked, in order to avoid publicity,  
to have made this little fund effective at their decease, but  
there were two things which had influenced them in creating  
the fund at the present time. One of them—to mention a very  
personal matter—was that his wife had passed through a  
critical illness, and, humanly speaking, had been saved by his  
colleagues in the profession. Another reason which had in-  
fluenced them was the address which Dr. Cox gave at York  
in October last in which he spoke about medical charities. It  
had been a genuine pleasure to promote this little benefaction.

#### Medical Benevolent Funds.

Dr. Hawthorne brought forward the report of the Medical  
Benevolent Funds Committee, to which had been referred the  
instruction to the Council by the last Annual Representative  
Meeting to examine and report upon medical benevolent funds,  
including the possibility of a British Medical Association  
Benevolent Fund. He pointed out that the Association had for  
a considerable number of years supported the principal medical  
charities. During the five years 1920-24 it had raised for the  
Royal Medical Benevolent Fund a total sum of £4,657, and for  
Epsom College £2,668. The work of the existing organiza-  
tions had been of great practical value, but it had been limited  
by lack of funds; much more money ought to be raised for  
these purposes from the profession. The committee had con-  
sidered two possible courses: (1) to attempt to secure increased  
support for the existing organizations, (2) to institute a new  
benevolent fund to be organized under the direction of the  
Association. A new fund would mean one more competitor in  
the field of charity, and would necessarily entail new charges  
for administration. The existing organizations already had  
the machinery needed for investigation and distribution pur-  
poses. The wiser plan was to attempt to gain greater interest  
in and support for the funds already in existence. But this  
ought not to mean that the Association remained a mere passive  
collector of money. The committee accordingly proposed that  
a Medical Charities Committee be set up and directed to apply  
itself through the established machinery of the Association to  
the accurate and repeated introduction to the profession of the  
needs of the situation. The sums collected by this means would  
form a fund to be distributed at the discretion of the contem-  
plated committee, with full freedom, of course, for each con-  
tributor to earmark his contribution for a special purpose. In  
this way the British Medical Association would officially  
identify itself with the effort. He moved that such a committee  
be set up, and that all sums obtained in response to appeals be  
paid to a Medical Charities Trust Fund and be distributed to  
such organizations and in such amounts as the committee,  
subject to the approval of the trustees, should deem advisable.

Dr. J. F. Walker expressed himself disappointed that the  
committee had not come out strongly on the side of a British  
Medical Association Fund. There was no question as to the  
need of some further fund in connexion with medical bene-  
volence. A definite Association fund would be good propa-  
ganda, which would increase the reputation of the Association.  
The Royal Medical Benevolent Fund obtained subscriptions  
from only 7 per cent. of the profession. The starting of a  
medical benevolent fund would be a real landmark in the  
progress of the Association. Dr. Beadles spoke in the same  
sense, and urged that the Association should have its own  
fund, as did Mr. Souttar, who, however, desired that along  
with the Association fund support should be continued to the  
older funds. The Treasurer said that it was a question  
whether the Association was not bound to possess a fund in  
view of the terms of the Clifford Allbutt bequest of £50 for  
what was specifically described as a "British Medical Bene-  
volent Fund."

Dr. Brackenbury held that Mr. Souttar's suggestion was  
impracticable. If the Association started its own fund  
regardless of existing funds it would have to concentrate on  
that fund and care nothing about the others. It seemed to him  
that the committee's suggestion offered a very happy solution.  
It put the Association, in effect, in possession of a fund which  
would be at its own disposal, but which in a general way would  
be for helping the existing funds. He suggested that the

instruction might be widened so that the sums could be dis-  
tributed, not only to medical benevolent organizations, but  
in such other ways as the permanent committee might deem  
advisable. Was it not better to have a fund in the hands of the  
Association, used primarily and mainly, though not altogether,  
in connexion with the existing medical charities, than to start  
in antagonism? Mr. McAdam Eccles pointed out that the  
Royal Medical Benevolent Fund and the Epsom College  
Foundation had a considerable proportion of lay subscribers; he  
did not know whether the Association could hope to secure  
such lay support.

The Chairman said that he had a good deal of sympathy  
with the point of view put forward by Dr. Walker, but it was  
desirable to call attention to the fact that within the last  
twelve months there had been a change in the atmosphere in  
which this subject was enveloped. On the committee of the  
Royal Medical Benevolent Fund five representatives of the  
Association now had seats. Surely it was wiser to preserve the  
assets of these older bodies, to feed them with funds, but to  
leave the distribution of those funds to the various charities  
at the discretion of the committee it was proposed to set up,  
this discretion being subject, of course, to earmarking by the  
donors.

Dr. Hawthorne said he thought it only right to make cordial  
and generous acknowledgement of the work, both on the  
financial and administrative side, of the Royal Medical Bene-  
volent Fund. He agreed with Dr. Brackenbury that there was  
no halfway house on this matter. The Association must take  
either one course or other. His own view was that the best  
practical solution was to organize a committee which would  
enlighten and stimulate the profession and at the same time  
exercise a real amount of control as to how the money so  
collected should be distributed.

The Treasurer said that in the case of the Royal Medical  
Benevolent Fund the greatest care and energy were exercised  
in the disbursement of the moneys. The weakness of that charity  
was the relatively small amount of money it obtained from the  
profession. Sir Jenner Verrall said that the essence of the  
question was whether there was such dissatisfaction with the  
Royal Medical Benevolent Fund that it was necessary for the  
Association to declare war upon it; he would like the Fund  
to be given a further trial. Dr. Lyndon also thought that a  
friendly gesture might be made. With five representatives of  
the Association on the governing body matters should prove  
satisfactory.

The motion to set up the committee and to give it the  
necessary powers was agreed to, and an alteration of phrasing,  
on the suggestion of Mr. McAdam Eccles, was accepted by  
Dr. Hawthorne, whereby the word "medical" before  
"charities committee" was deleted, so as to prevent any  
possible confusion with what the layman knew as "medical  
charities"—that is, charities giving medical help to the  
public.

#### Organization and Membership.

Dr. Morton Mackenzie, Chairman of the Organization Com-  
mittee, reported that the membership of the Association stood  
at 29,117, or 2,000 higher than at the corresponding date in  
1924. It would be very gratifying if on the occasion of the  
opening of the new premises it was possible to announce that  
the membership had reached 30,000. It had to be remembered,  
however, that the number of newly qualified men was likely  
to show some diminution (judging from the entries of students  
in recent years), and therefore further recruitment would have  
to be to a larger extent among the older members of the  
profession. In that connexion the new premises would be a  
great help.

Dr. Mackenzie went on to state that every Branch had  
reported for the past year, that the Branch arrangements were  
working well, and that there was increased activity on the part  
both of Branch and Division secretaries. Branches were being  
financed as liberally as possible with due regard to the Associa-  
tion's funds. The *Handbook for Recently Qualified Medical  
Practitioners* had proved a great success; the first edition was  
practically exhausted, the number of copies sold was 2,200, and  
the publication had paid for itself at once. A new edition  
was now being prepared. It had been decided to advertise  
the following subject for the next prize essay competition for  
final-year medical students:

"The disabilities that may be directly due to simple fracture  
(excluding separation of an epiphysis) (a) of the femur, (b) of  
the tibia, (c) of the fibula, (d) of the tibia and fibula (simul-  
taneously injured), and the means to be adopted in the  
treatment of such cases in order to prevent or minimize  
these disabilities."

He recommended to the Council—and it was agreed—that in  
the grouping of universities for this competition a new group  
should consist of the medical schools in the Empire overseas.

*Badges of Office.*

With regard to a suggestion made at the last Conference of Secretaries that it would be advantageous if officers of Branches and Divisions had a badge provided for them, Dr. Mackenzie said that a badge was certainly useful as a means of identifying the secretary, especially at functions attended by non-members, and it was an aid to dignity in procedure for the president of a Branch and the chairman of a Division to be similarly distinguished. The question was whether the provision of these badges could be made legally out of the funds of the Association. The opinion of the Solicitor was that this was not a lawful expense. Accordingly he moved a resolution that the Council regard sympathetically the proposal to obtain badges and draw the attention of Branches and Divisions to the terms on which, through the Central Office, these might be procured, in the hope that they would be provided either as personal gifts or by a voluntary levy on members, seeing that they could not be legally provided out of the official funds.

Dr. Brackenbury was doubtful as to the correctness of the Solicitor's opinion. He was inclined to believe that expenditure of this kind, however difficult it might be to draw the line, was legitimate expenditure. Dr. Wallace Henry also thought that, while it might not be a necessary expense, it was a proper expense, and, therefore might well come out of official funds. The Treasurer said that unless there was some definite control over the expenditure of Divisions and Branches the whole economic position of the Association might be jeopardized. Dr. Lyndon contended that By-law 28 gave Divisions absolute power to purchase badges. Dr. Stevens hoped that if badges were employed they would be of a stereotyped pattern; it would be unfortunate to have the badge in one Division much more elaborate than in another.

Dr. Mackenzie's motion was carried.

*Proposed "Journal of Pediatrics."*

Dr. J. A. Macdonald, introducing the report of the Journal Committee, said that about a year ago communications were received from leading pediatricians inquiring whether the Association would undertake the publication of a British Journal of Pediatrics, which would fully represent the work done in this country in this department of medicine. It was stated that the American Medical Association, in addition to its weekly journal, published five periodicals dealing with special branches of medicine, one of them the *American Journal of Diseases of Children*; this publication, according to the last annual report, brought in a profit of 4,558 dollars. After careful consideration of estimates, supplied by the Financial Secretary, the Journal Committee recommended that the Association should start a monthly journal for the publication of what was best in the work of the British school on children's diseases, the material for such a journal to be supplied by a committee of pediatricians (members of the Association), and the Editor of the *British Medical Journal* or his representative to be a member of such committee. It was a new departure for the Association, and it would mean another development on the scientific side of its work.

Dr. Manknell asked what would be the effect upon the *British Medical Journal* if material on this particular subject were diverted to the columns of a specialist journal. Dr. Macdonald replied that that point had been carefully considered. The *British Medical Journal* would have first call on articles on children's diseases, and if an article appeared to have an interest for general practitioners—the constituency which the *Journal* had chiefly to keep in mind—it would appear in that publication; the other would be a specialist journal. It had been suggested that if the venture was successful a proposal to publish other specialist journals might be considered, but the committee was proceeding very tentatively in this matter.

The recommendation that this journal should be started was agreed to.

*A Book on New and Non-official Medicines.*

Dr. C. O. Hawthorne, for the Science Committee, brought forward a proposal that machinery should be set up by the Association to provide full and trustworthy information for the medical profession as to the nature and credentials of the unofficial remedies which in a continuous stream were brought to its notice, and that this information should be collected into a book containing a select list of those unofficial remedies which satisfied certain criteria as to authenticity, *bona fides*, and method of presentation to the profession. He said that for information upon the many different substances which came into the market the profession was largely dependent upon the manufacturer of those substances; by what was now proposed the profession would be informed upon the nature of substances which were really genuine and protected against substances not genuine. In the *Journal* reports were made from time to time by the pharmacologist, but reports appearing

in a periodical publication could not have the same permanent value or accessibility for reference as those embodied in volume form. The class of substances examined would be non-official medicines which had made their appearance within a comparatively recent date; patent and proprietary medicines, though not absolutely excluded, would form only a secondary and subordinate section. The main purpose would be to examine remedies which were pressed upon the profession, not nostrums pressed upon the public. Professor Dixon and Dr. Dale, who as expert pharmacologists necessarily kept a critical eye upon new substances professing to have pharmacological reactions or therapeutical value, had taken the initiative in pressing this proposal. Another reason which weighed with some members of the Science Committee was that a scheme of this order had been conducted by the American Medical Association. An annual volume constructed out of the expert reports would afford the profession trustworthy and up-to-date knowledge of modern therapeutic substances and methods. The work would necessarily entail considerable capital expenditure. There would have to be an expert director, in whom the Association must have full confidence, and for whom it must be prepared to accept responsibility; and in addition there would be laboratory charges. It would be absurd to compile a volume from all sorts of different sources. The examination contemplated was intended to bring under review the physical, chemical, and pharmacological properties of the substances. It was not proposed to embark upon a scheme of therapeutic investigation; the apparatus and machinery for such investigation was not available; and, further, neither the British Medical Association nor any other body ought to attempt to set up in the medical profession a standard of orthodox therapeutics. Advice, suggestion, information by all means, but not the thunder of infallibility.

Dr. Brackenbury proposed, and it was agreed, that the Council approve further consideration of the proposals by the Science Committee, subject to a report by the Finance Committee on the financial aspects of the scheme.

*Payment of Pathologists.*

Dr. Hawthorne brought forward some recommendations on the remuneration of pathologists, with the object of bringing such remuneration into line with the scale of minimum commencing salaries for other public health officers. The pathologist in his third year, accepting a salary of £500 as a full-time permanent appointment, would be paid £500 still in his fourth and fifth year, during which time the clinical worker would be paid, not £500, but £600. The Science Committee had not made—indeed, it was not within its province to make—any attempt to review the whole scale of payments which had been approved by the Council and the Representative Body and which had been in existence for some time, but it had concerned itself with this one particular point in respect to which pathologists were not equitably dealt with.

After some discussion of phraseology, the recommendation was agreed to in the form in which it appears under "Science" in the Supplementary Report of Council in this issue of the SUPPLEMENT.

*The New Premises and other Headquarters Business.*

The provisional arrangements for the opening ceremony at the British Medical Association House on July 13th were discussed in detail, and a certain order of proceedings was approved, together with a list of guests to be invited. The Chairman emphasized the fact that the dominant feature of the gathering would be that of a medical function. It was not possible to accommodate all who desired to attend, and the admission arrangements had already been the subject of most anxious consideration in the committee.

The report of the Finance Committee relating to the new lease of the Tavistock Square premises, the measures to be taken in disposal of the old premises at 429, Strand, and the means of meeting the financial commitments in connexion with this new chapter in the Association's history, were also considered at great length, and the Council formulated expressions of its opinion on certain points for the guidance of the Finance Committee in connexion with future developments. The likelihood of an appreciation in value of the Strand property, should certain proposed architectural developments in the Charing Cross neighbourhood mature, was one of the matters considered.

Reports were also received from the Scottish and Irish Committees. The principal matter in the report of the Scottish Committee was with regard to the new Scottish house of the Association, and the Chairman said that the Council should compliment the Scottish Committee, and in particular Dr. C. E. Douglas and Dr. J. R. Drever (respectively chairman and secretary), on a very successful opening function which would enhance the prestige of the Association in Edinburgh and in all Scotland. ("Hear, hear.")

The Irish Committee brought forward the further consideration of the Irish Medical Secretaryship consequent upon the election of Dr. T. Hennessy to the Dail. Dr. Peacocke stated that Dr. Hennessy had made an arrangement with another medical member, Sir James Craig, whereby he was not required to part in attendance at the Dail until after 6 o'clock each day. The Irish Committee felt that to have Dr. Hennessy in the Dail was a good thing for the British Medical Association.

The report of the Irish Committee was approved, and the Office Committee was instructed to report in the meeting of the Council in March next on the working of the arrangement.

#### *Retired Pay of Majors R.A.M.C.*

Sir Richard Luce, M.P., who brought forward the report of the Naval and Military Committee, mentioned that a new difficulty had arisen in connexion with the retired pay of officers of the R.A.M.C. of twenty years' service, having in view the possible reductions (up to a total of 20 per cent.) which might be enforced. All officers who entered the Corps previous to 1919 did so on the distinct understanding that they would receive retired pay at the rate of £1 a day after twenty years' service. Under the 1919 Royal Warrant the pension was raised to £396 a year, subject to a total potential reduction of 20 per cent., and only those officers who had actually attained the rank of major when the new Warrant was issued were given an assurance that their pensions would in no case be reduced below the pre-war figure. All other officers who entered the Corps before the 1919 Warrant stood to have their pensions reduced ultimately to a figure considerably below what they understood they would receive when they entered the service. Many questions had been asked in the House of Commons, but the effect of the War Office reply had always been to put the matter off, and so far there had been no redress. The whole matter was one of great importance to the senior surgeon to be faced as strongly as the question of the recommendation commanders had already been. He moved the recommendation to the Representative Body which appears under "Naval and Military" in the Supplementary Report of Council, and this was seconded by Dr. Macdonald (who said that he could not imagine anything meaner than the way in which these majors had been treated), and was warmly supported by Dr. Goodbody. The motion was agreed to.

#### *Remuneration of Assistants in General Practice.*

Dr. Dain, Chairman of the Insurance Acts Committee, in bringing forward certain recommendations, said that in view of the duty of the Association to newly qualified members of the profession, who were joining the Association in considerable numbers, the subcommittee of the Organization Committee which was concerned with this matter had had under consideration the payment of assistants in general practice, and had asked the Insurance Acts Committee for its opinion on the subject from the point of view of insurance practitioners. His committee had made certain recommendations, but it was of opinion that steps should not be taken at present for these to become the declared policy of the Association; rather should they be used for educational purposes for a time, and to assist the office in advising on any point in connexion with the terms and conditions of work. The Medico-Political Committee had made certain verbal amendments, which he was ready to accept.

The recommendations as amended were adopted. They are set out in the Supplementary Report of Council under the heading "Medico-Political and Parliamentary."

#### *The New Pensions Bill.*

Dr. Brackenbury drew attention to the new Pensions Bill now before the House of Commons and its reaction upon National Health Insurance. The Association's witnesses before the Royal Commission put forward as one of the most important points in the profession's programme an alteration in the personnel of insured persons—that insured persons should not be defined in the way they were at present. But, most unfortunately, just after that evidence had been given, the Government introduced the Widows', Orphans', and Old Age Contributory Pensions Bill, in which it stereotyped the definition of insured persons to "those persons insured under the Acts." Thus while a Royal Commission was considering whether these were the right persons to include, the Government introduced a bill which insured persons were under people who had in the past been insured persons would this bill brought in for the new pensions, and it was provided that if they were to be in for the new pensions they would have to be in for the health insurance also. That was to bring in again a class of persons who, by the efforts of the profession and as a result of time and experience, had been excluded from the operation of the Insurance Acts. Thus a class of persons who had been proved to be well able to manage for themselves were to come back into the purview of insurance

practitioners because they had at same time or other been for two consecutive years insured persons. That was a matter of which the Council should take cognizance. It went against the evidence which the Association had brought forward, and was quite opposed to the experience of the profession in insurance work.

Dr. Brackenbury was asked to draft a resolution on the subject, and it was also agreed to bring up the matter, if possible, at the deputation to the Minister of Health to take place the following week. The resolution as proposed by Dr. Brackenbury, seconded by Dr. Goodbody, and agreed to by the Council, was in the following form:

The Council is advised that certain provisions of the Widows', Orphans', and Old Age Contributory Pensions Bill not only make it more difficult to alter the definition of insured persons under the National Health Insurance Acts (a point of great interest to the profession and one on which they have given definite evidence before the Royal Commission on National Health Insurance), but bring into health insurance others who have ceased to be insured persons or have been excluded from health insurance under previous Acts. The Council is of opinion that it is essential that the new Pensions Bill should be amended in both these respects.

It was also agreed to draw the attention of medical members of Parliament to the matter if the answer of the Minister was not satisfactory.

#### *Ophthalmic Benefit.*

Dr. Wallace Henry reported that the Ophthalmic Committee had been acting jointly with the Insurance Acts Committee in connexion with the matter of ophthalmic benefit in circumstances fully set out in the Supplementary Report of Council under "National Health Insurance." His committee was of opinion that the work of keeping up a proper standard in the Association's list of ophthalmic surgeons willing to treat insured persons at a reduced fee would be best accomplished by strengthening the present Ophthalmic Committee by the addition of three members—one to be nominated by the Insurance Acts Committee, one by the Association's Section of Ophthalmologists, and the third by the Council of British Ophthalmologists. This was agreed to.

#### *Committee on Drug Addiction.*

On the report of the Medico-Political Committee, Dr. J. W. Bono mentioned that the Departmental Committee on Drug Addiction had had eighteen sittings, and had asked the witnesses might be sent by the Association. It was also requesting information on certain points which were like to be of vital importance to the profession. He thought that the Council would desire to appoint a small committee to consider and criticize a memorandum which had been drawn up on this subject, and which was to be submitted to the Association's witnesses before they met the Departmental Committee. The witnesses would then be able to speak with the authority of the Association.

It was agreed to set up such a committee, and that it should consist of Dr. Hillman, Dr. Brackenbury, Dr. J. A. Macdonald, Dr. Bone, and the Chairman of Council, in addition to the four who had been nominated by the Medico-Political Committee to give evidence—Dr. E. K. Le Fleming, Dr. C. P. Symonds, Mr. E. B. Turner, and the Medical Secretary.

#### *Hospitals Committee.*

A report of the Hospitals Committee was brought forward by Mr. Souttar, and after a brief discussion on the payment of medical staffs of hospitals in respect of accident cases the recommendation was adopted, which is set out in the Supplementary Report of Council under that heading.

The Council, which began its session at 10 a.m., did not rise until 9 p.m.

#### LEGAL POSITION WITH REGARD TO THE STERILIZATION OF THE UNFIT.

The case submitted to Council and the opinion expressed by him are printed below. Sir Travers Humphreys's opinion must not be taken necessarily as representing the view of the Council of the British Medical Association (see page 283 of SUPPLEMENT).

#### *Case for the Opinion of Council.*

The circumstances under which the advice and assistance of Council are sought are as follows:—Public and professional interest have in the course of recent years centred closely upon the subject of those who are mentally defective and various problems affecting the welfare of the community have from time to time emerged and formed the subject of discussion. It has in fact become one of the burning questions of the day.

It follows that arising out of the general interest thus created many medical men are, in the course of their practice, consulted by parents or guardians of children falling within the categories referred to in this Case as to whether the operation of sterilization

can with safety be performed and if so whether they will undertake it.

The position thus created has seriously exercised the minds of a large section of the Medical Profession particularly in so far as the legal aspects of it are concerned and it is in view of obtaining enlightenment on this head that this Case is submitted on behalf of the British Medical Association for Counsel's opinion.

The operation would be simple in character as applied to either sex and would not involve any appreciable risk to life if skilfully performed.

Upon the male it would consist of the administration of a general anæsthetic—skin incisions in the inguinal regions to expose tubes—Excision of a portion of each tube between the two ligatures—Closure of skin incisions by sutures.

Upon the female it would consist of the administration of a general anæsthetic—Abdominal incisions involving opening of the peritoneal cavity—Removal of a portion of the Fallopian tubes between the two ligatures—Closure of the abdominal incision by sutures.

The operation would be performed entirely on "eugenic" grounds—that is to say for the purpose of preventing the procreation of degenerate or mentally abnormal offspring.

In this connection it is presupposed that it cannot be said with absolute certainty that the offspring of the person to be operated upon will come within this category but that it is in the highest degree probable that this would be so and that further it is in the highest degree probable that such offspring would transmit the taint to future generations.

The cases in which medical men are asked to operate fall into two separate classes, viz:—

(1) Persons suffering from one of the four varieties of mental defect defined by the Mental Deficiency Act, 1913—i.e., Idiots, Imbeciles, Feeble-minded and Moral Imbeciles.

(2) Persons suffering from Epilepsy who though mentally abnormal are nevertheless not mentally defective within the legal definition of that term as set out in (1) above.

The circumstance under which the medical man is usually consulted is when the child is in infancy but there are occasions which have occurred after the child has attained his or her majority.

It is to be presupposed that the consultation is sought and the request to perform the operation is made by or with the assent of both parents of the child thus afflicted, or if one parent only is living then by that one parent, or alternatively by the guardian of the child if no parents are living. Cases have however arisen in which there has been division of opinion on the subject between the parents, the father desiring the operation to be performed and requesting the medical man to perform it whilst the mother has been entirely opposed to it and vice versa.

I am given to understand that in the case of a mentally defective child or adult it is within the competence of an experienced medical man to say with confidence that the mind of the person thus afflicted will never be normal.

The main point which arises is whether what is suggested can be done with legal justification and protection in the case of a child and/or an adult who is suffering from mental defect as defined by the 1913 Act and/or who is suffering from Epilepsy.

If it can, then the position is clear and free from difficulty.

If it cannot then the following subsidiary questions arise, namely:—

What is the nature and measure of legal risk which is involved, to whom does it attach, and at whose instance or suit would it lie to put the Law in motion.

If there is in fact real or appreciable legal risk to (a) the parents (b) the guardian or (c) the medical man who operates, is such risk capable of being mitigated or wholly nullified by either an indemnity being taken or an agreement being entered into. If so, what should be the nature of the indemnity and by whom and to whom should it be given in order to render it effective. Alternatively, what should be the burden of the indemnity and who should be made parties to it in order to enforceable.

half of the British Medical Association to advise on the questions raised by and set out in the foregoing Case.

#### Opinion of Counsel.

1. The main question raised in this Case is undoubtedly one of the greatest importance to the community at large and the medical profession in particular, but from the legal point of view the matter is free from doubt and the question admits of only one answer. I am clearly of opinion that any medical man who performs the operation described upon a "defective" within the meaning of that term as defined in the Mental Deficiency Act, 1913, would, in the present state of law, be acting illegally and without any legal justification. I assume the consent of both parents and the excellence of the motives of all concerned, but the fact remains that the operation of sterilization involves an

assault upon and the wounding of the person operated upon. The only legal justification for such action in regard to a person who either from extreme youth or old age or from any other cause such as mental weakness is incapable of giving a reasoned consent would be that the operation was necessary to the health or well-being of the patient. I do not gather from the Case that it is contended that sterilization would improve the condition, physical or mental, of the defective.

2. The legal risks involved in such an operation would attach equally to all the persons concerned—that is, the doctor who performed it and the parent or guardian who requested or sanctioned it. The case of the mother where both parents are consenting parties might differ, but on grounds which are of no interest in the present Case. Those risks may be divided into two categories, (a) criminal and (b) civil.

As to (a) The doctor would have, in my opinion, no answer to an indictment for the offence of unlawful wounding contrary to Section 20 of the Offences Against the Person Act, 1861. Proceedings might equally be taken against the parent or guardian under Section 55 of the Mental Deficiency Act, 1913, which provides *inter alia* that any person having charge of a defective who ill-treats the defective shall be guilty of a misdemeanour and the doctor might be charged with aiding and abetting. In the case of an infant the parties would also bring themselves within the provisions of Section 12 of the Children Act, 1908, the parent or guardian being liable to be charged that, having the care of a child, he wilfully caused the child to be assaulted in a manner likely to cause such child unnecessary suffering including injury to or loss of any organ of the body, and the doctor for aiding and abetting. In none of these offences does the excellence of the motive of the accused afford any defence.

As to (b) An action for damages could be brought by the defective by his or her next friend in the same manner as actions are now brought by infants. In such an action damages might be recovered against the doctor as well as the parent or guardian. The Statutes of Limitation would apply to such an action and in the case of an action for assault the limitation is four years; but it is to be noted that the Statutory Limitation does not run while the Plaintiff is under the age of 21 or non compos mentis.

Truly a jury might be disposed to take the view that in the public interest the conduct of the Defendants was excusable and even praiseworthy and mitigate the damages accordingly, but it must not be forgotten that the operation would have deprived the defective of the exercise of a function which the law nowhere denies to him or her. On the contrary the elaborate provisions of the Mental Deficiency Act for the safeguarding of such persons might be invoked as indicating that the only means sanctioned by the law of obtaining the desired end, viz., preventing the propagation of the unfit, consists in the segregation of such persons in licensed institutions.

3. It is settled law that an indemnity for liabilities incurred in carrying out an illegal contract, or purposes is void—see *Leake on Contracts*. In my opinion, therefore, no action could be successfully brought on such a contract for indemnity the consideration therefor being illegal.

4. With regard to epileptics the above observations, of course, apply in the case of children of tender age. In the case of an epileptic of mature years the matter would depend upon whether the person was able to and did give his or her consent to the operation. I am not told in the Case but I assume that a person subject to epileptic fits may be quite normal and of full reasoning power between his attacks. In such a case the consent of the patient would afford an answer to any proceedings, criminal or civil, but I should advise that great care be taken in obtaining the clearest evidence of such consent before the operation is performed. In the absence of such consent the performance of the operation would be clearly illegal.

TRAVERS HUMPHREYS.

1, TEMPLE GARDENS,  
TEMPLE.  
16th March, 1925.

#### TABLE OF DATES.

July 3, Fri.	Amendments and riders for issue in A.R.M. Agenda must be received by this date.
July 13, Mon.	Opening of the New House of the British Medical Association by His Majesty King George accompanied by Her Majesty Queen Mary.
July 17, Fri.	Annual Representative Meeting opens at Bath. Nominations for election of 12 members of Council by grouped Representatives must be received (at A.B.M., Bath) by this date.
July 18, Sat.	Annual Representative Meeting, Bath.
July 20, Mon.	Council, and Annual Representative Meeting, Bath.
July 21, Tues.	Annual Representative Meeting. Annual General Meeting, Bath. President's Address.
July 22, Wed.	Council, Meetings of Sections, Conference of Honorary Secretaries, Bath.
July 23, Thurs.	Meetings of Sections, etc., Bath.
July 24, Fri.	Meetings of Sections, etc., Bath.

ALFRED COX, Medical Secretary.

## British Medical Association.

## CURRENT NOTES.

## Royal Opening of the New House.

FOLLOWING up the note on this matter which appeared in last week's SUPPLEMENT, we desire to impress upon those members who wish to ballot for seats at the ceremony, on Monday, July 13th, the importance of making early application. As it is impossible to communicate with all the relatives of all the members who fell in the great war, it is hoped that members will bring to the notice of such relatives as they know, the fact that on application to the Secretaries of the Reception Committee, British Medical Association House, Tavistock Square, W.C.1, they will be given a seat to witness the ceremony of dedication and opening of the Gates and a ticket for the evening entertainment. As the road into the New House will have to be closed to the public some time before the ceremony begins, all those who receive tickets of admission must be in their places not later than 2.30 p.m. As has already been announced, uniform or academic costume with decorations is to be worn in the afternoon, and uniform or evening dress with decorations in the evening. Messrs. Ede and Ravenscroft, 93, Chancery Lane, London, W.C.2, the official providers of academic costume for the Association, will be in attendance at the building, and rooms for robing will be provided. Those who wish to have robes ready for them must communicate with Messrs. Ede and Ravenscroft direct.

## The Library of the Association.

The Library of the British Medical Association at 429, Strand, was closed on June 23rd, and will not be reopened at Tavistock Square until Wednesday, July 15th. During that period the Reading Room also will be closed and the work of the Lending Library will be suspended. It has been found necessary to take these steps in order to give the Library staff an opportunity of removing and rearranging the contents of the Library without interruption. Members of the Association who are in the habit of inspecting the Notice Boards in the lobby of the house or in the Library, for information as to surgical operations, lectures, etc., are advised to consult in the meanwhile the Fellowship of Medicine at the Royal Society of Medicine, 1, Wimpole Street, W.1.

The offices of the *British Medical Journal* and of the Medical and Finance Departments have been removed to the Association's new headquarters in Bloomsbury. Address: British Medical Association House, Tavistock Square, W.C.1. The telephone numbers and telegraphic addresses will be found on the last page of the Supplement, preceding the Diary of the Association.

## Anglo-French Exchange Visits.

The British Medical Association has received a copy of a letter from a French medical man of standing in the Riviera who wishes to spend a fortnight in London at the end of September, if possible in the family of an English practitioner or medical student. In return for this hospitality he would, on his return home, be pleased to receive his host on the same conditions—that is to say, he would lodge and board him, and make his stay as pleasant as possible. Inquiries should be addressed to Mr. B. S. Townroe, General Secretary, United Associations of Great Britain and France, 41, Arcade House, 27, Old Bond Street, W.1.

## The Half-yearly Indexes.

The usual half-yearly indexes to the JOURNAL and to the SUPPLEMENT and ERRATA have been prepared and will be published shortly; they will, however, not be issued with all copies of the JOURNAL, but only to those readers who ask for them. Any member or subscriber who desires to have one or all of the indexes can obtain what he wants, post free, by sending a post-card notifying his desire to the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1. Those wishing to receive the indexes regularly as published should intimate this desire.

## Association Notices.

## NOTICE OF ANNUAL GENERAL MEETING.

NOTICE IS HEREBY GIVEN that the Annual General Meeting of the Association will be held in the Concert Hall, Grand Pump Room, Bath, on Tuesday, July 21st, 1925, at 2 p.m. Business: (1) Minutes of last Meeting; (2) Appointment of Auditors; (3) Report of Election of President for 1925-26.

ALFRED COX,

Medical Secretary.

L. FERRIS-SCOTT,

Financial Secretary and  
Business Manager.

## NOTICE OF EXTRAORDINARY GENERAL MEETINGS.

NOTICE IS HEREBY GIVEN by Order of the Council that an Extraordinary General Meeting of the British Medical Association will be held in the Concert Hall, Grand Pump Room, Bath, in the County of Somerset, on Friday, the 17th day of July, 1925, at 4.45 o'clock in the afternoon, when the following Resolution will be proposed as an Extraordinary Resolution, namely:

That the Articles of Association of the British Medical Association be altered in manner following—namely:

(a) By inserting immediately after Article 35 the following new Article—namely:

## "Affiliation.

"(1) The Association may admit to affiliation with it any Medical Association or similar body established outside the United Kingdom on such terms and with such privileges as may in each case be approved by resolution of the Representative Body passed after consideration of a report by the Council.

"(2) The Association may terminate any such affiliation (after due notice on either side) by resolution of the Representative Body passed after consideration of a like report.

"(3) Any resolution of the Representative Body under this article shall be final and shall not require to be approved under Article 34."

(b) By inserting in Article 34 immediately after the word "Body" in line 7 the words:

"except as otherwise expressed in the Regulations."

Should the above Resolution be passed by the requisite majority it will be submitted for confirmation as a Special Resolution to a further Extraordinary General Meeting, and such meeting will be held at the British Medical Association House, Tavistock Square, London, W.C.1, on Tuesday the 4th day of August, 1925, at 2.30 o'clock in the afternoon for the purpose of considering and, if thought fit, confirming such Resolution as a Special Resolution accordingly.

Dated this 22nd day of June, 1925.

By Order of the Council.

ALFRED COX,

Medical Secretary.

L. FERRIS-SCOTT,

Financial Secretary and  
Business Manager.

British Medical Association House,  
Tavistock Square, London, W.C.1.

## NOTICES OF MOTION BY DIVISIONS FOR THE ANNUAL REPRESENTATIVE MEETING, BATH, 1925.

## Nursing Homes (Registration) Bill.

By SOUTHPORT: That (with reference to para. 118 of Annual Report of Council) this meeting learns with dismay of the proposals to register and inspect, etc., private nursing homes, and instructs the Council to oppose the bill with all its power.

## Factory Medical Service.

By MANCHESTER: That the "principles" set out in para. 127 of the Annual Report of Council, under the heading "Factory Medical Service," be referred back to the Council for further consideration.

**Coroners' Law and Death Certification.**

By SUNDERLAND: That (with reference to the Recommendation contained in para. 101 of the Annual Report of Council) £2 2s. be substituted for £1 11s. 6d. in para. 41 B (3) of Appendix III.

**Scale of Salaries for Public Health Appointments.**

By SUNDERLAND: That (with reference to the Recommendation contained in para. 164 of the Annual Report of Council) the section of the scale of minimum commencing salaries dealing with "medical officers employed in departments" (see Appendix IV to Annual Report of Council) be amended in the following respects:

(a) By the deletion of "£500" and the substitution thereof of "£500";

(b) By the insertion, in the second column, of the words "rising by annual increments of £25 to £550 on merit being shown by the medical officer"; and

(c) By the deletion of the last two sentences of the definition.

**Insurance Practitioner's Right of Appeal to Courts against Decisions of the Minister of Health.**

By CHICHESTER and WORTHING, and HORSHAM: That it be an instruction to the Council that when consulting the Divisions as regards any suggested amendments of or additions to the Policy of the Association in reference to the National Health Insurance Acts, or extensions of the same, they include for consideration the following proposal—namely:

That, in addition to the right now enjoyed of appeal to the Courts on the ground of improper procedure, appeal to the High Court shall be legitimate against any penalty, other than removal from the panel, imposed upon a practitioner by the Minister.

**BRANCH AND DIVISION MEETINGS TO BE HELD.**

**ABERDEEN BRANCH.**—The summer meeting of the Aberdeen Branch will be held in the Stotfield Hotel, Lossiemouth, at 12 noon to-day (Saturday, June 27th). The meeting will be a joint one with the nch. Train leaves Aberdeen at 8.5 a.m. at 7.35 p.m. Lunch in the Stotfield Hotel, Dinner in the Station Hotel, Elgin, at 6.30 p.m.

**BIRMINGHAM BRANCH: DUDLEY DIVISION.**—The Chairman, Dr. T. M. Tibbets, is giving a garden party on Thursday, July 2nd, at 3 p.m., to the members of the Dudley and Bromsgrove Divisions, at his house, "Redlands," Stourbridge. During the afternoon a meeting will be held to instruct the Representative, after which the time will be given up to tennis, clock golf, croquet, bowls, etc.

**BORDER COUNTIES BRANCH.**—The fifty-fourth annual general meeting of the Border Counties Branch will be held in the Cumberland Infirmary, Carlisle, on Friday, July 10th, at 3.45 p.m. Agenda: Branch Council report and financial statement; election of officers for 1925-26; Mr. Norman McLaren, T.D., F.R.C.S. Eng., will deliver his presidential address entitled "The Cumberland Infirmary, past, present, and future." The Branch Council will meet at 3.15 p.m. Tea.

**BORDER COUNTIES BRANCH: DUMFRIES AND GALLOWAY DIVISION.**—A social meeting has been arranged in the form of a motor trip to Dalry, Galloway, early in July.

**EAST YORK AND NORTH LINCOLN BRANCH.**—The sixty-ninth annual meeting of the East York and North Lincoln Branch will be held at the Grimsby and District Hospital on Friday, July 10th, at 3 p.m., when the President-Elect, Dr. W. Wallace, will be installed as President for the coming year. Business: Annual report and financial statement; election of officers. The President will deliver the inaugural address.

**EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.**—An ordinary meeting of the South-Eastern Counties Division will be held in the Railway Hotel, Newtown St. Boswells, on Wednesday, July 1st, at 3 p.m. Business: Instructions to Representative in Representative Body; invitation to opening of the British Medical Association House; address by Dr. Ernest Muir, research worker at the School of Tropical Medicine and Hygiene, Calcutta, on the changed aspect of the leprosy problem.

**LANCASHIRE AND CHESHIRE BRANCH: ROCHDALE DIVISION.**—A meeting of the Rochdale Division will be held in the Wellington Hotel, Rochdale, on Wednesday, July 1st, at 8.30 p.m. Business: To instruct the Representative for the Annual Representative Meeting. Members are requested to take with them to the meeting the SUPPLEMENTS for April 11th and 18th, May 16th, and June 27th.

**METROPOLITAN COUNTIES BRANCH: ST. PAUCRAS DIVISION.**—The inaugural meeting of the St. Paucras Division will be held at the Midland Hotel, St. Paucras, on Tuesday, July 7th, at 8.45 p.m. Agenda: To approve the election of officers, representatives, and executive committee; adopt organization rules. Address by Mr. Bishop Harman, F.R.C.S., on some common eye conditions.

**NORFOLK BRANCH.**—The annual meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital on Wednesday, July 8th, at 3.15 p.m. Agenda: Annual report of Branch Council and financial statement; induction of new President, Mr. Cecil Jeffery Muriel; election of President-Elect and two Vice-Presidents; address by His Honour Judge Herbert-Smith, LL.D., County Court

Judge for Norfolk, on the law and procedure under the Workmen's Compensation Act. At 4.30 p.m. tea in the hospital grounds by invitation of Mr. and Miss Muriel.

**NORTH OF ENGLAND BRANCH.**—The annual meeting of the North of England Branch will be held at 7, Windsor Terrace, Newcastle-upon-Tyne, on Thursday, July 2nd, at 12.30 p.m. This will be followed by a luncheon, and the annual golf competition will be held at Gosforth Park on that afternoon. Agenda: Election of officers. The following have been nominated by the Branch Council: President, Dr. J. Hudson. Vice-Presidents, Dr. F. Beaton (Ashington) and Dr. T. J. Kirk (Norton-on-Tees). Honorary Secretary and Treasurer, Mr. Norman Hodgson. Honorary Scientific Secretary, Dr. Harvey Evers. Any other competent business.

**NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH.**—The annual meeting of the North Lancashire and South Westmorland Branch will be held at Galgarrath Hospital, Windermere, on Tuesday, June 30th, at 3.15 p.m. Dr. John Hay (Liverpool) will give an address entitled "The significance of raised blood pressure." Members are requested to keep this date free. Ladies are invited.

**NORTH WALES BRANCH.**—The annual meeting of the North Wales Branch will be held at Carnarvon on Friday, July 10th. The President will deliver an address. Members wishing to read papers, show cases or specimens, are asked to communicate with Dr. E. Lewis-Lloyd, Branch Secretary (Rhianfa, Towyn, Merioneth), not later than July 1st.

**NORTHERN COUNTIES OF SCOTLAND BRANCH.**—The annual meeting of the Northern Counties of Scotland Branch will be held at the Stotfield Hotel, Lossiemouth, to-day (Saturday, June 27th), at 12 noon. After the business meeting the members of the Branch will lunch with the members of the Aberdeen Branch, who are holding their annual meeting at the same place and at the same time. Thereafter arrangements have been made for golf on the Lossiemouth golf course and for an excursion to various places of historical interest in the vicinity to be taken part in by both Branches.

**OXFORD AND READING BRANCH.**—The annual meeting of the Oxford and Reading Branch will be held at the Radcliffe Infirmary, Oxford, on Friday, July 10th, at 3 p.m. Agenda: Election of officers; paper by Mr. J. E. H. Roberts, O.B.E., F.R.C.S.: Modern chest surgery. In the morning the Collier golf cup will be played for at Frilford Heath against bogey. Competitors take three-quarters of their lowest handicap. Transport from Oxford Station can be arranged on application to the honorary secretary, Dr. William Stobie.

**SOUTH WALES AND MONMOUTHSHIRE BRANCH: SOUTH-WEST WALES DIVISION.**—The annual meeting of the South-West Wales Division will be held at the Ivy Bush Hotel, Carmarthen, on Tuesday, June 30th, at 3 p.m. Business: Appointment officers for the coming year; instruct the Representative to the Annual Conference.

**SUFFOLK BRANCH: WEST SUFFOLK DIVISION.**—A combined clinical and social meeting of the West Suffolk Division will take place on Thursday, August 6th, when Dr. Wood has very kindly offered to entertain the Division once more at Woolpit. Tea in his garden will follow a clinical meeting at the Institute.

**SUSSEX BRANCH.**—The annual meeting of the Sussex Branch will be held in the Blatchington Court Hotel, Seaford, to-day (Friday, June 26th), at 2.15 p.m. Agenda: Correspondence; election of officers; induction of President, who will give an address on some emergencies in general practice; annual report and financial statement; organization rules. The President-Elect (Dr. W. P. Morgan) invites members to luncheon at 1 p.m. After the meeting members will visit the Seaside Branch of the Chailey Hermitage, and then proceed to the Hermitage at Chailey, where the use of heliotherapy and actinotherapy will be demonstrated. Mrs. Kimmins invites the members to tea at the Hermitage. The Seaford Golf Club will welcome members who wish to make use of the links.

**Meetings of Branches and Divisions.**

**METROPOLITAN COUNTIES BRANCH: LEWISHAM DIVISION.** A meeting of the Lewisham Division was held on June 16th, when Dr. R. GORVIN CHASE was in the chair. Sir Percy Bassett-Smith was appointed delegate to the Conference of the National Association for the Prevention of Tuberculosis.

Dr. E. OFENHEIM delivered an address on the importance of the cinematograph in teaching. Films were shown, and described by the lecturer beforehand, dealing with relapsing fever, trypanosomiasis, Leishmaniasis, filariasis, and organisms in the intestine of mice. A coloured film showed water animalcules and an x-ray demonstration of peristaltic movement of the stomach, and the concluding film showed the action of the reptilian heart demonstrated for physiological teaching.

Sir PERCY BASSETT-SMITH mentioned that relapsing fever in India was different from that of Africa, and that eosinophilia was present with *Filaria loa*. Dr. HALLINAN spoke of filaria treatment in Fiji. A vote of thanks was accorded to the lecturer on the motion of Dr. CHASE, seconded by Dr. WHITE.

**METROPOLITAN COUNTIES BRANCH: WILLESDEAN DIVISION.** The annual meeting of the Willesden Division was held at the Willesden General Hospital, Harlesden Lane, on May 27th, when Dr. W. W. STOCKER was in the chair. The financial statement for 1924, showing a balance in hand at December 31st, 1924, was approved.

The CHAIRMAN, in reporting as to the work of the Division during the preceding twelve months, stated that while the Division need not be ashamed of the amount of work it had got through, the

meetings had not been so well attended as they might have been. The Chairman's report was approved. The question of action being taken to stimulate the interest of members in the meetings of the Division was referred to the Executive Committee.

On the motion of the CHAIRMAN, it was resolved to tender the thanks of the Division to the board of management of the Willesden General Hospital for permitting the Division the use of a room for its meetings, and especially to the matron for looking after the comfort of the members attending.

Dr. SCOTT, in proposing a vote of thanks to the retiring Chairman, stated that Dr. Stocker had during his period of office never spared himself any trouble for the benefit of the medical profession of Willesden. The vote of thanks was carried, and Dr. Stocker expressed his appreciation thereof.

Dr. SKENE spoke as to the necessity for the Division expressing its thanks to Dr. Paterson, their honorary secretary, to whose efforts had been due the resuscitation of the Division, and who apparently, judging by the time spent, thought more of the welfare of the profession, both locally and generally, than of his own. At Dr. Skene's suggestion the Division placed on record its hearty thanks to Dr. Paterson for his work, and its high appreciation of him as a secretary, as a colleague, and as a man.

A vote of thanks was, on the motion of the CHAIRMAN, accorded to Mr. S. Coulson for his assistance during the year.

The following officers were elected for the ensuing year:

Chairman, Lieut.-Colonel H. Kirkpatrick, I.M.S. (ret.), *Vice-Chairman*, Dr. W. Lock, *Honorary Secretary*, Dr. W. Paterson (reappointed), *Clinical Secretary*, Dr. J. W. Brash (reappointed).

#### SOUTH WALES AND MONMOUTHSHIRE BRANCH.

The annual general meeting of the South Wales and Monmouthshire Branch was held at the Royal Gwent Hospital, Newport, Mon., on June 17th.

After the usual business had been transacted, Dr. O. A. BRISTOCKE (Haverfordwest), the retiring President, vacated the chair, and installed Dr. R. J. COULTER (Newport) as President for the year. A hearty vote of thanks was accorded Dr. Bristocke for the able way in which he had performed the duties of his office.

Dr. R. J. COULTER delivered his presidential address on preventable blindness, dealing first with blindness from an economical standpoint, and with the education of those afflicted. The earning value of a blind person was only one-half or one-third that of a normal worker. Curable diseases such as cataract and preventable disease such as glaucoma were mentioned, and considered from an industrial and non-industrial standpoint. Interstitial keratitis and ophthalmia neonatorum were discussed in detail with statistics, and the great value of prophylactic treatment emphasized. Finally Dr. Coulter dealt with eye injuries as met with in mines, factories, and workshops, and the various means available for their prevention.

The address was of great interest to both specialists and practitioners, and a hearty vote of thanks was accorded Dr. Coulter.

#### SUSSEX BRANCH: CHICHESTER AND WORTHING AND HORSHAM DIVISIONS.

A COMBINED meeting of the Chichester and Worthing and Horsham Divisions was held at the Norfolk Hotel, Arundel, on June 16th, when Dr. KINNEAR (Horsham) was in the chair.

The meeting considered the Annual Report of the Council. The Representative was instructed to oppose the recommendation of the Council on the questions of individual representation, of the composition of the General Medical Council, and of opinion as regards the latter question.

A motion, which appears at page 289, was adopted for inclusion in the Agenda of the Annual Representative Meeting at Bath.

#### WILTSHIRE BRANCH: TROWBRIDGE DIVISION.

A SPECIAL general meeting of the Trowbridge Division was held at Trowbridge Town Hall on June 13th. Dr. H. C. TAYLER, chairman of the Division, who presided, was appointed as the representative of the Division to attend the opening of the new House of the British Medical Association on July 13th. The arrangements for the entertainment of visitors from the Annual Meeting at Bath to Bradford-on-Avon were considered, and a subcommittee was appointed to make local arrangements, with Dr. H. C. Tayler as chairman, Dr. Burnett as secretary, and Dr. Spence as treasurer.

#### WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.

The annual meeting of the Worcestershire and Herefordshire Branch was held at Worcester on June 18th. It was preceded by luncheon at the Crown Hotel.

Dr. Neville Crowe (Worcester) was elected President (1925-26), and Mr. Ainslie (Hereford) President-Elect. Mr. W. B. Butler (Hereford) was re-elected Honorary Secretary and Treasurer. The annual financial statement, showing a balance of £11 16s. 5d., was received.

Dr. Dryland introduced his successor, Dr. Crowe, who took the chair. At a clinical meeting, subsequently held, cases and exhibits were shown by Mr. DUGGAN, Dr. DEVERALL, Mr. CAVENAGH, Mr. BUTLER, Dr. NEVILLE CROWE, and Dr. POWER.

After the meeting it was decided to hold a clinical meeting at Hereford in the latter part of September, and the members then adjourned to tea at the Crown Hotel.

## National Insurance.

### THE LIBERTIES OF THE PROFESSION.

#### MEETING OF INSURANCE ACTS COMMITTEE WITH THE MINISTER OF HEALTH.

THE Minister of Health (the Right Hon. Neville Chamberlain, M.P.) received on May 18th in deputation at the Ministry the members of the Insurance Acts Committee of the British Medical Association. The object of the meeting was to discuss the judicial or semi-judicial functions of the Ministry with special reference to recent cases in which penalties widely felt in the profession to be unjust have been imposed on insurance practitioners.

Dr. H. G. DAIN (Chairman of the Committee) acted as chief spokesman, and was supported by Dr. H. B. Brackenbury, Dr. R. A. Holam, Mr. Bishop Harman, and a very full attendance of the Committee.

The Minister was accompanied by Sir Arthur Robinson (Secretary), Sir George Newman (Chief Medical Officer), Mr. L. G. Brock (Assistant Secretary), Dr. J. Smith Whitaker (Senior Medical Officer), Mr. E. J. Maude (Assistant Solicitor), and Mr. Douglas Veale (Private Secretary).

Dr. DAIN said: We should like, Sir, to express our pleasure on meeting you on this first occasion at the Ministry of Health—a pleasure which is added to in my own case because I come from the same city as yourself. We have ventured to trespass upon your time because we feel rather strongly on the matter which we desire to lay before you. We are concerned at the moment with the nature and effect of a number of recent decisions in disciplinary cases arising out of the National Health Insurance Acts. These are cases in which complaints have been laid against doctors and have been dealt with by the machinery set up under the Acts, eventually coming to your department for decision and judgement. On a recent occasion, when we gave evidence before the Royal Commission now sitting, we brought forward this same subject and made a certain number of points which seemed to us of importance, some of them indeed presenting, in view of the recent decisions, such an aspect of urgency that we felt that we did not wish to wait until the Royal Commission reported, but should ask for an opportunity of talking them over with you.

Our object here, as I hope you will appreciate, is the improvement of the service—the efficiency of the medical service under the insurance scheme. We, as representing insurance practitioners, have as our prime object the efficiency of the medical service and the welfare of insured persons. It is necessary in setting up a scheme of this sort that certain judicial procedure should be agreed upon whereby complaints can be dealt with. Such machinery has been in action for twelve years, and we have conferred with your officers at various times as to alterations and improvements in that machinery. We have always held that it was better that these things should be dealt with by the machinery specially set up than that they should go to any large extent into the courts of the country. This has meant, however, that we have always had a minority, sometimes vociferous, which has maintained that greater justice would be done and greater safety would be felt if recourse were had to the courts. That is not the opinion of my Committee at present, but such a feeling is unquestionably growing among insurance practitioners.

In our evidence before the Royal Commission we drew attention to a number of the points which we wished to emphasize, in particular four points which I want to put before you, and to illustrate them by cases that have actually occurred. The first is:

That when a complaint has been dealt with by the bodies set up by the regulations for this purpose there should not be a liability to have the whole matter reopened by separate departmental action, either by the Ministry itself or by those bodies at the instigation of the Ministry.

There is a case which has become notorious in this connexion. It is a case in which certain doctors in Lancashire were accused of having taken money for drugs. This case came to the Ministry on the recommendation of the Insurance Committee that they should be dealt with by way of fine. But the Ministry, instead of acting on that recommendation, sent for the chairman and clerk of the Insurance Committee, had an interview with them, and directed them to take action under another section of the regulations with a view to recommending removal from the panel. The legality of that was tested in the courts, and the Court of Appeal held that the department was perfectly justified in taking that action. But

what we feel is that when the department is going to be the final judge, and there is no appeal from its verdict, it should not turn round to the Insurance Committee which has made a decision and say, "Don't you think you ought to make another decision before you send it to us to judge upon?" Although the procedure has been upheld in the law courts we think it is very undesirable, and it has caused heart-burning amongst our men. If the decision is to be left in the hands of the Minister, and, as at present, there is to be no appeal from him except on procedure, it is quite wrong that he or his officers should direct the people to come to another decision—not to hear the case again, but to come to another decision—The Insurance Committee in this case was directed to consider that particular report, and to see whether it could not arrive at some other conclusion.

Mr. CHAMBERLAIN: May I, for the purpose of elucidating this statement, ask a question? This was something which occurred before I came here. Was not the effect of the direction of which you speak by the Ministry of Health to the Insurance Committee in this case that it should make what is technically known as a representation for the removal of the offending party from the medical list; and does not the procedure laid down in the regulations involve the setting up of an inquiry if such a representation should be made? Is it not necessary to set up an inquiry when a representation is received?

Dr. DAIN: Yes, when a representation has been made; but the Insurance Committee did not make a representation that the practitioner should be removed from the panel; it recommended that he should be fined.

Mr. CHAMBERLAIN: Yes; but as I understood you in your account of the case, that was the original proposal of the Insurance Committee, that a substantial fine should be inflicted. The Ministry felt that the case was so serious that it was desirable to investigate it further, and they then instructed the Insurance Committee to make a representation to them that the offending party should be struck off the medical list.

Dr. DAIN: Yes; that is what we are objecting to. Mr. CHAMBERLAIN: Would not the effect of that be that there would be necessarily an inquiry committee into the same case? Dr. DAIN: That would be the effect of it, yes, but before that happens the Insurance Committee must have altered its opinion.

Mr. CHAMBERLAIN: That may be so. But you see what I am trying to elucidate? It does not mean that the Ministry thereupon would come to a decision without further inquiry. I think you said that the Insurance Committee was asked to make a second inquiry. But it did mean that a second inquiry had to be made, and of a much more formal character than the first.

Dr. DAIN: But it was in our view a clear invitation to the Insurance Committee to alter its opinion.

Mr. CHAMBERLAIN: But that would be a way of getting it to make a fresh inquiry into the case.

Dr. DAIN: We think that is an objectionable procedure.

Mr. CHAMBERLAIN: Well, we will discuss it later; but I wanted to be sure that we agreed about the facts.

Dr. DAIN: That case is an example of the particular point we wished to make. Our second point is—

That when a complaint has been made in one prescribed form penalties should not be inflicted in respect of offences not formally alleged or of offences which, if alleged, should have been formulated in a different prescribed way and might have required a different line of defence.

A complaint was laid against a doctor before a court of inquiry recently that he had been guilty of gross negligence in his treatment of a case of appendicitis. When the court of inquiry found that no such gross negligence had been proved against him he was then fined for what the report merely described as an error of judgement. In an ordinary court of law one offence is alleged, although frequently alternative suggestions are made as to the nature of the offence that may be proved, and then the accused person in his own defence has an opportunity of defending himself against any possible developments which may occur in the course of the case. We feel that by the methods which have been adopted a man does not get always a fair chance of being defended at the court of inquiry against a matter which may arise and of which there may not be necessarily any special allegation made at the time; nevertheless, on this count he may be subsequently punished, and, of course, after your decision he has no appeal.

Then we want to make specially strongly our third point—

That full consideration should be paid to the findings or recommendations of a committee (whether Medical Service Subcommittee or Inquiry Committee) which has itself investigated the details of the case in mitigation of the heinousness of the misconduct even when proved.

In that connexion I should like to quote a case which happened in Sussex. A doctor, one of the most respected men in the place, was accused of giving certificates wrongly. What was proved against him was that on one occasion when on holiday he issued, in a nervous and chronic case in which a monthly certificate was required, one certificate without seeing the patient. When the true facts were elicited, the complaints wished to withdraw the charge, the Medical Service Subcommittee recommended that no action be taken, the Insurance Committee endorsed that view, and yet in spite of that the Ministry still felt it necessary to inflict a fine of £5 on the practitioner. We do not consider that in that case proper regard was paid to the opinions of the committee set up under the machinery of the Act to carry out this judicial investigation. Another illustration is the case of appendicitis to which I have already referred; here the report of the inquiry committee stated that at the most the man had committed an error of judgement, and the Ministry in dealing with it fined the man on this particular error of judgement because they formed a different opinion from the opinion of the committee. They were not prepared, as we are here, to accept the opinion of the court of inquiry. But the court of inquiry is in a position to see the witnesses and hear the evidence, whereas the department can merely read the evidence which the court has heard.

On our fourth point we come to an exceedingly serious professional matter:

That it is essential to draw a strict distinction between professional conduct in the attention given to a patient and the nature of the exact professional treatment given to the patient, and that the propriety or otherwise of any particular method or line of treatment should not be made the subject of investigation in connexion with the insurance service.

As you, Sir, are aware, any doctor attending any individual is under a certain liability to render to that individual as a patient a reasonable degree of care and skill. If he fails to do that he is liable to be dealt with under legal proceedings. That responsibility exists in respect to all patients, under whatever system they may be attended—whether national insurance, contract practice of any kind, or as private patients. We recognize that the insurance practitioner has two responsibilities—first of all a responsibility to his patient as such, and secondly, a responsibility to the national health insurance administration, that he shall obey the regulations, and carry out the terms of service. And while we agree that it is quite proper that he should be dealt with under the machinery of the Act for any breaches of the regulations we entirely dissent from the view that it should be possible under the act of omission or commission in the treatment of his patient, or that his treatment of a case should be subject to review by those who have not seen the patient, nor gained any first-hand knowledge of the case, but who on reading the report may decide that he did or did not do a certain thing. We have a case in point in London, where a doctor attended a patient for a throat condition. The case was shown at the final court of inquiry to be very complicated, and because the doctor did not take a swab of the throat he had been fined by the department, although the court of inquiry made it perfectly clear that the doctor was not to blame in the treatment of the case—made it clear even to the extent of giving costs against the Insurance Committee. The department, still not having seen the patient, but only having read the report, fined the medical man for not having taken the swab-out of the throat. We cannot too strongly put the objection to any third party stepping in and saying that this or that should not be the way of treating a particular case. This perhaps is the strongest point we want to put to you. The whole independence and position of the doctor in the discharge of his responsibility for the treatment of the patient is entirely to be undermined if afterwards he is going to be subject to having his opinion as to what he should do or should not do reviewed by the department. We agree that if he neglects his patient, does not go when he is urgently summoned, and so forth, he breaks his terms of service and must be dealt with under the regulations. But as to the propriety of his general method of treatment of the patient we have the General Medical Council, which sets up a standard which we must all reach before we can be qualified, and having been qualified and placed on the *Register* we cannot see how it is possible to introduce any body who should have the right of saying that this or that should or should not be done. If the patient has a grievance which is good remedy in the court of law, and the recourse which is good enough for the ordinary public should be good enough for the insured person. We do not object to procedure under the regulations, but we think that purely professional matters should not be subject to review by the machinery of the Insurance Act.

Mr. CHAMBERLAIN: May I just put a couple of questions? I notice in your Memorandum of Evidence before the Royal

Commission—which I have read in part—you state that the action of the Ministry of Health has given rise to "a feeling of injustice, or even of a suspicion of vindictiveness." I wish you would elaborate that a little more.

Dr. DAIN: The question of vindictiveness was on the case of the £1,000 fine. That was the particular case.

Mr. CHAMBERLAIN: That was another way of saying that you thought the fine was too high. And what about "injustice"?

Dr. BRACKENBURY: That is not an opinion that we as a committee have expressed. We have brought to the notice of the Ministry a feeling widely current in the profession.

Mr. CHAMBERLAIN: What I wanted to see was the basis of that statement.

Dr. BRACKENBURY: I might remind you, Sir, that further action has been taken by the Ministry in respect to the case just mentioned.

Mr. CHAMBERLAIN: You mean it has been remitted?

Dr. BRACKENBURY: Yes.

Mr. CHAMBERLAIN: Then another sentence attracted my attention:

"When, however, agreements with the profession have been reached with regard to the machinery and procedure by which decisions shall be arrived at, it is exceedingly disquieting to find that, though the machinery is used and the procedure followed, there are cases in which there seems little or no relationship between the decisions of the Ministry and the reports or recommendations of the bodies on which action is supposed to depend."

That sounds rather as though you were of opinion that the Ministry had departed from the procedure laid down.

Dr. DAIN: No, but that they did not attach proper weight to the reports they received.

Mr. CHAMBERLAIN: I see.

Dr. DAIN: We have the right of appeal against the decision of the Ministry where the procedure has not been followed. But we have no appeal against a judgement on merit.

Mr. CHAMBERLAIN: But you do not deny that the responsibility lies upon the Ministry to take a final decision after consideration of the reports and recommendations?

Dr. DAIN: No.

Mr. CHAMBERLAIN: Do you want to say anything further?

Dr. BRACKENBURY: The four points we have brought forward are matters of extremely important principle; the last of them we consider to be professionally vital, the others also are of vast importance. All we are anxious to secure is that these principles as we laid them down rather carefully should be accepted by the Ministry. We may be wrong in our supposition that recent decisions of the Ministry have in fact departed from these principles; but they have seemed to us to raise the question whether these principles were not in danger of being departed from; and all we are anxious to secure is that the principles laid down in our evidence should be admitted and recognized by the Minister. If we have that assurance we shall be content to rely upon the action of the Ministry being consistent with the principles accepted. We are not discussing the merits of the particular cases: we are simply saying that these particular cases have raised in the minds of the Committee and of a large number of members of the profession the suspicion that perhaps these principles which seem to us of the utmost importance were not accepted by the Ministry, and we want to be assured, either that our principles are not in themselves just principles, or that the Ministry accepts them as just principles. If we have that acceptance we shall be quite content to believe that the acts of the Ministry will be in consonance with those principles.

#### *The Minister's Reply.*

Mr. CHAMBERLAIN: I thank you, Dr. Dain, for your opening words, and I assure all you gentlemen that I am very glad to have the opportunity of meeting you this afternoon and discussing these questions with you. I was glad to hear you say—what, indeed, you hardly needed to say—that your principal object was to establish a thoroughly satisfactory service, and that you feel your responsibilities in this matter. There, I think, we are both in agreement, and, as you know, it is my statutory duty also to satisfy myself that the service is satisfactory, and that full regard is paid to the conditions on which the service was originally established.

I confess that I have been very much astonished at the attention which seems to have been given to the cases which have recently occurred, and to which you have drawn attention. As far as I am concerned, it was quite a new idea to me that I was making any departure from the practice which had been previously followed by other Ministers, or that there was anything in the actual circumstances of the cases to which you refer which differentiated them from other similar cases, or which would give rise to anything in the nature of a protest on the part of the British Medical Association. But I would like to make a few comments upon the particulars which

you have put forward to the Royal Commission, and which no doubt the Royal Commission will weigh and take into account when they come to make their report.

The first of your four points is, I think, specifically directed to one particular case, and I think I understood from you, Dr. Dain, that your feeling was that the Ministry had ultimately to act as a judge in this matter, and it was rather taking the part of advocate in directing an investigating body to put forward a decision other than that which that body had already come to upon its own initiative. I do not think that is a correct way of estimating the action of the Ministry. It is true that the Ministry has to be the final judge in these cases. It is true that the Ministry is responsible for seeing that there is a satisfactory service.

Well, what happened in this particular case? There was a recommendation by the Medical Service Subcommittee that a substantial fine should be inflicted upon the particular doctor or doctors in question. The offence alleged was one of a very serious character indeed. You would not deny that for a moment. If that sort of thing were once to become prevalent—which I cannot imagine—the damage to the whole reputation of the service would be irreparable. It was a very serious case indeed, and the department felt that it was so serious that it could not be summarily dismissed without further investigation. I put some questions to you just now which were designed to ascertain what in your view the effect of the Ministry's action is. As you put it, it sounded as though the Ministry had directed the court of inquiry to bring in a verdict of guilty. But that is not a bit what happened. What the Ministry did, in effect, was to say, "Follow such a procedure as will enable us to have a further and more exhaustive inquiry into the circumstances of the case"—for, mind you, that was the inevitable result of the Ministry's action. I have pointed out that under the regulations when a recommendation is made by an Insurance Committee for the removal of a doctor from the medical list the Minister is bound to have, not a court of inquiry—if I may correct you—but a committee of inquiry. The distinction is important. A court may be asked to pass judgement; a committee is set up, not to pass judgement, not even to make recommendations as to action being taken, for if you consult the regulations you will find there is a difference between the procedure laid down for the Medical Service Subcommittee and that laid down for the court of inquiry—or, rather, the committee of inquiry (I am myself falling into your error). The committee of inquiry has merely to report on the facts.

The committee of inquiry investigated the facts in this complaint. They found a large number of cases, they did not investigate every one, but they investigated a sufficient number to show that the practice complained of had been largely followed. What did the Ministry do? Did they remove the man from the list? No; they did not. Is not that the answer to your suggestion? The representation that he should be removed from the medical list was the way of getting a fresh inquiry into the case, but the result of the inquiry was not that the practitioner should be removed from the list—which I suppose would mean ruin to him, or at any rate would be the most serious penalty that could be inflicted—but something which was in fact the original recommendation of the Medical Service Subcommittee. The practitioner was fined. You may have your own opinion as to whether that fine was excessive or not; there might be differences of opinion on that subject, but if the Minister, instead of fining the man £1,000—or withholding £1,000 of grant—had removed the offender from the list there would have been no possible complaint on your part.

Dr. DAIN: That all depends on the reading of the report.

Mr. CHAMBERLAIN: Anyhow, my point is this: if you say, as a principle to which you ask my adherence, that under no circumstances should the Ministry ask an Insurance Committee to adopt such a procedure as will enable a further and more exhaustive inquiry into the circumstances of a particular complaint than has already taken place in the informal procedure of the Medical Service Subcommittee, you are asking me to go further than I ought to go in view of my responsibility to the public.

Let us come to your second point: that when a complaint has been made in one prescribed form penalties should not be inflicted in respect of offences not formally alleged or of offences which, if alleged, should have been formulated in a different prescribed way and might have required a different line of defence. Well, now, I think I appreciate what is in your mind in formulating that principle. It is, I think, that it might be unfair to a man to bring an accusation against him of one offence, to let him defend himself on the supposition that that was the offence with which he was charged, and then to bring him in guilty of another offence, when, if he had known that the basis of accusation was going to be changed, he might have put up a different line of defence. I think if it is stated in that sort of way I should agree. But let us

again examine the circumstances of the particular case which illustrates your contention that the Ministry has violated that principle. Here we get on to ground which seems to me to approximate to your fourth point. I just wrote down what you said about that particular case. You said that the accused man was charged in the first instance with gross negligence; he was found innocent of that, but guilty of an error of judgement. Well, you do not find those words in the report of the committee of inquiry.

Dr. DAIN: Yes, Sir, you do find those words.

Mr. CHAMBERLAIN: You do not find that he was guilty of an "error of judgement." That is your gloss upon what they found.

Dr. DAIN: No; one of the committees, as a matter of fact, on that particular case did use those words.

Mr. CHAMBERLAIN: Perhaps I am at a disadvantage here in not being a doctor; perhaps, on the other hand, it is an advantage. Here you have a case of a child—a boy, was it not?—who suffers from some discomfort in the throat. The doctor says, "This is tonsillitis," and treats him for tonsillitis. Some of the doctors say at any rate that there were symptoms which ought to have pointed him to diphtheria, and this doctor subsequently turns out that it was diphtheria. Anyhow, it did not take a swab. Why? You say, "Error of judgement." But supposing I said, "No, I do not call that an error of judgement." His judgement might have been that it was of no use to take swabs from throats, that it furnishes no indication of diphtheria. But if the taking of swabs is a routine precaution to take in treating cases of this nature, neglect to take them is not an error of judgement. It is—shall I say?—a lack of alertness.

Dr. DAIN: I find that "error of judgement" was not used in respect to this particular case.

Mr. CHAMBERLAIN: It is awfully difficult, but what I am trying to put to you is that this case does not come under the definition of error of judgement, but that what might be properly alleged against this particular doctor, as it seems to me as a layman, is that he was not alert or quick enough in following what should have been his usual routine in taking a judgement, and which is want of, it may be, proper attention, or an instance of mere slackness or carelessness, if you like? You see, I think, that I accept your principle if it is stated in one way, but when it comes to the application of the principle it may be very difficult to decide whether in a particular case the principle is really involved or not. That makes it very difficult for me to say that I accept the words which you have put down here, when I might presently find myself by reason of my acceptance dealing with a case in which I should say that the principle was not involved, but somebody else might say that it was.

Your next point is that full consideration should be paid to the findings or recommendations of a committee (whether Medical Service Subcommittee or inquiry committee) which has itself investigated the details of the case in mitigation of the heinousness of the misconduct even when proved. I do not know on what ground you say that I have not paid full consideration to the findings or recommendations of a committee. I repeat again that recommendations are no part of the business of an inquiry committee. They are part of the business of a Medical Service Subcommittee, they are passed on from the Medical Service Subcommittee to the Insurance Committee. But in this case who was it that refused to accept the recommendations of the Medical Service Subcommittee? It was the Insurance Committee.

Dr. DAIN: No, they agreed in this particular case.

Mr. CHAMBERLAIN: Well, perhaps we are talking about different cases. In three of the four cases mentioned to me the recommendations of the Medical Service Subcommittee were not accepted by the Insurance Committee. The recommendations of the Medical Service Subcommittee was that a fine should be imposed; the Insurance Committee, on the contrary, made a representation that the doctor in question should be removed from the medical list.

Dr. DAIN: In the K— case, to which I referred in my opening remarks, the eventual result was that after the Medical Service Subcommittee had recommended that no action be taken, and this had been endorsed by the Insurance Committee, in face of that, and in spite of the extremely good record of the practitioner, a fine was imposed.

Mr. CHAMBERLAIN: Is all your point No. 3 based on the K— case?

Dr. DAIN: Yes, it is.

Mr. CHAMBERLAIN: Well, I know now what I have to answer. It seems to me that your strictures are a little severe if they are founded entirely upon a single case, and even in regard to that single case your account was not strictly accurate.

Dr. DAIN: We took trouble to make it accurate.

Mr. CHAMBERLAIN: You said that the practitioner had given one certificate without seeing the patient. He gave three certificates without seeing the patient.

Dr. DAIN: That was not proved against him before the Medical Service Subcommittee. It came from some other source.

Mr. CHAMBERLAIN: I have got the dates on which he saw the patient and the dates on which he gave the certificates, and they do not agree except in one instance. I do not think we need argue about it. If he had given only one certificate it would be very much less serious than three, as I think you will agree. But a man of good standing—a man of this kind, for I think this particular man is a man of good standing, and generally reckoned to be attentive to his patients—if he goes and makes three statements in the form of certificates without having seen his patient, surely that is a case which rather calls for some sort of action. If people of good standing are going to do that you can hardly expect people of less standing to set a higher standard. In this case he paid no visit between August 16th and October 10th—a period of nearly eight weeks.

Dr. DAIN: He was giving monthly certificates, and he missed one month.

Mr. CHAMBERLAIN: He gave two certificates—one on August 20th and one on September 20th; both were the results of or visit which was paid on August 16th. I do not know whether you gentlemen consider that to be a very small matter, but I do seem to me, I confess, not altogether a small matter, and to call for some sort of attention. In this particular case I do not think you would claim that the fine was very excessive. It was only £5, and I cannot see that any important matter of principle is really involved. I can always conceive that the decisions given by the Ministry will not satisfy everybody, and is only natural that there should be different ideas as to the amount of fine, but I really do not see that that particular case, admittedly the only one on which you found a charge against the Minister—

Dr. DAIN: No, we are not making charges, only bringing illustrations of the principle. We are not trying to be exhaustive in any way, we are giving you typical examples which illustrate the principle we wish to drive home.

Mr. CHAMBERLAIN: I am not making any complaint, you understand that, but I want to deal with the things fairly and sympathetically if I can. I am anxious to be of one mind with you in this matter.

The last point—the one to which you attach the greatest importance—is that it is essential to draw a strict distinction between professional conduct in the attention given to a patient and the nature of the exact professional treatment given to the patient, and that the propriety or otherwise of any particular method or line of treatment should not be made the subject of investigation in connexion with the insurance service. I think I have really said to you what I wanted to say about that. I should agree if you state it in that particular way; the real difficulty is the difficulty in practice of applying the principle to which everybody would attach importance.

Dr. BRACKENBURY: We should all agree that there is a good deal of difficulty in the applying of general principles. What we are concerned with at the moment is to establish that these are general principles. It would be a very great thing if we could secure an agreement that these were in themselves proper principles to apply. You used the word "strictures." We have not had it in our minds for one moment to bring any strictures upon the attitude of the Minister. People have thought that we ought to take serious action, but that is not our purpose. We are not concerned with the merits of the judgement in any one of these cases, but we do believe that there are features in one or other of these cases which illustrate the possibility of these principles not being recognized or being departed from. The trouble is partly that the nature of the judgement asked for is involved in the procedure taken. It is not a complaint or a representation by the Insurance Committee that this case should be inquired into and that some penalty should be inflicted. There are the two procedures: the penalty of removal from the panel is suggested in the one case, and the penalty of censure or a fine is suggested in the other; and it is quite possible to believe that the kind of defence which might be set up against removal from the panel would be somewhat different in character from the kind of defence set up in the other instance.

Mr. CHAMBERLAIN: If the result of the Ministry's intervention had been that this man was struck off the panel when the Insurance Committee had not originally recommended that course there would have been a good deal of force in your contention.

Dr. BRACKENBURY: May I say that that appears to be irrelevant? In each case, whatever the result, we should still have had the objection that after the Insurance Committee had

made its decision that the circumstances called for one kind of action, the Ministry stepped in and said, "Don't you think that under the circumstances this case calls for another kind of action?" What the Insurance Committee said was, "We believe this is a serious case and ought to be dealt with by a serious penalty, but we do not believe that it is a case in which the man ought to be struck off the panel." Then the Ministry came in and said, "Don't you think you ought to reverse that decision and have the man struck off the panel?" The motives are perfectly understandable, but the result of that action, of the Ministry stepping in, involves unfortunately a suggestion of what the penalty ought to be. The Insurance Committee suggests one kind of penalty and the Ministry steps in and suggests a different class of penalty. That leaves our point of principle untouched. If it is desired that the Ministry might have some method of more exhaustive inquiry before inflicting its penalty we should all agree.

Dr. CHAMBERLAIN: More exhaustive than what?

Dr. BRACKENBURY: More exhaustive than the Medical Service Subcommittee. If the Ministry had been able to step in and say, "Well, now, before we inflict even this penalty—a big fine—we think there ought to be more inquiry into this case than has already been made by the Medical Service Subcommittee," it would be quite desirable that machinery should be set up and regulations made to enable the Ministry to take that action, but under the existing circumstances the character of the judgement sought for is involved in the representations made, and for the body that has to give that judgement to step in and suggest to the complainant which kind of judgement should be sought for does seem to contravene the principle.

Dr. CHAMBERLAIN: We have not got any power of the kind I suggest. But may I put this to you as a further consideration? I do think it is desirable that there should be some standard of uniformity in the treatment of these cases throughout the country. If the Minister was simply to accept the verdict of the Medical Service Subcommittee in each case, without taking any further trouble to investigate the case and exercise his own judgement, what guarantee would you have that there would not be very different standards of penalty inflicted in different parts of the country? The Minister has been brought in largely for the purpose of ensuring that there shall be some sort of uniformity in practice. The present system may not be perfect. I confess I have not given attention to seeing whether the machinery could be improved. I rather wish you had put up to the Royal Commission some specific ideas as to how this machinery could be improved.

Dr. BRACKENBURY: We have, Sir.

Mr. CHAMBERLAIN: Oh, you have; then perhaps that might meet the case. I hope I have convinced you that injustice has not been done, and that most certainly vindictiveness has not been in the mind of the Minister, but that by the way the regulations are formed—and formed with the help and acquiescence of the Insurance Acts Committee—the only way in which the Minister can have a further inquiry is the way that has been indicated.

Dr. BRACKENBURY: I think I can say that we see the motive in the minds of the Ministry much more clearly now. At the same time the method does seem to violate the principles laid down. Take the representations of the Medical Service Subcommittee or the findings of fact of the committee of inquiry. The committee finds certain facts and draws certain inferences, and as a result expresses the opinion that what has happened amounts to an error of judgement and not to gross negligence. The Ministry say, "We accept the findings of fact of the committee of inquiry, but we differ from them in their opinion. They, having heard the case and having found these facts, express the opinion that the doctor has committed an error of judgement. We, having read the facts and accepting those facts, come to the conclusion that it was not an error of judgement, but gross negligence, and we inflict a certain penalty." It does seem to us that those people who heard the witnesses and had the full facts before them in inquiry were in a better position to form an opinion as to whether this was an offence of greater or less heinousness on the part of the doctor than the Minister can possibly be. We do think it is an important principle that, whatever the opinion of the committee of inquiry may be, it should be given full weight to by the Ministry, and we conceive that in a case like that the opportunity for forming a correct and wise judgement is greater for the committee than it can possibly be for the Minister. In this final judgement we want to assure ourselves that full weight will be given to any mitigating circumstances or opinions expressed by the committee.

The fourth point we consider professionally vital. We think it is possible to draw a distinction between neglect of a patient and the wisdom or unwisdom or the character generally of the professional treatment or advice given. If a man is asked to go to a case and does not go, or refuses to perform such services as his contract he ought to perform, we recognize that machinery is available for punishing him. But our

relation to our insured patients is exactly the same as to our private patients. We undertake to give such knowledge and skill as we are possessed of, and such attention as we can to every case. If we do not, there is a remedy. But we do not believe that there should be set up in the department any power of reviewing a man's professional judgement in respect to the character of the advice and treatment he provides. That seems to us professionally—not merely as insurance practitioners—a vital professional point. We could not allow any authority or department of State to say, "Dr. A and Dr. B have both of them given their best to this case, but Dr. A (or Dr. B) has pursued (or has not pursued) the line of treatment or advice which we think to be the accepted and proper one." Or we could not allow the Minister to say that the standard of professional skill—

Mr. CHAMBERLAIN (interrupting): Nobody at the Ministry has made any such claim. I think you are dragging your coat-tails rather conspicuously.

Dr. BRACKENBURY: It has occurred to us that in one of these London cases, if not both of them, there was distinctly a tendency for the Ministry in the judgement and in the letters it has written to use the words "standard of treatment" in a way in which we had never conceived that those words "standard of treatment" could be used. To apply the term "standard of treatment" to the kind of advice or treatment given or to the relative merits of the professional skill of different doctors, supposing that they both do their best, seems to us to be entirely improper, and if we have the assurance that the Ministry of Health will not use the term in that way we are perfectly satisfied. It did seem to us that it was being applied in that way in some of these cases. It is perhaps a little difficult to make clear. There may be cases—though I do not conceive them very easily—in which it is difficult to apply; but the point seems to us very vital, and if we have your assurance that you appreciate it we shall be satisfied.

Mr. CHAMBERLAIN: I have no hesitation in giving you that assurance. One result of our discussion has been to show—certainly it has shown me—what is really the source of all the uneasiness you have felt. I believe that to be founded upon a misapprehension of what has been in the minds of the department. There may have been in the past—and there may be in the future—differences of opinion as to whether in a particular action of this department we have gone over the border-line of that principle, but we have not done so intentionally. We fully recognize the importance of the principle as you have laid it down in general terms, and there is not the slightest intention to lay claims to prescribe as to professional treatment or to assess the standards of professional treatment by members of the profession.

### The New Pensions Bill.

Dr. BRACKENBURY, before the deputation broke up, drew the Minister's attention to the provisions of the new Pensions Bill whereby many persons who had been in national health insurance for a time and had passed out became eligible for the new pensions, and in entering for them would have to re-enter for national health insurance. Anyone who at any time had been insured for two consecutive years might come in, and it was conceivable that there were very large numbers of persons who would desire to enter for pensions, and in so doing would enter for insurance, although they would not desire to enter for insurance by itself. Thousands of women employed during the war were in national health insurance for the consecutive period of two years, and were now married and in fairly comfortable circumstances.

Mr. CHAMBERLAIN pointed out that under Clause 13 of the measure married women were not allowed to come in as voluntary contributors. He thought that, apart from married women, the numbers concerned would be very small.

Dr. BRACKENBURY agreed that that minimized the difficulty considerably. At the same time there were persons who were employed in various capacities during the war which brought them within the provisions of national health insurance for at least two years, and were now in fairly good positions (he was not now speaking of married women), and would not think it worth while to be voluntary contributors, even if they could, for the sake of medical benefit, but would be very glad to come in for the sake of the pensions. Was it necessary to bring again into national health insurance those who had been out of it for years, and who would not desire to re-enter for that purpose only?

Mr. CHAMBERLAIN said that he would be very glad to look into the question and see what there was in it. It would come in when they got the bill into committee.

Dr. DAIN expressed to the Minister the thanks of the Insurance Acts Committee for receiving the deputation and for the very obvious care he had taken to deal with all the points they had to raise.

## ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE.

thirty-second meeting of the Royal Commission on National Health Insurance was held at the Home Office on June 18th, and Lawrence of Kingsgate in the chair.

Evidence as to the supply of medicines, drugs, and appliances under the insurance scheme was submitted by the Retail Pharmacists' Union, represented by Mr. A. R. Melhuish and G. A. Mallinson; and by the Incorporated Society of Pharmacy and Drug Store Proprietors, represented by Mr. W. Atrods and Mr. A. Hutchinson. Thereafter Sir E. Cooper, M.D., and Dr. James Mennell, representing the Incorporated Society of Massage and Medical Gymnastics, gave evidence on the question of including massage and medical gymnastics in the insurance scheme; and evidence as to dental benefit was given on behalf of the Ivory Cross organization by W. F. Mellersh, Mr. C. Davis, Mr. H. D. Grant, Mr. John H., and Miss A. E. Fletcher.

Proof copies of the oral evidence and the relative statements submitted at the meeting of May 28th may be obtained from 1. Stationery Office, Adastral House, Kingsway, W.C.2, on licence of cost (2s. 3d.) and postage.

## RETURN OF MEDICAL RECORD CARDS TO INSURANCE COMMITTEE UPON TRANSFER OF A PRACTICE.

The following letter, dated June 17th, 1925, has been addressed to the Ministry of Health to the clerks of all Insurance committees:

"I am directed by the Minister of Health to state that he has under consideration representations from the Insurance Acts Committee of the British Medical Association in regard to the procedure to be followed in dealing with the forms of medical record in cases of transfer of practice.

"It is understood that in some areas the forms of record are transferred to the successor to the practice and held by him until called for by the Insurance Committee in cases where the insured persons select (or are assigned to) another doctor or cease to be entitled to medical benefit. In other areas the cards are retained by the Committee and issued to the successor or to other doctors as the insured persons make fresh selection or are assigned. It has been represented by the Insurance Acts Committee that from the practitioner's point of view the former procedure is strongly to be preferred; and while the Minister does not question the right of a Committee to follow the second alternative, he considers that, in the majority of cases, the first alternative affords the balance of advantage to the practitioners and insured persons concerned, and should not involve any substantial increase of work to the Committee. In the absence, therefore, of any exceptional circumstances, he would be glad if Committees would give careful consideration to the question with a view to the adoption of this course.

"It is suggested that the records should be transferred to the successor to the practice through the office of the Committee. Except in cases where the Committee is engaged in a general clearance of the medical register, the Minister would deprecate the 'clearance' of individual lists which come in this manner into the hands of the Committee. But while there are objections to the 'clearance' of individual lists (in the sense of the comparison of the doctor's list with the index register), it is suggested that the opportunity might be taken to remove any internal discrepancies in the doctor's list, such as failure to associate a continuation card with the appropriate record envelope, or the presence in the same list of a record card and a notification from the Insurance Committee that the insured person has been removed from the list. In areas where the doctor is not supplied with a form of notification of removal designed to be inserted in the appropriate position in the doctor's register, the Committee would remove any records in respect of persons notified to the doctor as having been removed from his list which the doctor has failed to surrender."

## DAUGHTER OF MEDICAL RECORD ACTS, 1920 AND 1923.

THE Home Secretary gives notice that he has withdrawn from William Walter Banbury of 73, Newington Butts, London, the authorizations granted by the Regulations made under the Dangerous Drugs Act, 1920, to persons who lawfully keep open shop for the retailing of poisons in accordance with the provisions of the Pharmacy Act, 1868, as amended by the Poisons and Pharmacy Act, 1908, to be in possession of and supply raw opium and to carry on the business of manufacturing, selling, or distributing the drugs to which Part III of the Dangerous Drugs Act, 1920, applies. Any person supplying Banbury with raw opium or any of the drugs to which Part III of the Dangerous Drugs Act, 1920, applies will be committing an offence against the Acts.

## Naval and Military Appointments.

### ROYAL NAVAL MEDICAL SERVICE.

SURGEON COMMANDER J. H. LIGHTFOOT is placed on the retired list, with the rank of Surgeon Captain.  
Surgeon Commander R. N. W. W. Biddulph to the Effingham as Fleet Medical Officer and Specialist in Ophthalmology on commissioning.  
Surgeon Lieutenant R. J. Prendergast to the Victoria.  
Mr. E. B. Pollard has entered as Surgeon Lieutenant and appointed to R.N. Hospital, Haslar.

### ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Lieutenant Commander A. G. Reade, O.B.E., to the Ramillies for fourteen days' training.

### ROYAL ARMY MEDICAL CORPS.

Captain D. A. Chalmers is granted the temporary rank of Captain and relinquishes the rank of Captain.

### ROYAL AIR FORCE MEDICAL SERVICE.

Wing Commander A. S. Glynn to Headquarters, Cranwell.  
Flight Lieutenant W. G. L. Wambeck is promoted to the rank of Squadron Leader.  
on to R.A.F. Officers' Hospital; T. R. S. to Area; R. S. Topham to R.A.F. Depot; Inland Area.  
Depot on transfer to Home Establishment.  
F. P. Scholfield to Station Commandant, Iraq; A. Harvey to Headquarters, Egypt.  
Flying Officer L. P. McCullagh is granted a permanent commission in the rank stated.

### REGULAR ARMY RESERVE OF OFFICERS.

#### ROYAL ARMY MEDICAL CORPS.

Major C. H. Hopkins, having attained the age limit of liability to recall, ceases to belong to the Reserve of Officers.

### TERRITORIAL ARMY.

#### ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel W. Bowater, M.C., to be Brevet Colonel.  
Major H. F. Humphreys, M.C., to be Lieut.-Colonel and to command the 10th (South Midland) Field Ambulance, vice Lieut.-Colonel (Brevet Colonel) W. Bowater, vacated on completion of tenure of command.  
Captain F. M. Halley has been restored to the establishment.  
Supernumerary for Service with the O.T.C.—Major A. E. Webb-Johnson, C.B.E., D.S.O., T.D., resigns his commission, and is granted the rank of Colonel, with permission to wear the prescribed uniform.

## VACANCIES.

BIRMINGHAM CITY.—Assistant Medical Officer at one of the City Mental Hospitals. Salary £350 per annum, rising to £400.  
BIRMINGHAM AND MIDLAND HOSPITAL FOR SKIN AND URINARY DISEASES.—Honorary Surgeon.  
BLOOMSBURY DISPENSARY, 12, Bloomsbury Street, W.C.1.—Resident Medical Officer (male). Salary commencing £250 per annum.  
BOLINGBROKE HOSPITAL, Wandsworth Common, S.W.11.—Honorary Assistant Surgeon to the Ear, Nose, and Throat Department.  
BOLTON UNION.—Second Assistant Medical Officer for the Townley's Hospital, Farnworth. Salary £225 per annum.  
BRADFORD ROYAL INFIRMARY.—Resident Surgical Officer (male, unmarried). Salary £250 per annum.  
BURY COUNTY BOROUGH.—Assistant Medical Officer of Health, Assistant School Medical Officer, and Assistant Tuberculosis Officer. Salary £600 per annum.  
CAMBRIDGE: ADOENBROOKE'S HOSPITAL.—House-Surgeon (male, unmarried). Salary at the rate of £130 per annum.  
CHESTER ROYAL INFIRMARY.—Honorary Assistant Surgeon.  
CITY OF LONDON HOSPITAL FOR DISEASES OF THE HEART AND LUNGS, Victoria Park, E.2.—(1) Resident Medical Officer. (2) House-Physician. Salary at the rate of £250 and £100 per annum respectively.  
CROYDON GENERAL HOSPITAL.—Casualty House-Surgeon. Salary £103 per annum.  
DOVER BOROUGH.—Assistant Medical Officer of Health. Salary £750.  
DUDLEY: GUEST HOSPITAL AND EYE INFIRMARY.—(1) House-Surgeon. (2) Assistant House-Surgeon. Males. Salary £175 and £150 per annum respectively.  
DUMFRIES AND GALLOWAY ROYAL INFIRMARY.—Junior Resident Medical Officer. Salary £125 per annum.  
EDINBURGH: ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN.—Five Honorary Resident Medical Officers.  
HENDON: COLINDALE HOSPITAL.—Junior Assistant Medical Officer (male, unmarried). Salary £500 per annum.  
HERMITAGE SANATORIUM, Whitwell, near Ventnor.—Resident Medical Officer. Salary £350 per annum.  
HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.—House-Physician. Honorarium £50 for six months.  
HULL: SCULCOATES UNION INFIRMARY.—Resident Assistant Medical Officer. Salary £350 per annum, rising to £400.  
IROMBURY DISTRICT COUNCIL.—Assistant Medical Officer of Health. Salary £500 per annum.  
KENSINGTON, FULHAM, AND CHelsea GENERAL HOSPITAL, Richmond Road, S.W.5.—Second Anaesthetist (male). Honorarium 10 guineas.  
LIVERPOOL: ST. PAUL'S EYE HOSPITAL.—Two Honorary Surgeons.  
LONDON COUNTY COUNCIL.—Junior Assistant Medical Officer (unmarried) at the Manor, Epsom. Salary £300 per annum, rising to £400, and also temporary additions on Civil Service scale, at present £140 a year.  
LONDON LOCK HOSPITAL, Harrow Road, W.9.—Second House-Surgeon at the Female Hospital. Salary £150 per annum.  
LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE, Endsleigh Gardens, N.W.1.—Lecturer on Tropical Medicine. Fee 200 guineas per annum.  
MANCHESTER ROYAL INFIRMARY AND DISPENSARY.—Honorary Assistant Gynaecological Surgeon.  
NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square.—Assistant-Physician.  
NEW ZEALAND GOVERNMENT.—Two Assistant Medical Officers Hospitals Department. Salary £615 per annum.

PORTH AND DISTRICT HOSPITAL, Glamorgan.—Resident Surgeon. Salary £750 per annum.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL, King William Street, W.C.2.—Refraction Assistant. Salary at the rate of £100 per annum.

ST VINCENT'S ORTHOPAEDIC HOSPITAL, Eastcote, Middlesex.—Resident Medical Officer (male, unmarried). Salary at the rate of £150 per annum.

SCUTHORPE AND PROUDINGHAM URBAN DISTRICT COLLEGE.—Medical Officer of Health. Salary £800 per annum.

SHEFFIELD: JESSOP HOSPITAL FOR WOMEN.—Senior Resident Officer in the Gynaecological and Maternity Departments (male). Salary at the rate of £250 per annum.

SHEFFIELD UNIVERSITY.—Assistant Pathologist to the Hospitals and Demonstrator of Pathology in the University. Salary £300 per annum, rising to £350 after one year.

SUDAN GOVERNMENT.—Assistant Bacteriologist at the Wellcome Tropical Research Laboratories, Khartoum (unmarried). Initial rate of pay £E.720 per annum, rising to £E.1,200.

SUNDERLAND ROYAL INFIRMARY AND CHILDREN'S HOSPITAL.—Honorary Surgeon for Nose, Throat, and Ear Work.

SURREY COUNTY COUNCIL.—Assistant Medical Officers in the Public Health Department. Males. Salary £600 per annum, rising to £700.

SWINDON BOROUGH EDUCATION COMMITTEE.—Dental Surgeon. Salary £500 per annum.

VICTORIA HOSPITAL FOR CHILDREN, Tile Street, Chelsea, S.W.3.—(1) House-Physician. (2) House-Surgeon. Salary at the rate of £100 per annum each.

WEST HAM UNION.—District Medical Officer (male). Salary £450 per annum, rising to £700, with bonus, at present £214, and £50 annually for upkeep of motor car.

WESTERN OPHTHALMIC HOSPITAL, Marylebone Road, N.W.1.—Honorary Assistant Surgeon. Honorarium 100 guineas per annum.

WESTMORLAND COUNTY EDUCATION COMMITTEE AND KENDAL BOROUGH EDUCATION COMMITTEE.—Registered Dental Practitioner. Salary £500 per annum.

CERTIFYING FACTORY SURGEONS.—The Chief Inspector of Factories announces the following vacant appointments: Lounhead (Edinburghshire), Clunleigh (Devon).

Correction.—In the announcement of vacant professorships at the Patna Medical College published in our issue of May 23rd, the sum for overseas pay should have been £25 per mensem, and not Rs25 as printed.

This list of vacancies is compiled from our advertisement columns, where full particulars will be found. To ensure notice in this column advertisements must be received not later than the first post on Tuesday morning.

### APPOINTMENTS.

HOSKINS, W. D., M.R.C.S., L.R.C.P., Certifying Factory Surgeon for the St. Just District, co. Cornwall.

INGRAM, John T., M.B., B.S.Lond., Physician to Out-patients at the Evelina Hospital for Sick Children, Southwark.

KNIGHT, H. E., M.D.Lond., Honorary Physician to Rotherham Hospital.

LONG, Geoffrey B., M.A.Cantab., D.O.Oxon., M.R.C.S.Eng., Honorary Ophthalmic Surgeon to the Royal East Sussex Hospital, Hastings.

MADDER, Frank Cole, M.D.Melb., F.R.C.S.Eng., Emeritus Professor of Surgery in the Royal School of Medicine, Cairo, and Consulting Surgeon to the Kasr-el-Ainy Hospital.

SYMONS, A. D., M.D., M.R.C.S., D.P.H., Medical Officer of Health and School Medical Officer, Shrewsbury.

### DIARY OF SOCIETIES AND LECTURES.

#### ROYAL SOCIETY OF MEDICINE.

Annual General Meeting of Fellows: Wed., 5 p.m. To receive Annual Report of Council; election of Officers and Council for Session 1925-26.

INTERNATIONAL TUES. to SAT. 1, Wimpole St. National Del Connaught 1 Wed., 9 p.m. Broglie (Par 7.45 p.m., Di Mackenzie I ster, S.W.1.— of Medicine, ting of Inter- the Duke of papers daily, the Duc de Laboratory; Fri., 9 p.m., ynihan.

#### POST-GRADUATE COURSES AND LECTURES.

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION, 1, Wimpole Street, W.1.—Lecture arranged by the Fellowship of Medicine and open to all members of the medical profession. Fri., 5.30 p.m. Urinary Infections. London Temperance Hospital, Hampstead Road, N.W.1: Special Post-graduate course for practitioners. Second week. Daily, 4.30 to 6 p.m. Clinical Demonstration for one hour on Medical and Surgical Cases, the Ultra-violet Lamp, and Some Syphilis Skin Lesions. Lecture for half an hour. St. Peter's Hospital, Henrietta Street, W.C.2: Post-graduate Course in Urology. Clinical work every afternoon in the Hospital. Lectures: Mon., Genito-urinary Tuberculosis; Tues., Urinary Calculi; Wed., Urinary Antiseptics; Thurs., Non-tuberculous Infections of the Urinary Tract; and Fri., Urinary Obstruction.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.1.—Thurs., 4 p.m., Cerebro-spinal Fluid in Health and Disease.

LONDON SCHOOL OF DERMATOLOGY, St. John's Hospital for Diseases of the Skin, Leicester Square, W.C.2.—Tues., 5 p.m., Diseases of Nails. Thurs., 5 p.m., Psoriasis.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Tues., 4.30 p.m., Diagnosis of the Infectious Fevers (at the 'Ann's Road, N.15). Fri., 4.30 p.m., Exp Inpatient and Out-patient Clinics, Demos

QUEEN CHARLOTTE'S MATERNITY HOSPITAL, Marylebone Road, N.W.1.—Thurs., 5 p.m., Intracranial Haemorrhage.

SOUTH-WEST LONDON POST-GRADUATE MEDICAL ASSOCIATION, St. James's Hospital, Ouseley Road, Batham, S.W.—Fri., Visit to the Lister Institute of Preventive Medicine.

TAVISTOCK CLINIC FOR FUNCTIONAL NERVE CASES, 51, Tavistock Square, W.C.1.—Tues., 5.30 p.m., Analytical Methods.

WEST LONDON HOSPITAL POST-GRADUATE COLLEGE, Hammersmith, W.—Mon., 12 noon, Applied Anatomy. Tues., 2 p.m., Operations. Wed., 2.30 p.m., Surgical Wards. Thurs., 10 a.m., Neurological Department. Fri., 12 noon, Modern Methods in Medicine. Sat., 10 a.m., Medical Diseases of Children. Daily 10 a.m. to 6 p.m., Sat. 10 a.m. to 1 p.m., In-patients, Out-patients, Operations, Special Departments.

BIRMINGHAM UNIVERSITY CLINICAL HOURS.—At General Hospital: Tues., 3.30 to 5 p.m., Present Position of Insulin Treatment.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION.—At Royal Infirmary: Mon. and Tues., 9.30 a.m., Clinical Surgery; Tues., 10 a.m., Dermatology. At Western Infirmary: Clinical Gynaecology, Tues. and Thurs., 3 p.m.; Dermatology, Mon. and Wed., 9.15 to 10.30 a.m., and Thurs., 2.30 to 3.30 p.m. At Royal Hospital for Sick Children: Daily (except Sat.), 9.15 to 11 a.m., Diseases of Children.

### British Medical Association.

OFFICES, BRITISH MEDICAL ASSOCIATION HOUSE,  
TAVISTOCK SQUARE, W.C.1.

#### Reference and Lending Library.

As announced at page 223 of the SUPPLEMENT, the Reference and Lending Library is closed until July 15th.

#### Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager. Telegrams: Articulate Western, London).

MEDICAL SECRETARY (Telegrams: Medisecra Western, London).

EDITOR, British Medical Journal (Telegrams: Allotology Western, London).

Telephone numbers of British Medical Association and British Medical Journal, Museum 5351, 5352, 5353, and 5354 (internal exchange, four lines).

SCOTTISH MEDICAL SECRETARY: 6, Drumshengh Gardens, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 421 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

#### Diary of the Association.

##### JUNE.

- 26 Fri. London: Scholarships and Grants Subcommittee, 2.30 p.m. Sur-ex Branch: Annual Meeting, Blatchington Court Hotel. Luncheon, 1 p.m. Meeting, 2.15.
- 27 Sat. Aberdeen Branch: Stoddard Hotel, Largsmouth. Conjoint Meeting with Northern Counties Branch, 12 noon. Luncheon, 1 p.m. Dinner, Station Hotel, 6.30.
- Northern Counties of Scotland Branch: Annual Meeting, Stoddard Hotel.
- 30 Tues. London: Naval and " " " 5 a.m. North Lancashire " " " Branch: Annual Meeting, Galgar. Address by Dr. John Hay on the Significance of Raised Blood Pressure, 3.15 p.m.
- South-West Wales Division: Annual Meeting, Ivy Bush Hotel, Carmarthen, 3 p.m.

##### JULY.

- 1 Wed. South-Eastern Conjoint Division: Railway Hotel, Newlown St. Boswells. Address by Dr. Ernest Muir on the Changed Aspect of the Leprosy Problem, 3 p.m.
- Rochdale Division: Wellington Hotel, Rochdale, 8.30 p.m.
- 2 Thurs. London: Organization Committee, 2.30 p.m. Dudley Division: Garden Party, "Redlands," Stourbridge, 3 p.m.
- North of England Branch: Annual Meeting, 7, Windsor Terrace, Newcastle-on-Tyne, followed by Luncheon and Annual Golf Competition.
- 3 Fri. London: Committee on Drug Addiction, 3 p.m.
- 7 Tues. London: Science Committee, 2.30 p.m. St. Pancras Division: Inaugural Meeting, Midland Hotel, St. Pancras. Address by Mr. Bishop Harman on Some Common Eye Conditions, 8.45 p.m.
- 8 Wed. Norfolk Branch: Annual Meeting, Norfolk and Norwich Hospital. Address by His Honour Judge Herbert Smith, on The Law and Procedure under the Workmen's Compensation Act, 3.15 p.m. Tea, 6.30.
- 10 Fri. Border Counties Branch: Annual Meeting, Cumberland Infirmary Carlisle, 3.45 p.m. Branch Council, 3.15 p.m. Oxford and Reading Branch: Annual Meeting, Radcliffe Infirmary, Oxford, 3 p.m. Collier Cup Competition during the morning.
- North Wales Branch: Annual Meeting, Carnarvon. East York and North Lincoln Branch: Annual Meeting, Grimsby and District Hospital, 3 p.m.
- 13 Mon. Opening of the New House of the British Medical Association by His Majesty King George, accompanied by Her Majesty Queen Mary, 3 p.m.

### BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcement of Births, Marriages, and Deaths is 9s., which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

#### BIRTHS.

MILNE.—At 18, Walker Street, Edinburgh, on June 12th, to Dr. and Mrs. C. G. S. Milne, MacRobert Hospital, Cawnpore, India, a son.

LARGE.—On June 17th, at Barton House, Didbury Park, Manchester, to Dr. and Mrs. C. P. Large, a daughter.

TISLER.—On June 18th, at Elmurst, Carlton Road, N., Weymouth, to Dr. and Mrs. H. L. Tisler, a son.

#### MARRIAGES.

MCPHERSON.—LOGAN.—June 16th, 1925, at May Street Presbyterian Church, by the Rev. Wille Blue, Dr. David Gordon Stewart Macpherson, youngest son of Mr. and Mrs. Thomas S. Macpherson, 8, Cliftonville Avenue, Belfast, to Catherine Douglas Logan, youngest daughter of Mr. and Mrs. Collie Logan, Lauriston, Osborne Park, Belfast.

WALKER.—Savage.—June 13th, at St. Mary's Church, Beverley, Joseph, only son of Mr. and Mrs. J. Walker of Coullier, Lanarkshire, N.B., and Mrs. George Savage of Beverley.

(a) widows and their children, (b) children without parents, (c) unmarried mothers and their children, (d) deserted children.

4. To inquire into the existing provision in public institutions for the care and treatment of mentally defective persons, and to advise as to whether more efficient methods can be introduced, especially as regards the care and training of mentally defective children, due regard being had to the expenso involved.

5. As regards cost of relief of the destitute poor generally, to inquire as to whether any change in the law is desirable towards securing more equitable chargeability on local rates for persons who, having been in fact normally resident in one poor relief district, have become a charge upon the rates of another district.

#### HARVEY LEWIS BEQUEST FOR DUBLIN HOSPITALS.

Judgement was given in the case in which the claims of the Dublin hospitals had been heard in connexion with the disposition of a sum of about £22,000, available under the will of Mrs. Jane Isabella Lewis, widow of John Harvey Lewis, some time member of Parliament and high sheriff for County Kildare. By her will Mrs. Lewis directed that, after the death of certain life-tenants, the trustees should possess all the proceeds of the sale of her real estate in Ireland, upon trust, to lay out and expend the sum of £80,000 for erecting in Dublin a hospital in memory of her husband, to be called "The Harvey Lewis Memorial Hospital." She died within three months of the execution of the will—August 7th, 1904—and under the statutory provisions the total sum that would have been available for the charity from the real estate was not forthcoming. A Dublin cabman, William Browne, had been found to be the heir-at-law. On the disposition of the lady's personal estate it was found that from the general residuary estate only about £22,000 remained to be devoted to the erection and upkeep of a hospital, and the bequest could not, therefore, be applied for that purpose. The Court had to apply the sum as far as possible in accordance with the wishes of the testatrix, for which purpose all the Dublin hospitals were notified. Mr. Justice Meredith said that he was satisfied that the best way in which the fund could be devoted, in accordance with the views of the testatrix, was to complete the Royal Victoria Eye and Ear Hospital, Adelaide Road, Dublin, by building a proposed new wing. When the miscarriage of the original intention—that of erecting a new hospital—occurred, he felt that the project must be cut down to that of erecting a distinct part or wing of a hospital in Dublin, to be called "The Harvey Lewis Memorial Wing." He formed the opinion that it was imperative to keep the whole fund together. Counsel for the Attorney-General raising no objection, Mr. Justice Meredith allowed all the twenty-five claimants their costs out of the fund.

## France.

[FROM OUR OWN CORRESPONDENT.]

REGARDLESS of all criticism, the Chamber has passed the bill establishing a system of general medical insurance. The Senato will be called to give its decision pretty soon, and in the meantime all our scientific and professional organizations are mobilized to prevent harm or injustice. At the Académie de Médecine Professor Weiss, the dean of the Strasbourg faculty, himself an Alsatian, urged his colleagues to oppose a system copied from one the results of which he had been called upon to observe at very close quarters. Professor Weiss was careful to avoid treading on political ground, but he opposed our traditional sense of freedom to "corporalisation." As a citizen he dreads what he called wholesale medicine. As a medical man he fears the power of that anonymous machinery, the great trusts. As a professor he shudders to think of the baneful influence such a law may have on the teaching of students, and more especially on the moral conditions of the practice of medicine. To sum the matter up in one word, for him insurance means commercialization. The insurance system as it is contemplated would, he considers, certainly lower the standard of the profession, but the principal sufferer will be the sick. Professor Weiss must certainly have felt that he was supported by the unanimous feeling of his colleagues

in the learned Académie. He might have felt, too, the throbbing of the heart of the rank and file of the profession at large. What Professor Weiss left unsaid was that, though a question of such wide importance was at stake, our Académie de Médecine was not even asked to give its opinion or advice. Well, they are going to do so.

#### Antisymphilitic Vaccination.

Dr. Doleris on March 10th read a paper to the Académie on the work of Jauregui and Lancelotti of Buenos Aires, who have just arrived in Paris to ask that their experimental work may be controlled. They have produced in the llama experimental syphilis with an evolution quite comparable to human syphilis. Cerebral lesions are produced, hereditary lesions are observed, and cultures of treponema have been obtained. Experimental inoculation from man to animal has proved possible, and accidental inoculation from animal to man has occurred. Sero-therapy was successful in the four cases that have been followed in men. In the discussion Dr. Jeanselme pointed out that the more striking the results the more severe must be the control. It is worth while to recall that in 1552 a Spanish historian, Gomara, wrote about a disease transmitted from llama to man and brought back to Spain by the expeditionary forces.

#### Professor Jacobacus.

At the request of the association of the Paris faculty for the furtherance of medical relations, Dr. H. C. Jacobacus of Stockholm delivered a remarkable lecture on thoracoscopy and described his method of canterizing pleural adhesions in artificial pneumothorax. The process was illustrated by fine lantern slides, and the lecturer was received with great enthusiasm. The next morning he gave a clinical demonstration of his technique at the Hôpital Laënnec. May the success of such a visit help to pull down the Chinese wall of scientific nationalisms. A very gratifying symptom of the modern and liberal spirit of our old *alma mater* is the appointment of foreign assistants to our clinical professors. At the Enfants Malades Hospital Professor Nobécourt is giving his demonstrations to students with the able assistance of Dr. W. S. Copeman (M.B., B.Ch.Cantab.). This is certainly a rare opportunity given to our young confreres from abroad, and at the same time enables our students to come into contact with the spirit and methods of the British schools.

#### Antityphoid Vaccination in the Navy.

Interesting statistics have been published of the progress of antityphoid vaccination in the navy. It must be understood that our sailors are far more exposed to infection than soldiers in our army, being oftener employed in endemic centres. The navy morbidity was 1.9 per mille (as compared with 6.15 in 1912) and the mortality 0.09 (against 0.77). Vaccination is now performed by giving one injection only, generally with Le Moignie's lipo-vaccine. Formerly four injections with the vaccine of Chantemesse were given. The reactions are so mild as not to be worth mentioning. In some cases where there seems to be a contraindication Lumière's entero-vaccine is given by the mouth. Since 1915 not a single fatal accident has been recorded following vaccination. We can safely look forward to the time when typhoid shall be stamped out from the navy. Yet how often do we hear some fool asserting that medicine does not progress!

#### The Medical "Salon."

For the fifth time is being held an exhibition in Paris of works of art by medical men. Painting and sculpture are well represented, and the majority of works are well above the standard of amateurism. Some of the artists are highly reputed in our professional circles, and the catalogue brings together names such as those of Professor Hayem, Laignel-Lavastine, Caussade, Paul Legendre, Sabouraud. They remind us of our great Ingres the painter, who was never so pleased as when he was congratulated on his achievements as a violinist.

G. MONOD.

## Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT.]

THE House of Commons has this week passed the Army and Navy Estimates through report. During the debate on the Navy Estimates, on March 19th, Lady Astor referred to the prevalence of tuberculosis among writers in the navy, not only the British navy, but the United States navy. She said this was very difficult to combat, but she hoped the Government would leave nothing undone. No answer was returned from the Government Bench. The Consolidated Fund Bill was made the opportunity for important debates on moves towards European peace and on unemployment at home. The minor members of Parliament of the Labour party brought forward their Mines Minimum Wage Bill. The Summer Time Bill has had a rapid journey through Committee, but there is no progress to report on the Nurses Registration Bill or on the Mental Defectives Bill. The Therapeutic Substances Bill was read a third time by the House of Lords on March 19th and sent to the House of Commons. Lord Birkenhead, Secretary for India, introduced in the House of Lords, on March 19th, a Government of India (Civil Services) Bill which would exempt from submission to Indian legislatures certain proposals dealing with salaries, pensions, and payments; it was read a first time.

The House of Commons will adjourn for the Easter recess from April 9th till April 28th, when the Budget will be presented.

### Medical Committee.

The meeting of the Medical Committee of the House of Commons, on March 24th, was attended by all medical members of Parliament save one. On a circular letter, which had been sent to all members of Parliament, the Committee discussed the claims for a legal qualification for osteopaths. Mr. T. Sinclair (Belfast) cited an unofficial statement from the General Medical Council, pointing out that the present medical qualification was laid down by Act of Parliament. The general opinion of the Medical Committee was that the views expressed in this statement should be made public. The Births and Deaths Registration Bill was again considered, and Dr. Fremantle arranged formally to move its first reading. Dr. Haden Guest brought forward a Bastardy Bill, prepared by the "Six Points Group" of women politicians, but the Committee decided that it could not support this bill in its present form.

### Public Health Bill.

The Public Health Bill, a private member's measure to authorize the adoption by local authorities of health and miscellaneous powers already conferred on many municipalities by local Acts, was read a second time by the House of Commons on March 20th, without a division. In moving the second reading Mr. Womersley pointed out that eighteen years had elapsed since Parliament last passed an Act embodying public health provisions based on local Acts. Dr. Fremantle commended the proposal in the bill that in premises where the body of a person dead from infectious disease was lying, the person in charge of the premises must take reasonable steps to protect those who might come in contact with the body. He pointed out that the bill defined "dangerous infectious disease" as meaning only infectious diseases which were named in Section 6 of the Public Health Act, 1889. Many unpleasant and dangerous diseases had been discovered since 1889. However, another section of the same clause in the present bill authorized the Minister of Health by Order to declare any other infectious disease to be dangerous, temporarily or permanently, in one particular area, or generally; this would apply to diseases not named in the Act of 1889. It would, for example, include cerebro-spinal meningitis and tuberculosis. The bill was an essential preliminary to the consolidation of the public health law of the country, which all interested in the public health desired to see. At present it was almost impossible for anyone who had not made a special study of public health law and administration to find his way through the enactments of the last fifty years. He asked for a promise from the Ministry of a consolidating Public Health Bill within the next year or two.

The Parliamentary Secretary of the Ministry of Health, Sir Kingsley Wood, said the Government believed it was time the Public Health Acts were brought up to date and consolidated. The Ministry welcomed this bill, and would be glad to give it such facilities as might be needed to help it speedily to become law. The Ministry thought it necessary that a further bill should be introduced making a number of amendments in the Acts which experience had shown to be required. The preparation of this Government bill was well advanced, but as two Public Health Bills could not well be dealt with in one session,

and as the Association of Municipal Corporations was anxious to promote the bill which was that day before the House, the Government had decided to defer its bill to 1926. It would be followed still later by a Consolidation Bill. Dr. Fremantle had called attention to the power which the present bill gave to the Ministry of Health to include other dangerous diseases. That was a very general power, and if it were exercised notification would follow, but the power was qualified by the word "dangerous." The Public Health Act did not include such dangerous infectious diseases as plague and dysentery.

Mr. Herbert Williams said they had seen in the present century one of the greatest miracles in the history of mankind—the cutting down of infantile mortality from something like 160 out of every 1,000 babies born to less than half that figure. This was the result of the public health work of local authorities under the powers conferred upon them by Parliament. The new powers conferred on all municipalities by this bill, such as the power to deal with verminous houses, would lead to a further advance. He asked whether the powers which the bill gave local authorities for dealing with watercourses would enable them to deal with the breeding places of flies and mosquitos.

The bill was read a second time without a division, and sent to a Grand Committee.

### Indian Medical Service.

General Sir Richard Luce asked the Under Secretary of State for India, on March 23rd, the present strength of officers in the Indian Medical Service; how many of these were of European birth; how many recruits, European and Indian respectively, had been obtained for permanent service during the past twelve months, and how many for short service.

Earl Winterton replied that the present figures, so far as he could ascertain them, were 532 British and 142 Indian permanent officers, together with 148 Indian temporary officers. In the last twelve months 14 British officers had been appointed to permanent commissions, with the option of retiring with gratuities after five years' service. He was not aware how many Indians had been appointed to temporary commissions during the last six months. A number of Indians, not exceeding ten, had been or were about to be appointed to permanent commissions.

### R.A.M.C. Pensions.

General Sir Richard Luce, on March 24th, asked the Secretary for War if he was aware that an officer in the Royal Army Medical Corps had recently retired, after twenty years' service, with a pension of £328 per annum, and that this sum was £37 below the sum he understood he would receive after twenty years' service, when he joined the corps; and whether the Minister would take steps to secure that no officer who joined the corps before the warrant of 1919 came into force would in future be retired on a lower pension than he would have received under conditions existing when he joined the corps. Sir L. Worthington-Evans replied that the facts stated in the question resulted from the joint effect in this individual case of the rule that service on the West Coast of Africa counted double towards the twenty years required for voluntary retirement, and of the introduction in 1919 of a rank element into the calculation of retired pay.

General Sir Richard Luce, on the same date, also asked the Secretary for War whether a major, Royal Army Medical Corps, retiring after twenty years' service only received an increase by the 1919 warrant of £31 to his previous pension of £365, and that, by the reduction of 5½ per cent. on the increased pension of £396, he had had the increase reduced, not by 27½ per cent., but by nearly 67 per cent.; and if he would take steps to secure that these officers did not in future have their pensions reduced by a larger amount than 27½ per cent. of the increase granted in 1919. The Minister replied that the question was based on a misapprehension. The revision due to the fall in the cost of living which was made from July 1st last applied to the 1919 rate of pay itself, and not to the difference between the rates under the 1914 and 1919 warrants. A reduction of 5½ per cent. was therefore applied correctly to the 1919 warrant rate of £396 per annum in the instance quoted. A full explanation of the process had appeared in the press last December.

In a supplementary question, Dr. Fremantle asked whether the Minister realized that these and similar cases were responsible for the failure to recruit for the Army Medical Service. The Secretary for War said that a printed statement had been circulated to remove such apprehensions. Dr. Fremantle remarked that it was not a misapprehension, but a fact, that the Secretary for War was sailing close to the wind. The Speaker said that was a matter for argument.

### Pensions.

Appeals.—Answering Colonel Acland-Troyte, on March 24th, Colonel Stanley, for the Minister of Pensions, said that in 8,000 cases appeals had been made against final awards of 20 per cent. and over, and in 104,000 cases against final awards of less than 20 per cent. In the former group of cases 35.1 per cent. of final awards were increased and 1.8 per cent. were reduced, and in 24.5 per cent. of the cases the tribunal decided that the case was not suitable for final award. Of awards of less than 20 per cent.,

4.8 per cent. were raised to pension rate, 23.2 per cent. slightly increased, and 0.1 per cent. lowered. The tribunal decided that 25.4 per cent. were not yet suitable for final award. Colonel Stanley could not agree that the compensation provided for cases of less than 20 per cent. was in principle unsatisfactory.

During the debate on the report stage of the Army Estimates, on March 23rd, the Secretary for War said he could not agree that the army medical sheets of ex-service men should be divulged save to the man's own medical adviser. The practice was to communicate it to the man's own medical adviser if the man chose to authorize the War Office to do this. He could not agree to give the sheet to a non-professional man, otherwise the man's own interests would suffer. Medical men must have assurance that these reports were confidential. If the medical officer of a trade union were acting for the man he could have the sheet.

**Insurance Statistics.**—The Minister of Health stated, in reply to a question on March 17th, that in 1923 the insured persons in England and Wales numbered 8,992,100 men and 4,325,800 women. Sickness and disablement benefits amounting to £7,671,500 were paid to the men, and similar benefits amounting to £5,855,900 to the women, making £11,533,400 in all. Statistics were not compiled to show the number of cases assisted in a year, or the total number of weeks of sickness. In 1914 £4,140,000 was paid under the National Health Insurance Act to doctors for medical service, £1,051,000 for medical supplies (medicines, etc.), and £1,077,000 for maternity benefit. In 1923 the payments were: medical service £6,681,000, medical supplies £1,509,000, maternity benefit £1,526,000.

**Insurance.**—Mr. Read, on March 19th, suggested that persons who under the present arrangements are not entitled, after a period of residence abroad for more than one year, to claim any sick benefit until the intervening contributions have been paid, or a further 104 contributions paid, might be allowed the benefit of the contributions made by them to the time of leaving the country. Mr. Neville Chamberlain saw great difficulty in this suggestion, but promised to send it to the Royal Commission on National Health Insurance for consideration. Provisional regulations, dated March 19th, 1925, made by the National Health Insurance Joint Committee, entitled the National Health Insurance Approved Societies' Amendment Regulations, 1925, have been laid on the table of the House of Commons.

**Poor Law Relief.**—Mr. Neville Chamberlain stated, on March 19th, that the Government does not intend to bring in legislation this session to amend the law of Poor Law relief. The total expenditure for relief of the poor and for associated purposes in England and Wales during 1924 was £38,000,000, being a reduction of £3,934,000 from 1923. Of the 1924 total, £1,185,000 was for administrative charges.

**The Dismissal of a Medical Officer.**—Major Hore-Belisha asked the Minister of Health, on March 18th, whether his department had received from the Plymouth Town Council a report of the proceedings culminating in the dismissal of Dr. Bushnell; whether he had approved this dismissal; and if so, whether he would give the doctor an opportunity of having the charges against him specified in order that he might refute them. Sir Kingsley Wood replied that the Minister had not received such a report. The Minister was not required to approve the determination by the town council of its contract with Dr. Bushnell, and the question of giving him an opportunity of having the charges specified did not therefore arise. It was not the fact that before a borough council could appoint a medical officer it had to obtain the approval of the Ministry of Health. Major Hore-Belisha asked whether it was not a grave injustice that a medical man could be dismissed without any proper charge being made against him and without his having the opportunity of answering any complaints. Sir Kingsley Wood answered that on the question of injustice he could give no opinion.

**Chemical Warfare.**—Answering Mr. Ammon, on March 20th, Sir L. Worthington-Evans, Secretary for War, said that in addition to 22 naval, military, and Air Force officers, and 26 civilian scientists, 82 soldiers and 92 civilians were employed at the Chemical Warfare Establishment, Porton, on research and experiment relating to defence against gas and the treatment of gas casualties. For protection against gas it was essential to investigate new gases and other forms of chemical warfare which might be used against this country. In 1924 the 1,001 live animals used for experimental purposes at Porton included 3 goats, 4 monkeys, 68 cats, 445 rabbits, 251 guinea-pigs, 166 rats, and 64 mice. Of these, 337 were killed as the result of the experiments, and the rest were destroyed; it was the rule to destroy animals after they had been used for this purpose.

**Deaths of Seamen.**—Answering Dr. Shiels, on March 19th, Sir Burton Chadwick, Parliamentary Secretary, Board of Trade, said that in the mercantile marine in 1922 the crude death rates per 10,000 from pneumonia were 2.4 among British seamen, 4.3 among 2.0 among British seamen, 1.3 among foreign seamen, and 5.6 in 1922 were: British seamen 18.4, foreign seamen 25.1, and 36.3, and from accidents and injuries: British 32.8, foreign 37.8, and 12.1, phthisis 6.2, other diseases 43.6, accidents and injuries 12.9.

**Foot-and-Mouth Disease.**—In replies to questions on March 23rd, the Minister of Agriculture, Mr. Wood, said that fifteen cases of foot-and-mouth disease had been confirmed since January 1st, and 1,212 animals had been slaughtered. It was not proposed to build a new experimental station to test Dr. John Shaw's remedy for foot-and-mouth disease. The premises at Pirbright to be used for the purpose were formerly used by the Ministry as a cattle testing station and were being adapted for use by the Scientific Committee on Foot-and-Mouth Disease. It was not legally possible for Dr. Shaw to carry out the test without a licence from the Home Secretary under the Cruelty to Animals Act, 1876, which the Minister was advised Dr. Shaw did not hold. But he would be invited to be present during experiments by officers of the Ministry's veterinary staff.

**Imported Medical Appliances.**—A statement issued by the Board of Trade as to the value of scientific instruments and appliances imported into the United Kingdom shows that in 1924 the value of dental, surgical, medical, and veterinary instruments, except optical, imported was £47,510; that of appliances, including trusses and artificial limbs, £17,089; and that of aseptic hospital furniture £16,357. In 1922 the respective values were £26,675, £9,514, and £9,674. The value of imported lenses, prisms, etc., including those imported with complete instruments, in 1924 was £224,886.

**Smoke Abatement.**—In answering questions, on March 19th, about smoke abatement, Mr. Neville Chamberlain said the estimate that 66 per cent. of the smoke pollution came from industrial chimneys was too high. He thought that the greatest contributor to smoke pollution was the domestic fire. He hoped to introduce a bill on the subject next session.

#### Notes in Brief.

In 1924 the estimated consumption of sugar in Great Britain and Northern Ireland was 2,549,000 cwt. refined and 42,618,000 cwt. unrefined; of tea, 3,510,287 cwt.; and of coffee 320,595 cwt. For meat the latest figures are for the year ended May, 1923, when 2,524,000 tons were consumed, including 954,000 home-grown. Figures of the home consumption of milk, bread, butter, and margarine are not available.

The Government does not contemplate legislation to enforce the provision of lavatories on railway trains.

Of 28,742 men rejected from the army at the primary medical examination last year, 1,743 were rejected for defective vision and 2,062 for defective teeth.

The War Office states that there is no medical objection to a battalion going under canvas for the month of April at Aldershot.

Satisfactory progress is being made in drafting the Government's Poor Law Reform Bill, which will be circulated for the opinions of local authorities.

Persons making a return for super-tax number, according to the latest statistics, 87,704.

The Home Secretary does not propose to proceed with the Factories Bill in the House of Commons for some weeks, and in the meantime will receive deputations from trades which would be affected by it. The text of the bill introduced last year by Mr. Arthur Henderson is not to be adopted as a whole by the Government.

## Correspondence.

### VERONAL POISONING.

SIR,—As surmised in an annotation in the BRITISH MEDICAL JOURNAL of March 21st (p. 570), it is likely that death from veronal poisoning is more common than statistics indicate. May I suggest a probable cause for the mortality, and a possible remedy? We have four salient facts—at least, judging from my own experience, they seem facts to me. (1) The drug is so potent that, given properly and in ordinary insomnia, it is rarely necessary to prescribe more than 5 grains, and usually 2½ grains is sufficient. (2) There is no clear evidence of habituation; its victims merely desire drowsiness, not other sensations as well (as in the case of alcohol, opium, and cocaine); given natural sleep it is not desired; no more, and no less, than procures sleep is desired; as time passes there is no augmented craving, and the same dose continues to produce the same effect. (3) The action is delayed—four, five, or six hours. (4) Apart from deliberate suicide, in every case of death the victim has tried to procure immediate sleep.

The case of a London clubman is instructive and typical. During an attack of insomnia he took 10 grains at bedtime, which in his case was late. He was wakeful that night, but "deadly drowsy" next day, a circumstance which he attributed to lack of sleep. The following night he took 15 grains. Again he was wakeful; but in the afternoon slumbered so profoundly at his club that the attendants had difficulty in rousing him. Manifestly heavy and stupid,

he went home, and subsequently had difficulty in clearing himself from a charge of drunkenness before the club committee. "Veronal is no good; it has not the smallest effect on me," he declared. On a later occasion, when ignorant of the remedy applied, he was given 5 grains in the early evening. He described himself as getting "a heavenly night," but as being too sleepy in the morning. Thereupon he was given 2½ grains, also in the morning. Now he had "perfectly natural sleep" with no apparent drowsiness till he went to bed, and none after he rose. He was then told the facts and informed that the fit of insomnia was probably broken, which proved to be the case. He still takes veronal, but rarely, and never in more than 2½-grain doses; I could quote many similar instances. But doubtless individuals vary.

It seems evident that, apart from deliberate suicide, excessive doses are taken only because the victim, ignorant of the delayed action, makes more and more strenuous efforts to procure immediate sleep. I suggest that patients shall always be informed of the delay, and that a label shall be affixed to every packet affirming the uselessness of veronal as a quick remedy for wakefulness.—I am, etc.,  
Southsea, March 23rd.  
G. ARCHDALL REID.

### THE IMMEDIATE AND REMOTE EFFECTS OF SUNLIGHT ON THE EPIDERMIS.

Sir,—Although the matter in this letter may be considered by some to be more academic than practical, yet it raises some points of great interest. Here are my facts. I have recently microscopically examined skin that had been "bronzed" by therapeutical exposure to sunlight. There was very marked mitosis occurring in the epithelial cells situated above the basal layer. Dr. Arthur Whitfield has examined skin after I had applied to it, preparatory to operation, a solution of 1 in 20 carbolic acid, and he found the same mitotic changes. Ten years before any particular reference had been made to the matter, I published in the *BRITISH MEDICAL JOURNAL* (June 12th, 1909) coloured plates reproducing the backs of the hands of an old countrywoman. The plates show that the skin covering the backs of the second metacarpals had undergone atrophy, pigmentation, loss of pigment, and had lost its elasticity. Although I attributed the state of the skin to "biotripsis," or life wear, there can be no doubt that it was due mainly to the sunlight factor of life wear. I stated also that precisely the same changes exist on the same parts of the hands in white people who have spent their lives in tropical countries; that this situation of this particular kind of biotripsis is the commonest site for squamous epithelioma to begin on the hands; and that gardeners very frequently are subjects for squamous epithelioma on this part of the hands. Dr. G. M. Findlay, at the Pathological Section of the Royal Society of Medicine (February 17th, 1925), showed that artificial ultra-violet rays hasten the advent of carcinoma on the skin of mice that has been painted by tar. Also that once tar carcinoma has been induced, its growth is stimulated by the application of ultra-violet rays. These facts seem to me to necessitate care and judgement in the application of sunlight and ultra-violet rays to parts already suffering from results of at least this form of irritation. I am more impressed by the necessity of care in the application of ultra-violet rays by recently having seen a lesion that had been exposed to ultra-violet rays as a speculative therapeutical procedure. The lesion was getting worse in a very remarkable manner.—I am, etc.,  
London, W.1, March 23rd.  
G. LENTHAL CHEATLE.

### THE LIBERTIES OF THE PROFESSION.

Sir,—I trust that the astounding action of the Ministry of Health in disregarding the verdict of the impartial tribunal appointed by itself, and in imposing a penalty on one of our fellow practitioners declared by that tribunal to be innocent of the offence charged against him, will not be met by us with our usual indifference. If we stand this we shall stand anything. We have been subjected to an affront and an injustice which no body of organized workmen in the country would tolerate for a minute. Quite

apart from the disregard of the considered verdict of the tribunal, it is nothing short of an outrage that the officials of a Government department should be able with impunity to impose financial penalties for what even they can only describe as an error of judgement. Surely it is the General Medical Council, through its regulation of qualifying examinations, that alone is entitled to determine what shall be the measure of ability and knowledge entitling a man to practise medicine in this country. Negligence and malpractice are another matter, and may rightly be confronted with the penalties of the lay authorities; but in this case there was no question of negligence or of malpractice. It is obvious to me, and, I should imagine, to almost every medical man, that we are here faced with a direct and singularly provocative attack on our fundamental liberties. I sincerely trust that preparations are in hand for an organized and effective protest.—I am, etc.,  
London, E.1, March 22nd.  
HARRY ROBERTS.

\* \* The Ministry of Health has not responded to the invitation extended in the annotation published in the *JOURNAL* last week (p. 566) to send us any explanations it might wish to offer of its action in the case reported in the *SUPPLEMENT* last week (p. 122). The subject was brought to the notice of the Council of the British Medical Association at its meeting this week, but too late for us to publish a report of its decision. We understand, however, that the Royal Commission now sitting will be asked to consider the position. In an interview published in the *Times* last week (March 19th), Dr. Cox, Medical Secretary of the Association, said that the matter was important and that the Association intended to take it up with the Ministry. He added that though, on the whole, the profession was satisfied with the judicial machinery of the insurance scheme, there had been some cases in which the penalties were unnecessarily severe, and one or two in which, although the Committee of Inquiry had recommended that there should not be a penalty, the Minister had imposed one.

### CAUSATION OF CANCER.

Sir,—In your issue of March 7th (p. 483) Dr. Ern Nève, in referring to "kangri-burn cancer," upon which he is such a high authority, suggests that it affords convincing proof of the "irritation" theory of cancer, and adduces the irritation of blocked ducts and acini as an alleged factor in the production of cancer of the breast, and further support of this theory. I am not familiar with these conditions in the breast as precursors of cancer, nor indeed do I attach much importance anywhere to mechanical irritation in the etiology of malignant disease, for there are many obvious examples of the most persistent and prolonged mechanical irritation of which never induce cancer; as, for instance, the pressure of artificial limbs, trusses, spectacles, boots, crutches, and

But everyone must have been impressed by the recent work on the experimental production of cancer by chemical agents—tar, soot, oil, etc.—and I wonder whether Dr. Nève has considered the possibility of a chemical origin for kangri-burn cancer. This disease furnishes an exceptionally well defined silhouette in the natural history of cancer; indeed, so definite are the conditions of its production and so constant the results that it is almost equivalent to an experimental laboratory cancer, and yet at first sight how different is the agent that produces it! Is it not possible that the constant baking to which the tissues are subjected results in the production of some chemical agent comparable in its effects with the soot, tar, oil, etc., now so firmly established as the causes of their specific cancers?

I do not suggest for a moment that the problematical agent produced by heating the tissues is the cause of "kangri cancer," because I do not believe that any of the substances so brilliantly investigated by Leitch and others is the immediate sole cause of the kind of cancer with which it is associated; but they certainly do act as exciters of cancer, and no doubt they pull the trigger, possibly by playing much the same part as the catalyst which is so all-important in many chemical processes.—I am, etc.,  
London, W.1, March 16th.  
CECIL ROWNTREE.

## THE CORONER'S COURT.

SIR,—I presume the coroner's court is an institution in which the medical profession takes an interest. It is one of the oldest institutions in this country. It existed long before police and modern police magistrates, and had in its earlier days a very definite function in criminal administration. In present-day criminal administration it has no proper place. For to-day the initiative is with the police; when it has finished the police court must go over the same ground and bring its verdict entirely independent of the coroner's court verdict. The coroner's court may convict or acquit, but the magistrates' court is in no way bound by that verdict. Hence it has no place—is supernumerary—in the organization for criminal investigation. It thus serves no purpose at present. It costs the taxpayer a considerable amount. It causes considerable inconvenience unnecessarily to all concerned, and should be abolished. I think the police department would even go so far as to say that it often causes them to "show their hand" prematurely, to the disadvantage of criminal investigation.

There is no need felt for a coroner's court in countries where it does not exist. In such countries, when the police have reason to suspect foul play they call on a medical officer to make a *post-mortem* examination, the body being recognized by one or more persons in the presence of that officer, and such identification entered in the record. If poison is suspected, the necessary parts are sealed up by him and sent to the chemical-toxicological examiner to the government. The report, or a copy of it, is made over to the police, who in due course bring the case before the magistrates' court, who dispose of it, as our magistrates now do. By this procedure the police have not to "show their hand" prematurely, which is often a great advantage over the coroner's court proceedings. It serves all the ends of criminal administration without duplication or unnecessary inconvenience to any of the parties concerned. The coroner's court could be scrapped without loss and with the saving of the large amount of the taxpayers' money which it now costs.—I am, etc.,

HENRY SMITH, C.I.E.,  
Lieut.-Colonel I.M.S.

Sidcup, Feb. 23rd.

\*\* A note upon the bill the Home Secretary, at the end of last year, promised to introduce will be found at page 619.

## TREATMENT OF DIABETES BY RAW FRESH GLAND (PANCREAS).

SIR,—I was very interested in Dr. Hollins's article in the *BRITISH MEDICAL JOURNAL* of March 21st (p. 503), and can fully endorse his statements. Exactly thirty years ago (1895) I became interested in this subject, and wrote a thesis on it for the degree of M.D. Glasg. entitled "The pancreatic treatment of diabetes mellitus" by the raw fresh gland, in which I stated the results of some half-dozen cases. The success which in those early days attended the administration of thyroid gland in myxoedema suggested the trial of pancreas gland in diabetes, and, strange to relate, my method of administration was exactly identical with that adopted by Dr. Hollins, even to the mincing of the gland and mixing it with lettuce. I prescribed half a gland of sheep's pancreas daily without any untoward symptom arising, or any disinclination to take it on the part of the patient.

From the beginning I was very gratified with the rapidity with which the sugar disappeared from the urine as well as the diminution of thirst and polyuria. In addition, there was an increase in weight and a general feeling of well-being as long as the treatment was continued regularly, but a tendency to relapse on its cessation. Neither did I find it necessary to enforce too strict a diabetic diet in my cases, nor to prescribe for a time absolute rest. I have had no occasion to use insulin.

In conclusion, I would suggest a trial in the fresh raw state of any of the endocrine glands in disease in preference to the compressed form.—I am, etc.,

London, March 26th.

R. ROBERTSON YOUNG, M.D.

## MASSIVE PULMONARY COLLAPSE.

SIR,—In his paper on "Massive pulmonary collapse," published in the *BRITISH MEDICAL JOURNAL* of March 21st (p. 544), Dr. Bertram Soltau refers to instances of tachypnoea following encephalitis lethargica, and inquires whether observation has been made in such cases as to the condition of the diaphragm.

There are several references in the literature upon this point: Laignel-Lavastine and Maingot have recorded an asynchrony between the two halves of the diaphragm during respiration. Vincent and Bernard (*Bull. et Mém. Soc. des Hép. de Paris*, 1922, 46, 1111 and 1181) have drawn attention to a fixity of the lower half of the chest in the position of full inspiration, with an associated immobility of the diaphragm, which they attribute either to paralysis or a state of spasm.

In a paper in the forthcoming number of *Brain* we have reviewed the whole subject of respiratory disorders occurring in epidemic encephalitis, at the same time reporting six fresh cases. In two of these, radioscopic examination of the diaphragm reveals some slight abnormality taking the form of a jerky or broken character to the expiratory component. This was reflected in the breathing as a cog-wheel expiratory effort. In a third case a similar type of respiration was encountered, but here no confirmatory x-ray examination was made.—We are, etc.,

W. ALDRIN TURNER.  
MACDONALD CRITCHLEY.

National Hospital for the Paralyzed  
and Epileptic, W.C., March 23rd.

## THE TREATMENT OF PNEUMOCOCCAL EMPYEMA.

SIR,—I have read with much interest Professor G. E. Gask's article on exploratory thoracotomy (*BRITISH MEDICAL JOURNAL*, February 21st, p. 343), and with great pleasure your leading article on chest surgery, especially in its reference to the treatment of empyema and its dissatisfaction with the old and well tried method of incision and drainage. But in discussing this subject we must distinguish between the treatment of a pure pneumococcal infection, that of a mixed infection, and that of a pure staphylococcal or streptococcal infection. Drainage must always be carried out, in one form or another, in any case that is not purely pneumococcal. I will therefore confine my remarks to cases of pure pneumococcal infection following pneumonia, and these are the cases we most commonly have to deal with.

As I have stated elsewhere (*BRITISH MEDICAL JOURNAL*, 1920 and 1923), in pneumococcal empyemata the mere evacuation of pus out of the pleural cavity is not the sole aim of treatment; far more important is the restoration of function of the compressed and collapsed lung. We have to deal with a rigid thorax—a collapsed lung, often in old-standing cases covered on its visceral pleura with plastic lymph, and frequently adhesions to the parietal pleura—as well as a cavity full of pus and fibrinous masses of lymph. Therefore our aim must be to get the lung into as favourable a condition as possible to promote re-expansion. In securing this ideal there are two fundamental principles:

1. To make a sufficiently large opening into the pleural cavity, not only to palpate, but also to inspect the lung. The opening must be large enough to allow the whole hand to enter the pleural cavity in order to clear out all fibrinous clots, to separate adhesions (if feasible), and to free the lung from all plastic lymph; and also, if necessary, in old-standing cases, to decorticate the lung. Having thus promoted re-expansion of the lung, the pleural cavity should be well irrigated with an antiseptic fluid. I now use 1 in 40,000 mercuric perchloride solution, because the pneumococcus is killed by 1 in 20,000 solution in two hours (*Choyce's Surgery*, vol. 1, p. 68). I have never had any danger arise, either from free washing out of the pleural cavity or from use of this mercurial solution, some of which is left in the pleural cavity.

2. To use some method which abolishes a "sucking wound." The atmospheric pressure is greater than intralobar or intralobular pressure; therefore an open sucking wound must hinder the re-expansion of the lung. Many procedures have been advocated. The drainage of the

pleural cavity into an antiseptic fluid is commonly practised, and a most ingenious method is that of Otto Pickhart (*Archives of Surgery*, January, 1924). There are also the various methods of negative pressure, such as the Morelli method of replacement of pus by air.

I still adhere to the method of immediate closure followed by daily evacuation of the pleural contents with an exploring syringe. I have had some cases in which healing took place by first intention, but I have also had failures. These have been cases with much adhesion of lung to diaphragm or parietal pleura, in which I could not, without severe hæmorrhage, free the lung as fully as I wished. If this method does not succeed no harm is done, because, if the daily count of organisms does not rapidly fall, or if fluid reaccumulates, it is easy to remove a few stitches and use some form of drainage.

The suction method of Poynton and Reynolds is very serviceable in infants who cannot stand rib resection, but as it does not allow of evacuation of fibrinous masses it is often a failure, and an open operation has sometimes to be performed subsequently.

No matter what method of treatment is adopted we all have failures. Cases refuse to heal, and a permanent sinus is left. These cases are due to adhesions not allowing the lung to re-expand. How are we to deal with these cases? Estlander's operation is a mutilating procedure, and can be superseded by Emil G. Beck's open method of intrathoracic surgery (*Archives of Surgery*, January, 1924). This is a skin sliding operation—that is, the taking of skin flaps from the chest wall and fixing them into the cavity and making the cavity outside the body.

My procedure now is that if a persistent sinus is left I inject into it bismuth solution and x-ray the chest. If the cavity is small, I resect a rib over the cavity, pack it, and allow it to heal by granulation. If, however, the cavity is large, I lay it freely open by resection of the ribs overlying, cleanse the cavity, take skin flaps from the chest wall and slide them into the cavity, and fix them there by sutures. The cavity very soon heals, becomes skin-lined, and is easily kept clean. Although the lung which is collapsed never freely re-expands, the other lung takes up its function and the sinus is cured.—I am, etc.,

Windsor, February 23rd.

FRANK J. HATHAWAY.

#### RECENT ADVANCES IN THE STUDY OF CARDIO-VASCULAR DISEASE.

SIR.—The lecture by Professor MacIlwaine of Belfast, published in the *JOURNAL* on February 7th (p. 249), leads me to remark that advances in the study of cardio-vascular disease have indeed been prominent during the last quarter of a century, if we are justified in so describing all the newer methods of investigation and their results which have made their appearance within this period. So extensive have been these departures that they have necessitated a new nomenclature to cover and label the results; incidentally, this unfamiliar terminology has served to mark the gulf which separates the cardiology of the past from that of the present. But whilst advances inevitably imply changes, changes do not always signify advances. It is with this doubt in mind that I have ventured to italicize the word "advances," for advance means change for the better.

Up to the early years of this century cardiology had gone on very quietly; some will think too quietly, and that it had become a trifle stagnant. Sir James Mackenzie thought so, and, to his honour, had been observing, recording, and pondering for many years in search of new lines of approach towards the solution of problems admittedly very complex. In 1908 his first edition of *Diseases of the Heart* was published and at once made its mark; this event is justly described by Dr. MacIlwaine as follows: "Then came the epoch of Mackenzie's work, which dominated all clinical pathology"—it did; there was thenceforth an end to complacency and contentment with past achievement. The basis of Mackenzie's work was the study of the individual cardiac cycle, and the new line of approach was by way of the systemic veins and their pulsations at the root of the neck; the instrument for recording these pulsations was the polygraph, which simultaneously gave records of the

arterial pulse. The featuro then in this new departure was the investigation of the tracings so obtained. I would quote a notable passage from the preface to the first edition of *Diseases of the Heart*; Mackenzie says:

"The interpretation of these records may prove to be faulty, and an endeavour has therefore been made to keep the actual observation separate from the interpretation, so that, if the latter be erroneous, the recorded movements may at least remain available for future workers in this field."

Here speaks the true spirit of the scientific explorer, for it shows that the author was fully alive to the dangers which attend upon all instrumental investigation. The italics of the word "interpretation" are mine.

In my opinion there has been too little thought and criticism bestowed, both upon the instrument and the interpretation of its records. I have endeavoured to set forth the argument in full in a chapter of *The Heart as a Power-Chamber*, 1922, also in two supplementary papers in the *BRITISH MEDICAL JOURNAL* of April 14th, 1923, and of November 8th, 1924, respectively; the following are some selected salient points:

1. In respect of the adequacy of the instrument itself this primary objection arises—namely, that it has no access to the left heart, the pulsations which it records being of those veins only which are tributary to the right auricle; whereas the pulsations occurring in the veins feeding the left auricle are buried in the depths of the lungs and never come near the surface of the body. But the left heart is not only the site of the most powerful cardiac activities; it is also the preponderating site of the incidence of disease, neither of which, therefore, can in their effects appear in the polygraphic tracing. Thus in the case of mitral stenosis, with marked auricular hypertrophy, proceeding in the course of things to auricular asystole (fibrillation), the tracing can show neither the marked accentuation of the a wave (accepting the theory of its production), nor the disappearance of the accentuated wave when asystole sets in.

2. In respect of the delicacy of the instrument and its fitness to transcribe faithfully the venous undulations, the instrumental error, introduced by the inertia of the lever-pen and multiplied, as it must be, by the inertia of the liquid waves—that is, their tendency to persist and interfere more or less with antecedent and succeeding waves—raises the question of the faithfulness of the transcript as a record of the events causing the undulations. In respect of the analysis of the waves, it is suggested that an instrument working at greater speed would be advantageous by spacing out the individual waves.

3. In respect of the interpretation of the different waves in terms of their mode of production, so as to justify the nomenclature adopted, let us first consider the a wave, so called, and note that the effect of the sphincter action at the mouths of the cavæ, which the circular muscular fibres there placed must exert (seeing that these fibres are part and parcel of the auricular musculature), has been wholly ignored; yet it must interfere more or less with the backward propagation of an auriculo-systolic wave, perhaps even to its complete cancelling. On anatomical and physiological grounds alike this neglect is unjustifiable.

4. Let us next take the v wave, the termination of which has been described as marking "one of the most certain periods in the cardiac cycle." This is the wave which has been styled a wave of stasis because its ascent is determined by the pressure rise in the auricle under the *vis a tergo* in the veins as the blood accumulates behind the closed auriculo-ventricular valve during the entire period of the ventricular systole—that is, three-tenths of a second. Now comes the ventricular diastole, which releases the auriculo-ventricular valve, and this, which is a sudden event, is held to be responsible for the abrupt descent of the pressure line. This theory brings in two factors as productive of the v wave, the one gradual, the other sudden; but, if this be the case, the line of ascent must be gradual and the descent sudden. Is this the character of the v wave of the tracings? No; the v wave is, in type, just like the other waves. Further, physiology contradicts this mode of genesis by showing that in typical intracardiac pressure curves there is commonly no appreciable pressure fall at the end of ventricular systole.

Space forbids the further pursuit of this subject, but it

is hoped that sufficient has been said to justify the appeal which I would make to my colleagues in general, but especially to those that teach and those that are engaged in laying the foundations of their medical knowledge, that they should look into this, each for himself, with an open mind, and seriously, seeing that so much is involved.—I am, etc.,

London, W.1, Feb. 18th.

HARRINGTON SAINSBURY.

#### THE READING OF SKIAGRAMS.

SIR,—Most atlas-making for clinical comparison of the normal and abnormal must be largely futile unless the axial focal distance of the radiographic centre of emission from the plane of the plate, film, or screen be directed through the same anatomical points, and unless the distance be proportional to some well marked and constant dimension of the parts depicted, which parts (while of the same shape externally) may yet vary greatly in actual size.

Thus, in comparing a normal chest 30 inches in circumference with a suspected one 45 inches in circumference—provided always there is no gross deformity of the bony thorax to be felt externally—the normal distance of the centre of emission might be in such cases three or four times the antero-posterior thickness of the smaller and larger chest respectively, at the same level of the chest in the middle line. Otherwise we might get a dissimilarity of the outlines of the internal organs not due to real anatomical disproportion of the organs, but entirely due to dissimilarity or "distortion" of the perspective employed.

Again, as is done systematically with all lantern slides for his guidance before handing them to the lantern operator (and especially in these latter days of double-coated films), all x-ray plates and films should be automatically "spotted" by the x rays themselves at the time of exposure, so that subsequent observers may all know which side of the film, direct or reverse, they are looking at. After all, the shadow on the window blind viewed from the street is not a view through the window pane into the locked room! What is wanted is a glimpse through the keyhole.

According to the rules of ordinary perspective, what may be called the fluorescent screen side of the x-ray picture plane is the false or reverse side thereof, and dependence on the screen finding alone must lead to all sorts of false visual judgements as to direction, position, and size of the hidden parts depicted. In systematic clinical radiography of large parts of the body, except perhaps in such a recognizable monomontary condition as of gas bubbling to the horizontal surface of the fluid in a wounded thorax, it is safest in most cases to regard the fluorescent screen as a large but reverse erect view-finder.

I hope to demonstrate lantern slides of these and other perspective considerations at the forthcoming International Congress of Radiology, which may perhaps take quite an intelligent interest in the application of perspective principles to x-ray interpretation.—I am, etc.,

W. COTTON, M.D.,

Late Captain R.A.M.C.(T.F.) in charge X Rays,  
No. 20 General Hospital, B.E.F.

Bristol, March 19th.

#### THE TREATMENT OF INFANTILE PARALYSIS.

SIR,—Mr. Hey Groves's address (*JOURNAL*, March 14th, p. 482) invites critical comment by its definite statements and by the vigour of its arguments. He makes two very strong pleas for special consideration in the treatment of this disease—first, the need for careful, painstaking, and prolonged management of the early stages, and secondly, the consequent necessity for more hospital accommodation. These are without question the two most important problems in the treatment of this exceptionally difficult disease waiting to be solved at the present time.

My personal criticism of the address concerns, first, a comparatively minor point regarding rest for the arms in the early stages; and secondly, the important question of due recognition being given to the pioneer of modern methods of treatment in the early stages.

Mr. Groves states: "The arms must be abducted at the shoulders, the forearms pronated, and the elbows flexed."

My experience has been that the tendency to pronation of the forearm is one which has often to be resisted. My practice is to rest the arm on a MacKenzie abduction arm splint, with the forearm and hand supported in a midway position between pronation and supination.

In his account of treatment in the early stages Mr. Hey Groves quotes only one authority for his description of the recommended treatment at this most important period—the late Professor Lovett of Boston (America). He makes the definite statement that "The one potent active remedial agent is muscle re-education." With this statement I am in complete agreement. But why does he not give credit for the introduction of this remedial measure where credit is due? Why is it necessary to quote Lovett as an authority on muscle re-education in this disease, and to refer also to the minimum load for a muscle or muscular movement as if it were part of Lovett's teaching? So far as I am aware, Lovett never mentioned the phrase "muscle re-education" in any of his published writings on infantile paralysis, nor did he ever make any reference to the term "minimal load."

More than ten years ago—to be exact, on January 9th, 1915—Dr. William MacKenzie published an article in the *BRITISH MEDICAL JOURNAL* on the "Treatment of infantile paralysis: a study in biology," giving a full and detailed account of his methods of re-education of the "paralysed" muscle.

The term "minimal load" for the work of a muscle was first used, I think, by Professor Sir Arthur Keith in a lecture at the Royal College of Surgeons in 1917 on the orthopaedic principles of John Hunter. In this he referred to the practical application in treatment by his friend Dr. MacKenzie of many of Hunter's facts. Why, therefore, should Mr. Hey Groves give the credit for the introduction of a specialized form of treatment to an American author when a much more substantial claim can be made out for one of British birth, whose contributions on the subject are available in the same medical journal as that in which publication is proposed?

In *The Principles and Practice of Medicine*, by Osler and McCrae (ninth edition, revised, published in New York and London, 1920), under the heading "Acute poliomyelitis—treatment," this particular article by MacKenzie in the *BRITISH MEDICAL JOURNAL* of 1915 is specifically mentioned, and is quoted from at length. No other name or method of treatment is mentioned. In justice to myself I may mention my own article in the *BRITISH MEDICAL JOURNAL* of October 2nd, 1920, on "The place of muscle re-education in the treatment of infantile paralysis," which has apparently also escaped notice.

In conclusion, I beg to state that I am in complete accord with Mr. Hey Groves when he says, "It is very doubtful whether massage or electrical treatment has any value"; also, if early treatment is successful, then, "when the extent and distribution of the paralysis have become fixed and definite, we ought to have no contraindications or deformities requiring correction."—I am, etc.,

London, W.1, March 16th.

CHARLES MACKAY.

#### NERVOUS EXHAUSTION AND LOW BLOOD PRESSURE.

SIR,—Physicians who possess special facilities for studying the phases and fluctuations of arterial pressure, as well as those who are more directly concerned with the psychoneuroses, are familiar with the fact that the majority of cases of "nervous exhaustion" exhibit low arterial pressures, and can thus substantiate the independent observation of Dr. D. W. Samways (March 7th, p. 482).

Owing to incomplete knowledge of etiology, in the past the term "neurasthenia" has been loosely used as a dumping-ground for many functional nervous derangements. For the present it would seem better to regard neurasthenia as the expression of states of nervous exhaustion of constitutional or acquired origin. The height of the arterial pressure affords a useful means of differential diagnosis between neurasthenia, in which the pressure is uniformly low, conversion hysterics, in which the arterial pressure is usually normal, and anxiety states, in which the pressure is often considerably raised.

In respect of treatment, my experience is that constitutional neurasthenia admits only of alleviation, and that the arterial and pulse pressures are almost or entirely unchanged. The acquired form is induced by certain toxæmias, either primary—of which the intestine constitutes the chief source—or secondary to acute infections or endocrine deficiencies. From the biochemical standpoint such are frequently correlated with diminution in calcium metabolism. Improvement under treatment is usually found to go hand in hand with a return to standard sphygmomanometric readings. Notable lowering of systolic, diastolic, and pulse pressures in the majority of cases coincides with distinct mental depression.

Chronic and profound prostration leads to depletion of pressor substances, and probably many forms of hypoplasia are due to the formation of fatigue products in muscle and gland tissues. It is certain that adrenal inadequacy forms a definite factor in cases in which somasthenia and profound prostration constitute the dominant clinical features of neurasthenia.

It is, perhaps, not yet sufficiently realized that true hypofunction of the adrenals may occur, apart from organic disease of these glands, in response to excessive and prolonged mental and physical strain. In some women, especially at the climacteric, there is undue lability of the autonomic nervous system, mainly affecting the vasomotor nerves, and to the adrenal hypofunction is added ovarian deficiency. In promoting recovery, administration of combined adrenal and ovarian extracts is helpful.

In the low arterial pressure which coexists with gastrointestinal atony the splanchnic area is involved, and such patients derive considerable benefit from a properly fitting abdominal belt and parathyroid medication. As regards adrenal hypofunction, apart from Addison's disease, atrophy is at times of service, whilst at other times a patient will be found in whom the exhibition of adrenal extract has no effect. Such subjects usually react well to strychnine.

In my view Dr. Samways is correct in attributing the lowered tone of the arteries, and consequently the reduction of arterial pressure, to exhaustion, which is induced, so far as our present knowledge extends, by the agencies which I have endeavoured to indicate. Further light on the problems of toxæmia in general and on the exact nature of the bodies absorbed from intestine and other foci is, however, greatly needed.

In estimating whether a given arterial pressure is low or not, Dr. Samways's single reading of "125 mm. Hg or less" is open to criticism in that it presents only a part of the whole circulatory picture. As I have pointed out during many years past in this *JOURNAL* and elsewhere, a single set of figures representing solely the systolic pressure, particularly when considered apart from age and body weight, both of which have important influences, is misleading, because it forms only a portion of "the complete arterial pressure picture," requisite for determination of the circulatory efficiency at the time of estimation. The complete picture is obtained by a simultaneous record of (1) systolic pressure, (2) diastolic pressure, (3) pulse pressure, (4) pulse rate, and (5) pulse pressure  $\times$  pulse rate product. Such figures take only a minute to enter in the case notes, and afford information of permanent value.—I am, etc.,

London, W.1, March 15th.

J. F. HALLS DALLY.

# RESPIRATORY ORTHOPAEDICS.

Sir,—Mr. F. Pearce Sturm has rendered a great service in drawing attention, in his letter (March 7th, p. 483) headed "Respiratory orthopaedics," to the necessity of following up all tonsil and adenoid cases in children by a course of respiratory exercises. The question is one that interests orthopaedic specialists very greatly. In an ordinary orthopaedic out-patient department they see a considerable number of children, who are brought by their parents (very often at the instance of a school medical officer), because they are round-shouldered, chronically tired, and flat-chested; in some cases there is early scoliosis as well. These children are invariably weedy, anaemic, and obviously

<sup>1</sup> BRITISH MEDICAL JOURNAL, October 11th, 1913.

debilitated, and in a majority of cases they are habitual mouth-breathers and show the typical open mouth, "adenoid facies," and other stigmata of that condition. In such cases, the obvious indication is to deal with the fundamental cause—namely, the respiratory obstruction; but it is not enough merely to send the patient to the throat specialist to have the tonsils and adenoids removed. Indeed, in some cases, this operation is unnecessary, and a course of respiratory exercises may cause the disappearance of the obstruction. It is the habit of mouth-breathing that needs correction, and the mere removal of the source of the obstruction is but an incident in the process. The operation itself is not curative. All that it does is to provide an airway through which the patient can breathe if he will. Usually he does not will, and a course of respiratory orthopaedics is necessary to teach him to do this, and the exercises must be continued until the habit of mouth-breathing has been completely corrected. Whether it is the business of the laryngologist or of the orthopaedist to prescribe these exercises is but a detail; the point is that they are indispensable, and should be employed in every case. I would even go so far as to say that in some cases the removal of tonsils and adenoids, without the after-treatment, not only does no good at all, but actually does harm.

When effective post-operative re-education is given, there is a very striking improvement in the child's general condition, though it may be difficult at times to effect much improvement in the actual form of the chest itself.

I venture to suggest that a very large number of the tonsil and adenoid operations now being performed upon children in such large numbers all over the country are rendered useless through failure to follow them up by appropriate respiratory exercises. I have long believed and taught, that it should be a routine in every clinic, and indeed in every case of tonsils and adenoids, to provide the necessary after-treatment after every operation; and if this led to an inconvenient crowding of the clinics, it would be far better to restrict the number of operations than to omit the after-treatment in any single case.—I am, etc.,

London, W.1, March 12th.

ALAN H. TODD.

# THE TREATMENT OF FIBROSITIS.

Sir,—As an interested listener to the recent discussion on fibrositis at the Royal Society of Medicine (reported in the *BRITISH MEDICAL JOURNAL* of March 14th, pp. 509-12), may I endeavour to co-ordinate the facts upon which it appeared to me the best opinion agreed, with a view to clarifying our ideas on treatment?

The dual causation of fibrositis—infective and metabolic—was well stated by Dr. Edgecombe. Dr. Alison Glover, on behalf of the Ministry of Health, marshalled an array of facts showing the incidence of the disease in its various forms in the two sexes and at different periods of life, and calling attention to the practical importance of strain or traumatism and of chill in the chain of causation.

Malassimilation, defective elimination, exudation or deposit in the fibrous tissues—"tissues of least vitality"—widely as to whether the metabolic disorder is always secondary to streptococcal or other infection, or may be the primary cause of fibrositis, as of gout. Treatment will, of course, conform to one opinion or the other—that is, will be directed either to the removal of possible sources of infection or to relieving anabolic or katabolic disorders. The former is the ruling principle of treatment at present in England, and the latter in Continental countries. It was also generally agreed that the resistance of the body, which may easily be damaged by previous specific infection, is low in fibrositis, and ought to be raised. But no clear guidance was given as to how this can be achieved, beyond general hygienic precautions, such as improvement in housing conditions, the prevention of chills, and the provision of works baths and drying rooms.

Two principles of treatment were, however, mentioned. Sir W. Willcox states that skilled massage flushes the part

with fresh antibodies. Others, like Dr. Ray and Dr. Snndell, regard the rheumatic subject as "predisposed to cold," and speak of the value of a "thermal atmosphere" in raising the temperature of the blood and restoring healthy muscular action. I may here interpolate that both these curative factors are combined in a well appointed manipulation bath, such as we used during the war. Heat is more pleasant and manipulation less painful when thus combined, and systematic local treatment tends, not only to dissipate fibrositis, but to improve the resistance of the tissues. Eliminative treatment may, I think, be regarded as a second line of defence. Dr. A. Ellis pointed out the failure of elimination at the age period when fibrositis is most prevalent. It is surprising, since the serious effect of circulating toxins is everywhere admitted, that systematic elimination is not more definitely advocated. Heat, combined with eliminative treatment, may produce the happiest effects, even in chronic and intractable cases, when precisely adapted to individual conditions.

The fibrositis or peri-arthritis in women at or about the climacteric, affecting a very numerous and important group of cases, was well described by Mr. McDonagh as "corresponding to gout." I have long ago expressed the same conclusion, and the same belief as Mr. McDonagh's—that sulphur is of much value in these cases. Sulphur waters and baths and the colloidal preparations of sulphur are undoubtedly beneficial in many rheumatic disorders.—I am, etc.,

London, W.1, March 18th.

R. FORTESCUE FOX.

#### INFECTIVITY OF SMALL-POX IN THE INCUBATION STAGE.

SIR,—With reference to the statement in Dr. Rolleston's book that "small-pox is infectious in all stages of the disease, even in the incubation period before any symptoms have appeared," I quite agree with Drs. Snell and Millard that small-pox is not infectious during the incubation period. I will go further and state emphatically that small-pox is not infectious even after the onset of the symptoms before the rash has appeared. It becomes infectious when the rash appears.

During the epidemic of 1901-2, I saw over 1,000 cases. I visited and kept all "contacts" under observation for sixteen days, and invariably found the rash appearing in secondary cases exactly fourteen days after the rash of the primary case had appeared. During that epidemic, and since, we have taken the "contacts" of isolated cases into our shelters and kept them under observation during the incubation period. During the epidemic six houses were used as shelters, and for several months we had from twenty to twenty-five families at these shelters. Our custom is to remove the patient to the small-pox hospital as soon as the rash appears and to take the family to one of the shelters. If another case occurs among these contacts we are certain that we have all the people who have been exposed to infection from the secondary case under observation. In no instance have I ever known a person to contract the disease earlier than twelve days after the rash had appeared in the previous case. As the incubation period of small-pox is generally twelve days and the rash appears on the fourteenth day, it is fairly plain that the disease is not infectious until the rash appears.

The following incident, which occurred in 1918, may be of interest as additional corroboration:

A girl, M. A., aged 15, worked in a tobacco factory up to February 25th, when she went home from work and was thought to be suffering from a cold. I saw her on March 2nd, when she had a small-pox rash, which, in my opinion, was about three days old. Another girl, S. H., worked in the same factory with M. A., and twelve days afterwards (March 9th) she was taken ill. The rash appeared on March 11th. She was taken ill at her work on the 8th and went home. She was in bed all day on the 9th, but late that night there was an air raid; she got out of bed and went to an air-raid shelter, where she remained for three hours. This air-raid shelter was partly underground, being 8 ft. 3 in. below the pavement level, and the ceiling was 3 ft. 6 in. above the pavement. The room measured 80 ft. by 60 ft. by 11 ft. 9 in., and the windows were boarded up. The number of people at the

shelter during the three hours in question was not known, but in order to ascertain their names and addresses I arranged, with the assistance of the sanitary inspectors, to make a house-to-house visitation of the streets in the vicinity of the air-raid shelter on the following day. In this way we discovered 303 men, women, and children who took refuge in it during the whole of the time that the patient was present; 92 had never been vaccinated, and this number included 66 children under 10 years of age; 125 persons over 10 years of age had been vaccinated in infancy only.

If the patient, whose rash did not appear until the evening of the following day, had been in an infectious condition, we should have had an immediate spread of the epidemic. We had all the conditions favourable for it: (1) At least 283 persons not protected by vaccination, a very large proportion being unvaccinated children; (2) the overcrowded condition of an underground, unventilated room; (3) the physical and mental condition of the contacts; all the children had been taken from bed to the air-raid shelter. It is probable that others, besides the number mentioned above, took refuge in the air-raid shelter that night, but we had no other case of small-pox in the district where the patient had been in the shelter.

With regard to hæmorrhagic small-pox, I believe the patient is infectious when the hæmorrhages occur. It invariably proves fatal before the third day, and therefore before the rash appears.—I am, etc.,

Public Health Officer, Stepney,  
March 17th.

D. L. THOMAS.

#### THE CATARRHAL CHILD.

SIR,—Some remarks made at the meeting of the Bristol Medico-Chirurgical Society reported in the *JOURNAL* of March 21st (p. 557) appear to call for comment.

Speaking on the subject of the "catarrhal child," Dr. Clarke states that the baby should live in the open air "even in a draught," and "even during the bath."

No one will dispute the value of fresh air, but does Dr. Clarke suggest that bathing babies in the open air in this country is a practical proposition for the average parent? And have draughts ever been proved to be beneficial? Most of us find them at least uncomfortable.

As to the rule that visitors to the infant should wear masks, the idea is pleasing from several points of view, but considerable moral courage must be required to inform enthusiastic callers that, while we are very pleased to see them we shall be obliged if they will assume their masks without delay.—I am, etc.,

London, E.15, March 21st.

PHILIP R. KEMP.

#### TESTS FOR DRUNKENNESS.

SIR,—When I was appointed divisional surgeon to the Metropolitan Police I was requested to state that a person was or was not drunk when called upon to give an opinion. This I maintain is an absurdity. One might just as well state that a person is or is not anaesthetized. There are degrees of drunkenness, or alcoholism, just as there are of any other drug.

In reporting a case in the police books such terms as "suffering from effects of alcoholism," "has had some drink," "under the influence of alcohol," are clumsy and of little help to the lawyers.

I suggest that instead of making only two classes, drunk or not drunk, we formulate three classes of alcoholism—first degree, second degree, and third degree—and that these should be recognized as logical distinctions.

AL. 1.—Might include all such persons as had taken some alcohol, and were merry and bright as a result. Such persons would be quite fit to take care of themselves and control a motor car.

AL. 2.—Quarrelsome, flushed face, overfamiliar, talkative, and so forth. Unfit to drive a car.

AL. 3.—Obviously intoxicated and presenting no difficulty whatever other than differential diagnosis.

All the examining doctor would then have to do would be to classify the case and enter in the police book as follows: John Smith, AL. 1, 2, or 3, as the case might be. Penalties, capacities, etc., would all be under formula, so that no further statements would be necessary.—I am, etc.,

B. F. PENDRED, M.R.C.S., L.R.C.P.

Loughton, March 13th.

<sup>1</sup> The Gout in Women, *Proc. Brit. Med. and Clin. Soc.*

## NEED FOR A POST-GRADUATE SCHOOL IN LONDON.

SIR,—As discussions are now taking place on post-graduate facilities for foreigners and for doctors from the provinces, I think it opportune to suggest that something should be done for London men.

A friend in the country once told me that he envied me living near London for the opportunities of post-graduate study. It was therefore quite a disappointment to find that for the several thousand men in and near London nothing suitable is arranged.

Looking down the list issued by the Fellowship of Medicine I find . . . three weeks' course here, two weeks' there, seven guineas for this, many guineas for that. Now how can any doctor, not on a long holiday, give 9 a.m. to 6 p.m. every day, or feel inclined to pay eight guineas when he can only attend, say, two afternoons out of the two weeks' course?

I would like to see a London post-graduate association which would frame a syllabus especially for London men. One afternoon a week, say every Friday, a course of a concentrated four hours of teaching and practical demonstration, to be given at one of the hospitals. This could be varied to suit everyone; a typical afternoon would be: 2 to 3, surgical out-patients; 3 to 3.45, throats; tea; 4.15 to 5, laboratory; 5 to 6, medical cases. Mental disease, anatomy, electricity, etc., could be introduced.

I am sure many a London practitioner would then keep this precious afternoon free; it would be his hospital afternoon. Sometimes he would be too busy to attend—well, nothing is lost; he has his season ticket, so to speak, and better luck next week. To attract men from the fifty-mile radius there must be more than one lecture to make it worth his while coming; the hospital varying gives a varying geographical advantage; the teachers changing each week avoids the "one-note man" overdoing his favourite theme.

I commend the idea to the Fellowship of Medicine. I have admired its lists for a long time and envied those able to put in three weeks at the attractive courses, but I'm for the sea when my summer holiday is due!—I am, etc.,

London, N.W.6, March 24th.

F. MELVILLE HARVEY.

## Obituary.

J. MCGREGOR-ROBERTSON, M.B., C.M., F.R.F.P.S.G.,  
Glasgow.

By the death, which occurred with startling suddenness on March 17th, of Dr. Joseph McGregor-Robertson, F.R.S.Ed., Glasgow has sustained the loss of an outstanding personality. He had been presiding at an address by Colonel L. W. Harrison (Ministry of Health) under the auspices of the National Council for Combating Venereal Diseases, of the Scottish Committee of which he was chairman, and at the conclusion of the lecture proposed a vote of thanks. Immediately afterwards he stepped off the platform on his way to the ante-room and dropped down dead.

Dr. McGregor-Robertson was a native of Glasgow, and was educated at the University; he graduated M.A. in 1876 and M.B., C.M. (with honours) in 1880. After a distinguished career he was appointed Muirhead demonstrator and lecturer in physiology, a post which he filled with conspicuous ability. Two textbooks which he published—*Physiological Physics* and an *Elementary Textbook of Human Physiology*—had a considerable vogue in their day.

General practice attracted him, and he settled in the West End of the city and very soon built up a large practice. Busy as he was, he still found time to maintain his interest in science. Members of the Representative Body who enjoyed his hospitality in 1922 will remember with pleasure the interesting hour they spent in his private laboratory and x-ray room.

Outside the sphere of his immediate practice he had many interests. Reference has been made to his connexion with the National Council for Combating Venereal Diseases.

His work on behalf of Scottish nurses will long be remembered. Largely due to his energetic advocacy, the Scottish Nurses' Association (now the Scottish Nurses' Club) was founded, and is now a flourishing institution, providing a club and bedroom accommodation for fifty nurses, with an average number in residence of thirty. He was closely associated with the late Sir William Macewen in the organization and management of the Princess Louise Scottish Hospital for Limbless Sailors and Soldiers, and after Macewen's death much of the administrative work devolved upon him. When the Parish Council of Glasgow, after the war, decided to restore Stobhill Hospital to its function as a general hospital, he was appointed visiting physician and organizer of the medical service. He held very liberal views of the function of the Poor Law hospital, and his work in that connexion will be enduring. He became a Fellow of the Royal Faculty of Physicians and Surgeons in 1892, and was for some years an active member of the council of that body, as well as examiner in physiology.

The British Medical Association, of which he was for many years a member, is indebted to him for much good service. He had been a member of the council of the Glasgow and West of Scotland Branch, and in 1922-23 served on the special committee to inquire into the notification of venereal disease. He was elected to the Council in 1922, and served on the Scottish Committee from 1923. At the annual general meeting in Glasgow in 1922 he was a member of the executive and secretary of the Reception Committee, and showed very great interest in the success of the meeting. At the time of his death he was chairman and representative of the Glasgow North-Western Division. For a good many years—we cannot now exactly ascertain how many—he was the correspondent of the *BRITISH MEDICAL JOURNAL* in Glasgow.

Gifted with a trenchant and lucid style, his contributions to debate were always arresting, and his opinions always commanded respect. Absolute fearlessness was the dominant note of his character, and he possessed unyielding tenacity of purpose and consuming energy. A hard hitter in controversy, uncompromising where he believed a principle to be involved, he yet made many friends, who mourn his loss.

He leaves a widow and family; one son is in medical practice in Glasgow.

A. A. H. KNIGHT, M.D. EDIN.,  
Kewick.

THE profession and a large circle of friends and old patients (who were also always his friends and he theirs) have suffered a severe loss in the death, at the age of 81, on March 5th, of Dr. A. A. H. Knight, one in whom uprightness of character, largeness of heart, together with a sound knowledge of his profession and intellectual gifts of no mean order, joined in producing an example of the highest type of medical practitioner; and if wealth is to be estimated by the amount of unselfish service ably rendered, or by a harvest of human trustfulness and affection, then surely one of the richest.

Alexander Angus Halley Knight was born on October 7th, 1843, in the parish of Charnside, Berwick, his father, the Rev. George Fulton Knight, being one of those who went out with Chalmers from the Established Church, subsequently becoming Free Church minister at East Wemyss. Educated at the Edinburgh High School and later at Edinburgh University, where, in 1865, he took the degree of M.D. and the diploma of L.R.C.S., after holding the appointment of house-surgeon in the Edinburgh Hospital for Sick Children he acted for a time as assistant to Dr. Rowland of Bootle, and in 1866 succeeded Dr. Rumney of Keswick, where he practised uninterruptedly for close on fifty years.

It was natural that a man of his calibre should make his personality felt among the community at large, and as a member of the old local board, founder and president of the local literary and scientific society, and also of the Derwent (Men's) Club, chairman of the Cottage Hospital House Committee, and as trustee or member of committee of various other charities, he gave unsparingly of his time and talents. His professional appointments included those

## UNIVERSITY OF LEEDS.

At a meeting of the University Council on March 18th resolutions were passed recording deep regret at the death of two of its honorary graduates, Sir Edward Thorpe and Sir Clifford Allbutt: Sir Edward Thorpe was one of the first three professors of the Yorkshire College of Science; Sir Clifford Allbutt, who was a life governor of the Yorkshire College and a life member of the University Court, gave distinguished services to the Leeds School of Medicine, of the staff of which he was a much valued member.

Dr. J. Gordon was appointed lecturer in bacteriology, in succession to Dr. Ross, resigned. Dr. Gordon graduated M.B., Ch.B. in 1918 and has been a demonstrator in the department of pathology and bacteriology for nearly six years.

## UNIVERSITY OF DURHAM.

The following candidates have been approved at the examination indicated:

THIRD M.B., B.Ch.—*Material Medica, Pharmacology, and Pharmacy; Public Health; Medical Jurisprudence; Pathology and Elementary Bacteriology*: R. Abrahams, H. Birk, Evelyn H. Bolt, Ethel Browell, B. A. Dorrner, M. M. Macintyre.

## UNIVERSITY OF GLASGOW.

The following candidates have been approved at the examinations indicated:

FOURTH M.B., Ch.B.—*Medical Jurisprudence, Pathology, and Pharmacy*: A. M. Brown, V. S. Cameron, C. R. Gibson, H. R. Kidd, A. MacArthur, J. L. Maca, C. J. McGhee, D. T. M'Gill, A. M. Murray, D. C. M. Ma, V. Meyer, G. M. Mulhead, A. F. Nimmo, J. O'Hara, D. C. Orr, A. G. Suanes, J. L. Smith, C. H. Stewart, H. S. Strachan, D. Thomas, J. H. Thomson, W. Whitelaw, Jeanie G. Campbell, Mary E. Devine, Elizabeth H. Livingston, Georgina A. M'Nicol, Margaret Mulvein, Vida J. M'F. Stark, Maggie B. Walker, Kathleen M. Warren. *Public Health*: J. G. Anderson, J. Baxter, A. M. Brown, A. Campbell, J. V. M. Davies, J. Durie, C. R. Gibson, H. R. Kidd, D. P. Leiper, S. R. Lipchinsky, S. Lurie, A. MacArthur, J. L. Macaulay, J. A. McCluskie, W. J. McCuller, C. J. McGhee, C. C. McKenzie, A. A. M'Millan, A. N. M'urray, D. C. M. Macpherson, H. W. A. Marshall, A. Mellick, V. Meyer, G. M. Mulhead, D. S. Murray, M. Naftalin, G. R. Taylor, D. Thomas, J. H. Thomson, W. Whitelaw, Mary E. Devine, Elizabeth H. Livingstone, Georgina A. M'Nicol, Margaret Mulvein, Maggie B. Walker.

## UNIVERSITY OF DUBLIN.

## TRINITY COLLEGE.

At the spring commencements in Hilary Term held on March 21st, the following degrees were conferred:

M.D.—M. W. Kaplan, J. W. Scharff.

M.Ch.—D. de Bruija.

M.A.O.—D. J. Malan.

M.B., B.Ch., B.A.O.—W. H. Anderson, G. P. Bamford, J. E. Beatty, Rev. E. A. Bennett, H. Birney, L. C. Brough, J. Crawford, T. G. H. Crawford, R. T. Cronin, J. Cussen, C. J. du Plessis, G. W. Garde, G. F. Gillespie, R. A. Heatley, J. J. Horwich, R. J. G. Hyde, J. M. Johnston, P. N. H. Labuschagne, J. L. Livingston, J. A. MacDonnell, J. G. Maguire, E. J. Marais, C. R. Moore, J. V. Morris, F. M. Purcell, W. A. Redmond, E. T. S. Rudd, I. Strasburg, H. W. Strong, E. J. Walsh, L. M. Whitsitt, R. W. Harle (in absentia).

## SOCIETY OF APOTHECARIES OF LONDON.

The following candidates have passed in the subjects indicated:

SURGERY.—W. Bentley, N. E. Challenger, A. J. M. Davies, A. Kaplan, Y. N. Lal, T. K. Natesan, F. T. Ridley.

MEDICINE.—A. H. Allam, T. K. Natesan, F. T. Ridley.

FORENSIC MEDICINE.—E. H. Boodrie, M. R. Burke, B. Horwitz, T. McD. Kellough, A. Mishriky, C. M. Moody, C. C. Po, F. T. Ridley, B. L. Steele.

MIDWIFERY.—I. H. Mackay, K. V. Mead, E. J. Newman, F. T. Ridley, R. J. Rutherford.

## \* Section II.

The diploma of the society has been granted to Messrs. A. H. Allam, W. Bentley, N. E. Challenger, A. J. M. Davies, Y. N. Lal, A. Mishriky, T. K. Natesan, C. C. Po, and F. T. Ridley.

## The Scribblers.

## ROYAL NAVAL MEDICAL SERVICE.

The annual dinner of the Royal Navy Medical Club will take place at the Trocadero Restaurant, Piccadilly Circus, W.1, on Thursday, April 16th, at 7.30 for 8 p.m. Members who wish to be present are asked to inform the Honorary Secretary, Royal Navy Medical Club, 63, Victoria Street, London, S.W.1, not later than seven clear days before that date.

## DEATHS IN THE SERVICES.

Lieut.-Colonel Henry Thomas Brown, R.A.M.C.(ret.), died at Limerick on February 3rd, aged 81. He was the son of the late Dr. Henry Southwell Brown, was educated at Queen's College, Cork, and graduated M.D. in the Queen's University, Ireland, in 1855; he took the L.R.C.S.I. in the same year. He entered the

army as assistant surgeon on March 31st, 1866, became brigade surgeon lieutenant-colonel in 1892, and retired in 1896. As a regimental medical officer he served in the Ceylon Rifle Regiment and in the 59th Foot, now the 2nd battalion of the East Surrey Regiment. He served in the Ashanti campaign of 1873-74, under Sir Garnet (afterwards Lord) Wolseley, receiving the medal.

Brigade-Surgeon Frederick George Constant, Bengal Medical Service (ret.), died at Eastbourne on February 19th, aged 90. He was the son of John Constant, 5th Dragoon Guards, and, after taking the diplomas of M.R.C.S. and L.S.A. in 1856, entered the I.M.S. as assistant surgeon in 1859, became surgeon major in 1873, and retired with a step of honorary rank in 1882. He served in the Abyssinian war in 1867-68.

Surgeon Major Edward Colson, Bombay Medical Service (ret.), died at Southsea on March 3rd, aged 79. He was the son of the Rev. Charles Colson of Layston, Hereford, was educated at Guy's, and took the diplomas of M.R.C.S. and L.S.A. in 1863. He entered the I.M.S. as assistant surgeon in 1869, became surgeon major after twelve years' service, and retired in 1889.

Surgeon Captain John Christopher Fergusson, R.N.(ret.), died at Menton on February 14th. He was educated at Trinity College, Dublin, where he graduated M.B. and Ch.B. in 1886. Soon afterwards he entered the navy, became fleet surgeon in 1902, and retired as surgeon captain in 1918. He served throughout the late war. He had qualified as interpreter in Hindustani in 1903, and in French in 1907.

## Medical News.

LAST week's return showed a considerable decrease in the number of deaths from influenza in the great towns of England and Wales from 361 to 283. Only three cities other than London (where the deaths decreased from 59 to 36) had 10 or more deaths—namely, Birmingham (19), Liverpool (12), Manchester (15). The notifications of pneumonia for England and Wales are also decreasing (from 1,441 to 1,395). In some parts of the country, however, pneumonia is still increasing—for example, in the North Midlands; and in Manchester the deaths from influenza were more numerous than in the previous week.

THE eleventh annual conference of the National Association for the Prevention of Tuberculosis will be held at the Royal Society of Medicine on July 6th and 7th. Professor Pirquet of Vienna will introduce the discussion on tuberculosis in childhood; Professor Holger Moelgaard of Copenhagen and Professor Knud Faber of Copenhagen will discuss the treatment of tuberculosis by "sanocrysin." It is announced that the Minister of Health is prepared to sanction the payment of the reasonable expenses of three delegates from local authorities. The fee for the conference is 1 guinea, and a copy of the report of the proceedings will be supplied. Further particulars may be obtained from the secretary of the association, Miss F. Stickland, 20, Hanover Square, W.1.

THE Fellowship of Medicine announces that the discussion on post-graduate study in London (see p. 613) will be resumed at the house of the Royal Society of Medicine on April 8th, at 6 p.m. Sir Arbuthnot Lane will again preside, and it is hoped that many members of the medical profession will attend and give their views. On March 30th Mr. Ernest Clarke will lecture on myopia, its diagnosis and treatment, and on April 1st Dr. Robert Knox will give a lantern demonstration of the use of x-rays in the diagnosis of lesions in the right quadrant of the abdomen. Each lecture will be given at 5.30 p.m. in the West Lecture Hall. Three courses, each lasting a fortnight, will commence on April 20th. An intensive course in medicine, surgery, and the specialties, will be held at the Hampstead General Hospital, a course in diseases of children at the Queen's Hospital, Hackney Road, E.2, and a course in proctology at St. Mark's Hospital for the Rectum. In May there will be courses in dermatology; diseases of infants, and of the nose, throat, and ear; and in psychological medicine. Copies of the syllabus of these courses may be obtained from the Secretary to the Fellowship of Medicine, No. 1, Wimpole Street, W.1.

A COURSE in parasitology will be held in the Tropical Division of the London School of Hygiene and Tropical Medicine from April 12th to June 25th. There will be three parts: entomology (Colonel A. Alcock, F.R.S.), helminthology (Professor R. T. Leiper, F.R.S.), protozoology (Dr. J. G. Thomson). The course is intended for students taking the first part of the D.P.H., but there may be room for a few others. The fee is two guineas. Inquiries should be addressed to the Director, care of the Institute of Historical Research, Malet Street, W.C.1.

A PORTRAIT of Dr. G. Reinhardt Anderson, M.B.E., Mayor of Southampton, was unveiled in the Southport Infirmary on March 18th, in recognition of his work as a member for twenty-eight years of the honorary medical staff and for eight years chairman of the medical board.

THE next social evening of the Royal Society of Medicine will be held at 1, Wimpole Street, W.1, on Monday, May 4th. The president, Sir St. Clair Thomson, will receive the guests at 8.30 p.m., and at 9.30 Dr. Robert Hutchison will give an address on Dr. Samuel Johnson and medicine, which will be illustrated with eighteenth century portraits.

DR. G. LEVEN will deliver a course of four lectures on the treatment of anorexia, obesity, and leanness at the Hôtel Drouin in Paris on May 7th, 14th, 21st, and 28th.

A COMPLETE course of French study will be held at the Sorbonne, Paris, during the summer. The first part of the course, extending from July 11th to August 9th, consists of a preparatory course each morning, including phonetics; two hours' practical French reading, grammar, and conversation; in the afternoons lectures on the history of France will alternate with excursions in Paris. From August 9th to 23rd a more advanced course will be given by the leading professors of the Sorbonne and the Faculty of Law, who will deal in thirty-six morning lectures with the chief literary, political, and economic questions of France in the present day. The afternoons will be devoted to excursions in Paris. At each week-end during the course visits will be paid to towns of historical or artistic interest, and from August 23rd to 31st a journey in small groups, under the guidance of the professors, will be made to one or other of the eastern, southern, or western parts of France. The director of the course is M. Henri Goy, Directeur du Bureau des Renseignements Scientifiques, Sorbonne, Paris, to whom all communications should be addressed.

AN international congress of physiotherapy—the first since the war—will be held at Leningrad from May 23rd to 27th, when the following subjects will be discussed: (1) light therapy, introduced by Professor S. A. Brunstein; (2) Roentgen therapy, introduced by Professor A. K. Jakovsky; (3) iouotherapy, introduced by Professor S. B. Wernol; (4) physical treatment of tuberculosis, introduced by Professor N. M. Rootnitsky (pulmonary tuberculosis) and Dr. F. G. Kornel (surgical tuberculosis); (5) physiotherapy of motor disturbances, introduced by Professor A. L. Polen; (6) physiotherapy of endocrine disorders, introduced by Professor R. C. Metzer-nitzky. An exhibition of instruments connected with physiotherapy will be held during the congress.

THE sixth Italian Congress of Radiology will be held at Trieste from May 7th to 10th inclusive. Professor Pasquale Tardola of Naples will deal with the radiology of the biliary system, Professor Giacomo Pesci of Genoa with the radiology of pleural diseases, and Professor Eugenio Milani of Rome with radiotherapy of the endocrine system. May 10th (Sunday) will be devoted to an excursion to the grotto of Postumia. The subscription for non-members of the Società Italiana Radiologia Medica is 20 lira, and relatives of those attending may obtain the privilege of reduced railway fares on payment of 10 lira. Applications should be addressed before March 30th to the Congress President, Dr. Massimiliano Gortan, Ospedale Civile Regina Elena, Trieste.

AN International Conference on the Use of Esperanto in Pure and Applied Sciences will be held in Paris from May 14th to 16th inclusive. Inquiries should be addressed to Mr. F. E. Wadham, 19, Grandison Road, London, S.W.11.

THE annual meeting of the Cremation Society of England will be held in the Adam Hall at 12, Stratford Place, W.1, on Wednesday, April 8th, at 3 o'clock. The council's report, to be presented to the meeting, congratulates the society and those interested in its work on the success which has attended its efforts. During the year under review, notwithstanding the satisfactory state of the national health, the number of cremations carried out in Great Britain was increased by 404, or 20 per cent., the actual number having been 2,390, against 1,985 in the previous year. Of this total the four crematoriums in London accounted for 1,429. The accounts and balance sheet show a highly satisfactory financial position. Membership has also greatly increased during the past year.

ON his retirement from being medical officer to the Brighton Board of Guardians after forty-two years' service Dr. Douglas M. Ross has been presented with a framed illuminated address, subscribed for by members of the board, in recognition of the zeal and devotion with which he has discharged his duties.

ON the promotion of Sir A. Symonds, K.C.B., Second Secretary, to be Secretary to the Board of Education, Mr. E. R. Forber, C.B., C.B.E., has been appointed Deputy Secretary to the Ministry of Health, and Mr. L. G. Brock, C.B., and Mr. I. G. Gibbon, C.B.E., Principal Assistant Secretaries.

A DONATION of £10,000 has been given by Miss Margaret Clarke of Glasgow towards the building of a convalescent home for the Glasgow Royal Infirmary in memory of her father, Dr. Samuel Clarke, who was well known in Glasgow sixty years ago.

THE current issue of the quarterly *Bulletin of the International Union against Tuberculosis* contains a detailed account of the fourth International Tuberculosis Conference, held at Lausanne last August, with a report of the administrative session and a summary of the scientific discussions. Sir Robert Philip contributes an article on anticipatory detubercularization, and A. K. Krause and H. S. Willis describe experiments showing that the rate of dissemination of virulent tubercle bacilli in normal guinea-pigs is far more rapid than in animals that have been immunized, the proportions being from three to four days in the former case, as compared with seven in the latter.

THE forty-ninth annual meeting of the German Society of Surgery will be held in Berlin from April 15th to 18th. The programme appears in the *Zentralblatt für Chirurgie* of March 14th.

A SPECIAL institute has been established for the treatment of scabies at Leningrad, where the methods employed are those in use at the Hôpital St. Louis, Paris.

THE celebration of the centenary of the birth of Hippolyte Duprat, a French naval medical officer who forsook medicine for poetry and music, is being organized at Tonlon.

THE February issue of the *Deutsche Zeitschrift für Chirurgie* contains a portrait of the late Professor Trendelenburg, and a memoir of him by the editor, Professor Saengerhach of Munich.

THE eleventh centenary of the University of Pavia will be celebrated from May 20th to 22nd.

## Letters, Notes, and Answers.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *BRITISH MEDICAL JOURNAL* alone unless the contrary be stated. Authors desiring reprints of their articles published in the *BRITISH MEDICAL JOURNAL* are requested to communicate with the Financial Secretary and Business Manager, 429, Strand, W.C.2, on receipt of proof.

ALL communications with reference to advertisements as well as orders for copies of the *JOURNAL* should be addressed to the Financial Secretary and Business Manager, 429, Strand, London, W.C.2. Attention to this request will avoid delay. Communications with reference to editorial business should be addressed to the Editor, *BRITISH MEDICAL JOURNAL*, 429, Strand, W.C.2.

CORRESPONDENTS who wish notice to be taken of their communications should authenticate them with their names—not necessarily for publication.

Communications intended for the current issue should be posted so as to arrive by the first post on Monday or at latest be received not later than Tuesday morning.

THE telephone number of the *BRITISH MEDICAL ASSOCIATION* and *BRITISH MEDICAL JOURNAL* is Gerrard 2630 (Internal Exchange).

The telegraphic addresses are:

EDITOR of the *BRITISH MEDICAL JOURNAL*, Aitiology Westrand, London.

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc.), Articulate Westrand, London.

MEDICAL SECRETARY, Mediscera Westrand, London.

The address of the Irish Office of the *British Medical Association* is 16, South Frederick Street, Dublin (telegrams: *Bacillus, Dublin*; telephone: 4737 Dublin), and of the Scottish Office, 6, Rutland Square, Edinburgh (telegrams: *Associate, Edinburgh*; telephone: 4361 Central).

## QUERIES AND ANSWERS.

### SODIUM NUCLEINATE IN PNEUMONIA.

DR. F. M. GARDNER-MEDWIN (Angorfa, St. Asaph, North Wales) writes: May I appeal to all practitioners who have used intramuscular injections of sodium nucleinate in the treatment for pneumonia, as set out in my paper in the *BRITISH MEDICAL JOURNAL*, July 12th, 1924, to let me know the results of their treatment in statistical form—stating whether the crisis was precipitated within about forty-eight hours of the injection? Any such information would be gratefully received by me and permission to use the statistics in any way I choose would be appreciated. The possession of a weapon of precision such as this in a disease where hitherto expectant treatment has been employed is so important, in my opinion, that the only justification for neglecting to use it is failure to obtain results or refusal to believe the results obtained by others.

### TREATMENT OF ASTHMA.

IN reply to "H. C.'s" question about asthma (March 7th, p. 458), a correspondent informs us that he has found elbon eiba to give relief in many long-standing cases. The amount he gives is 30 to 60 grains a day, according to the severity of the symptoms. A note on elbon eiba was published in our columns of June 7th, 1924 (p. 1009). It is a combination of cinnamic acid and oxyphenylurea, and was introduced as an antipyretic and disinfectant of low toxicity.

## INCOME TAX.

To a firm of chartered accountants acting for a medical man in Scotland we tender the following advice:

**Defence Unions.**—The best course is for our correspondents to refer to the Medical and Dental Defence Union of Scotland, as that body might wish to consider the question of taking up with the Board of Inland Revenue the proposed arrangement which applies to one of the

**Accident and Sickness Premiums.**—is no legal claim to deduct sums expended as premiums on accident or sickness policies. Rule 3 (a) of Cases I and II, Schedule D, provides that "any expenses not being money wholly and exclusively laid out or expended for the purpose of the trade or profession" shall not be deducted for income-tax purposes. In the rule in *Strong v. Woodfield*, [1905] A.C. 131, it is not enough that the disbursement is made out of the profits of the trade, or is connected with the trade, or is made out of the profits of the trade. It must be made for the purpose of earning the profits. That dictum is, we think, pertinent. The premiums in question are paid not "for the purpose of earning the assessable profits," but to provide receipts, which will not be assessable, when the taxable income is reduced by the happening of the contemplated contingencies. There is one other point worth mentioning. The attitude of the Revenue authorities at present is, we understand, that while they do not consider that a legal practitioner has a legal title to an allowance for the sums paid to a locumtenent during illness, they raise no objection to such deductions being claimed and allowed. This probably meets the equities of the situation fairly well. The position of

(a) he cannot deduct it; (b) he does not; (c) he is as a matter of practice allowed to deduct his special expenditure in providing a locumtenent during illness, etc.

## LETTERS, NOTES, ETC.

## A DISCLAIMER.

DR. HECTOR MUNRO (London, W.1) has written to us disclaiming publication in the lay press of an m. We have received a communication concerned, who writes: "This matter was referred to in J, as a journalist, by mistake, and

## HERPES ZOSTER AND VARICELLA.

We have received a number of further communications on this subject.

DR. J. M. COWIE (M.O.H. Burton-on-Trent) writes: The many cases recorded of the apparent connexion between herpes zoster and varicella are of much interest, and some cases equally important are also known to me, but I have seen so far no record of its introduction into the town every case of chicken-pox has been investigated by the medical officer of health or the assistant medical officer of health. At the same time careful inquiries were made as to the previous occurrence in the household of cases of herpes zoster. During the period of just over two years ending December 31, 1922, the following histories of were obtained:

1. Male, aged 21. Rash November 19th, 1922. Visited November 21st.

November 23rd.

November 3rd.

Visited January 16th.

Visited September 10th.

Mother had shingles about fourteen days before.

6. Male, aged 5. Rash November 24th, 1924. Visited December 1st.

Mother had been in bed with herpes zoster for three weeks. Patient slept in same bed.

7. Female, aged 3. Rash July 18th, 1924. Visited July 21st. Elder sister

8. M. Visited September 10th.

Grand. Visited November 7th.

9. M. Mother had herpes zoster two weeks before.

The cases with a history of previous herpes zoster in the home, therefore, numbered 9, which gives a proportion of 1.1 per cent. of cases and 1.6 per cent. of families. No inquiries were made as to any subsequent cases of shingles occurring in these houses. So far as this investigation goes, the frequency of the relationship of these two diseases hardly allows any conclusion to be come to other than that the connexion is purely casual.

DR. J. LESLIE ORR (Lochmahen) writes: I desire to record another instance where these two diseases occurred together and is strongly suggested. A female supraorbitalis about the end of her daughter, aged about 20, which, mentioned by Dr. Ritchie (February 14th, p. 305), were also manifest—namely, (1) there were no other cases of chicken-

pox occurring in the neighbourhood, and (2) the fourteen days' interval between the onset of the two diseases. Further reference to these conditions is made by Dr. R. C. T. Evans (March 14th, p. 503). Now chicken-pox is generally understood to be a disease of childhood and most liable to occur between the second and sixth years; also, adults who have not had the disease in childhood are very liable to be attacked. It would certainly be interesting to ascertain if chicken-pox associated with herpes zoster occurred only in people who had not suffered from the former disease. Might I suggest that this may account for the small number of cases recorded? If this suggestion cannot be borne out, then I think that the coincidence of the two diseases is thought to be infrequent simply because many are not aware of any possible relationship, and failure of others to record cases when they do occur. It is also possible that many cases of chicken-pox associated with herpes zoster escape notice, owing to the very mild nature of the attack of the former ailment. This is the first occasion on which I have noticed the two diseases in the same family and at the same time.

DR. A. GORDON WILSON (Penistone, Sheffield) writes: May I add another observation to those already recorded supporting the hypothesis that varicella can be contracted by contact with a sufferer from herpes? On January 30th I saw a child, aged 4, suffering from chicken-pox, the spots being then two to three days old. There was no other case of varicella in the vicinity, but the mother told me the child had been away from home and had only returned fourteen days before. On seeing the child again, I asked her various questions about the "germ" of the disease, and she told me that there was a theory that the "germs" were identical. They said, "and went on to say that they were wrong" return, which was on January 9th, not 16th a neighbour had called in for an hour, complained of feeling very ill, had visited the doctor, and next day was found to have "shingles." I found on inquiry she had had a severe attack of herpes of the fifth nerve.

DR. E. C. K. KENDERDINE (Coventry) writes: On January 23rd, 1925, Miss A—J—, aged 19, developed intercostal herpes zoster. On February 9th her younger sister developed typical varicella. She was 4 years old, and we could not trace contact with other varicella patients.

DR. GEORGE PERNET (London, W.1) writes: With reference to Dr. R. C. T. Evans's case of "Concurrent herpes zoster and varicella" (March 14th, p. 503), the condition described would, dermatologically speaking, come into the category of generalized herpes zoster, details of which will be found in textbooks of skin diseases. I published an instance of such in a man aged 80, very similar to Dr. Evans's case, in 1914 (*Brit. Journ. Derm.*, xxvi, p. 392).

## DIPHTHERIA IN THE AGED.

DR. J. OWEN REID (Lochcarron, Ross-shire), with reference to Dr. Muir's memorandum (March 21st, p. 552) on a case of diphtheria at the age of 72, writes: I have recently attended two women, aged 63 and 73, suffering from diphtheria. In both cases diagnosis was confirmed by bacteriological examination. The first case died from heart failure on the fifth day of illness, but the lady of 73, who has now been ill for ten days, is doing very well, and will, I hope, make a complete recovery. These cases lived many miles apart, were the only cases in the district at the time, and, curiously enough, both were cripples.

DR. LEWIS GRANT (Neston, Cheshire) sends notes of a case in which a lady showed signs of typical membranous diphtheria in 1910 (confirmed by bacteriological examination). "She developed post-diphtheritic paralysis of the palate, but this cleared up. At the time she was in her 80th year, and is now hale and hearty in her 95th year, her birthday being next July. She lives with her youngest sister, who is now in her 93rd year."

## "PRACTICAL BIOCHEMISTRY."

DRS. W. A. OSBORNE and W. L. YOUNG (University of Melbourne) write: It may appear ungrateful, in view of your appreciative review of our book, *Elementary Practical Biochemistry*, in your issue of November 15th, 1924, to reply to some of the criticisms, but a misunderstanding has arisen which is easily rectified. Your review gives a list of most important biochemical procedures and applications which are omitted from the volume, such as quantitative estimation of sugar in blood, the use of the polarimeter and colorimeter, analysis of the faeces, and many more. There was a time when reviewers were charged with reading the preface only; in this instance the process has been reversed, for a perusal of our preface would have informed your reviewer that the book had been prepared in volumes in process of preparation—one d and advanced methods and the other to cli

## VACANCIES.

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 42, 44, 45, 48, and 49 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 46 and 47. A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 127.

# The Theoretical Basis OF THE SANOCRYSIN TREATMENT OF TUBERCULOSIS.

BY  
HOLGER MOELLGAARD, M.D.,

PROFESSOR OF PHYSIOLOGY, ROYAL VETERINARY AND AGRICULTURAL  
COLLEGE, COPENHAGEN.

ALTHOUGH chemical substances have been employed to a very large extent in the treatment of tuberculosis no real chemotherapy of this disease has hitherto been developed. The treatment here described represents an attempt to build up a chemotherapy in the sense of Ehrlich and Morgenroth; it cannot, however, be too strongly emphasized that this treatment is to be considered as a beginning only, and as probably showing a way out of the present *embarras des richesses* in the therapy of tuberculosis.

Chemotherapy in the sense of Ehrlich is not to be understood merely as treatment with chemical substances only, and its effect is not due to any local action at the site of injection. Chemotherapy means the introduction into an infected organism of a substance having a directly injurious influence on the parasite and forcing this influence upon the parasite at long distances from the place of introduction. The possibility of such effect is intimately connected with a *specific affinity* of the substance for the parasite. Without such affinity it is hopeless to attempt to influence the parasites in any generally infected organism by means of chemical agents. As a specific affinity of any chemical substance to any parasite hardly exists without some affinity to the cells of the infected organism itself, the rate of parasitotropy to organotropy decides the question of the applicability of any substance as a chemotherapeutic agent. Ehrlich expressed this fact by means of the chemotherapeutic index. The existence of this index, however, means that a substance which is poisonous to a parasite will also exercise some toxic effect upon the infected organism. It is for science to reduce this toxic effect as much as possible, but it is necessary to emphasize the fact that even in the case of the most complete reduction of organotropy patients having a lesser tolerance to a certain compound than the average will be met with. Every injection of a chemical substance into the blood of any human being, therefore, always implies some risk, which must be balanced against the risk of giving no chemotherapeutic treatment.

To kill and dissolve bacilli in an organism by means of a bactericidal substance very often has the same effect as to inject killed or avirulent cultures—that is, it has an immunizing effect. The injection of the bactericidal substance produces an "*ictus immunitarius*" (Ehrlich). Hence chemotherapy not only means bactericidal treatment, but also indirect immunization with liberated antigen. It may, however, under certain conditions produce another indirect effect. If the antigen is very toxic or is liberated in very large amounts, or the capacity of the organism for building antibodies for one reason or another is diminished, the injection of the bactericidal substance produces a more or less grave toxæmia, increasing in some cases to a deadly effect. We are already acquainted with such cases in the chemotherapy of spirillosis, and present knowledge of tuberculosis is in reality sufficient to make us expect the same to happen in the chemotherapy of that disease also.

The natural reaction of the therapist to this is to diminish the dose of the bactericidal substance. It must, however, be clearly understood that the effect not only depends on the quantity of the dose, but also on the amount of easily influenceable bacilli in the organism; further experience of chemotherapy has shown us that minimal doses are not only without effect, but in some cases even stimulate the disease ("*effectus contrarius*")—Ehrlich. Reduction of the dose, therefore, does not always solve the question of toxæmia. Where this effect is prominent

chemotherapeutic treatment can hardly be carried through without the help of an active or passive immunization of the infected organism against the liberated toxins. In these cases clinical treatment must be carried out as a combined chemo- and sero-therapeutic treatment.

These are the principal ideas of chemotherapy founded on the work of Ehrlich and built up on the numerous investigations following in the wake of salvarsan.

For the last twenty years numerous chemical substances have been tried against tuberculosis, and the investigations into the influence of chemicals upon the tubercle bacilli outside and inside the organism are legion, the substances used ranging from dyestuffs to organic and inorganic compounds of heavy metals. In recent times German workers have made extensive investigations into the effect of heavy metals on tuberculosis (Tinkler, v. Linden, Meissen, Strauss, Bruch and Glück, Feldt and Spies, Bethmann, Juncker, Mayer, Pekanowitsch, Kolle and Schlossberger, Görke and Töppich, and others), as have also certain French, English, and American investigators (Breton, Hollande and Gaté, White, de Wit, Wells, Long, Cathwell, Leard, and others).

There is not space here to record the details of these investigations, but as far as I can see their general results may be expressed by saying that they have proved that many compounds of heavy metals have a more or less pronounced growth-preventing influence on tubercle bacilli in culture, and that some of these compounds when injected intravenously retard the death of small tuberculous animals (rabbits, guinea-pigs), making the tuberculous lesions develop into a more sclerotic type. No real curative effect has, however, been observed.

From the failure to produce such effect, as well as from the fact that most of the metallic compounds employed have been too poisonous to the organism to be used in bigger doses in man, a new idea arose, supported first by pure theoretical considerations, but later on by experimentally proved facts, especially in Denmark (Walbum). In 1917 Feldt set forth his idea that the influence of the various metallic compounds (of gold, mercury, copper, bismuth, etc.) on the tuberculous processes is the result of a pure catalytic effect stimulating the natural reactions of defence of the organism—that is, its immunizatory processes. As a catalyser acts in very small concentrations, the logical consequence of this idea was the introduction of minimal doses into the therapeutics of tuberculosis. Feldt accordingly reduced the doses of krysolgan to a few milligrams injected at long intervals.

From Feldt's published statement it appears, as far as I can see, that this idea at the beginning was an ingenious but purely theoretical speculation. In recent times the possibility of exercising a stimulating effect on the production of antibodies by intravenous injections of small doses of various metallic salts has been proved by Walbum, and the whole idea of getting a clinical effect in this way supported by experimental facts.

On the other hand, no such clinical effect has at present been observed from most of the employed metallic compounds. Krysolgan seems only to have a detoxicating effect in certain cases of pulmonary tuberculosis and to cause quick healing in some cases of localized tuberculosis. The effect of the catalyser might, however, depend on its concentration in the body, as pointed out by Walbum, and recent investigations by him give support to this idea. Possibly, therefore, better results may be secured with some concentrations than with others, and there may be hope of something coming from the rational study of the influence of variations of the concentrations of metallic ions in the infected organism.

On the other hand, two things should never be forgotten: first, that the introduction of the *minimal dose* into human therapeutics in reality makes the assertion of the inefficiency of any substance on any kind of disease very difficult, especially in the case of the more chronic diseases, such as tuberculosis; and secondly, that a catalyser only augments the velocity of reaction and never alters the direction of chemical processes. By introducing a catalyser into a chemical system, whether a simple or complex system such as the organism, we cannot control the final

## INCOME TAX.

To a firm of chartered accountants acting for a medical man in Scotland we tender the following advice:

**Defence Unions.**—The best course is for our correspondents to refer to the Medical and Dental Defence Union of Scotland, as that body might wish to consider the question of taking up with the Board of Inland Revenue the point that it be admitted to the arrangement which applies to one or two kindred bodies.

**Accident and Sickness Premiums.**—It seems clear that there is no legal claim to deduct sums expended as premiums on accident or sickness policies. Rule 3 (a) of Cases I and II, Schedule D, provides that "any expenses not being money wholly and exclusively laid out or expended for the purpose of the trade or profession" shall not be deducted for income-tax purposes. In commenting on this rule in *Strong v. Woodfield*, [1905] A.C. 453, Lord Davey said: "It is not enough that the disbursement is made in the course of or is connected with the trade, or is made out of the profits of the trade. It must be made for the purpose of earning the profits." That dictum is, we think, pertinent. The premiums in question are paid not "for the purpose of earning the assessable profits," but to provide receipts, which will not be assessable, when the taxable income is reduced by the happening of the contemplated contingencies. There is one other point worth mentioning. The attitude of the Revenue at present is, we understand, that while a legal practitioner has a legal title to be paid to a locumtenent during illness, they raise no objection to such deductions being claimed and allowed. This probably meets the equities of the situation fairly well. The position of the practitioner would therefore seem to be: (a) he cannot deduct the premiums on his accident, etc., policy; but (b) he does not pay tax on any benefits received under the policy; and (c) he is as a matter of practice allowed to deduct his special expenditure in providing a locumtenent during illness, etc.

## LETTERS, NOTES, ETC.

## A DISCLAIMER.

Dr. HECTOR MUNRO (London, W.1) has written to us disclaiming responsibility for a recent publication in the lay press of an article in which we have received a communication from a person concerned, who writes: "This matter was referred to in an informal conversation I had with Dr. Munro, I, as a journalist, made use of the information he gave me, and by mistake, and without his authority, mentioned his name."

## HERPES ZOSTER AND VARICELLA.

WE have received a number of further communications on this subject.

Dr. J. M. COWIE (M.O.H. Burton-on-Trent) writes: The many cases recorded of the apparent connexion between herpes zoster and varicella are of much interest, and some cases equally important are also known to me, but I have seen so far no record of any statistical investigation of this subject. Chicken-pox has been a notifiable disease in this borough since November, 1922, and owing to the proximity of small-pox and the likelihood of its introduction into the town every case of chicken-pox has been investigated by the medical officer of health or the assistant medical officer of health. At the same time careful inquiries were made as to the previous occurrence in the household of cases of herpes zoster. During the period of just over two years ending 31st December 1924, 813 cases of chicken-pox were notified. Of these cases the following histories of previous herpes zoster in the household were obtained:

1. Male, aged 11. Rash November 21st.
2. Female, aged 10. Rash November 23rd.
3. Male, aged 10. Rash November 23rd.
4. Male, aged 10. Rash November 23rd.
5. Male, aged 10. Rash November 23rd.
6. Male, aged 5. Rash November 23rd. Visited December 1st.
7. Female, aged 3. Rash July 18th, 1924. Visited July 21st. Elder sister.
8. Male, aged 10. Rash November 23rd. Visited September 10th.
9. Male, aged 10. Rash November 23rd. Visited November 7th.

The cases with a history of previous herpes zoster in the home, therefore, numbered 9, which gives a proportion of 1.1 per cent. of cases and 1.6 per cent. of families. No inquiries were made as to any subsequent cases of shingles occurring in these houses. So far as this investigation goes, the frequency of the relationship of these two diseases hardly allows any conclusion to be come to other than that the connexion is purely casual.

Dr. J. LESLIE ORR (Lochmaben) writes: I desire to record another instance where these two diseases occurred together and where some definite relationship is strongly suggested. A female patient developed herpes zoster supraorbitalis about the end of January last. A fortnight later her daughter, aged about 20, which, mentioned by Dr. Ritchie (February 14th, p. 305), were also manifest—namely, (1) there were no other cases of chicken-

pox occurring in the neighbourhood, and (2) the fourteen days' interval between the onset of the two diseases. Further reference to these conditions is made by Dr. R. C. T. Evans (March 14th, p. 503). Now chicken-pox is generally understood to be a disease of childhood and most liable to occur between the second and sixth years; also, adults who have not had the disease in childhood are very liable to be attacked. It would certainly be interesting to ascertain if chicken-pox associated with herpes zoster occurred only in people who had not suffered from the former disease. Might I suggest that this may account for the small number of cases recorded? If this suggestion cannot be borne out, then I think that the coincidence of the two diseases is thought to be infrequent simply because many are not aware of any possible relationship, and failure of others to record cases when they do occur. It is also possible that many cases of chicken-pox associated with herpes zoster are to the very mild nature of the attack of the latter disease, which is the first occasion on which I have noticed the same family and at the same time.

Dr. A. GORDON WILSON (Penistone, Sheffield) writes: May I add another observation to those already recorded supporting the hypothesis that varicella can be contracted by contact with a sufferer from herpes? On January 30th I saw a child, aged 4, suffering from chicken-pox, the spots being then two to three days old. There was no other case of varicella in the vicinity, but the mother told me the child had been away from home and had only returned fourteen days before. On seeing the child again the parents asked me if I was a doctor. I said, "Yes, I am a doctor of chicken-pox, and I am a doctor of varicella and of measles."

Dr. E. O. K. KENDERDINE (Coventry) writes: On January 23rd, 1925, Miss A.—J., aged 19, developed intercostal herpes zoster. On February 9th her younger sister developed typical varicella. She was 4 years old, and we could not trace contact with other varicella patients.

Dr. GEORGE FERNET (London, W.1) writes: With reference to Dr. R. C. T. Evans's case of "Concurrent herpes zoster and varicella" (March 14th, p. 503), the condition described would, in my opinion, be classified as a case of generalized herpes zoster. I have found in textbooks of skin diseases, I have found in a man aged 60, very similar to I (Brit. Journ. Derm., xxvi, p. 393).

## DIPHTHERIA IN THE AGED.

Dr. J. OWEN REID (Lochearn, Ross-shire), with reference to Dr. Muir's memorandum (March 21st, p. 552) on a case of diphtheria at the age of 72, writes: I have recently attended two women, aged 69 and 73, suffering from diphtheria. In both cases diagnosis was confirmed by bacteriological examination. The first case died from heart failure on the fifth day of illness, but the lady of 73, who has now been ill for ten days, is doing very well, and is recovering. These cases lived many years in the district at the time, and, in fact, were ripples.

Dr. LEWIS GRANT (Neston, Cheshire) sends notes of a case in which a membranous diphtheria was found on examination. "She developed the disease in the palate, but this cleared up. At the time she was in her 80th year, and is now hale and hearty in her 95th year, her birthday being next July. She lives with her youngest sister, who is now in her 93rd year."

## "PRACTICAL BIOCHEMISTRY."

DRS. W. A. OSBORNE and W. L. YOUNG (University of Melbourne) write: It may appear to some of your appreciative readers that your review of our book "Practical Biochemistry, in your issue of November 1st, is one of the criticisms, but a misunderstanding has arisen which is easily rectified. Your review gives a list of most important biochemical procedures and applications which are omitted from the volume, such as quantitative estimation of sugar in blood, the use of the polarimeter and colorimeter, analysis of the faeces, and many more. There was a time when reviewers were charged with reading the preface only; in this instance the process has been reversed, for a perusal of our preface would have informed your reviewer that the book has two companion volumes in process of preparation—one devoted to quantitative and advanced methods and the other to clinical applications.

## VACANCIES.

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 42, 44, 45, 48, and 49 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 46 and 47. A short summary of vacant posts notified in the advertisement columns appears in the Supplement at page 127.

## The Theoretical Basis OF THE SANOCRYLIN TREATMENT OF TUBERCULOSIS.

BY

HOLGER MOELLGAARD, M.D.,

PROFESSOR OF PHYSIOLOGY, ROYAL VETERINARY AND AGRICULTURAL  
COLLEGE, COPENHAGEN.

ALTHOUGH chemical substances have been employed to a very large extent in the treatment of tuberculosis no real chemotherapy of this disease has hitherto been developed. The treatment here described represents an attempt to build up a chemotherapy in the sense of Ehrlich and Morgenroth; it cannot, however, be too strongly emphasized that this treatment is to be considered as a beginning only, and as probably showing a way out of the present *embarras des richesses* in the therapy of tuberculosis.

Chemotherapy in the sense of Ehrlich is not to be understood merely as treatment with chemical substances only, and its effect is not due to any local action at the site of injection. Chemotherapy means the introduction into an infected organism of a substance having a directly injurious influence on the parasite and forcing this influence upon the parasite at long distances from the place of introduction. The possibility of such effect is intimately connected with a specific affinity of the substance for the parasite. Without such affinity it is hopeless to attempt to influence the parasites in any generally infected organism by means of chemical agents. As a specific affinity of any chemical substance to any parasite hardly exists without some affinity to the cells of the infected organism itself, the rate of parasitotropy to organotropy decides the question of the applicability of any substance as a chemotherapeutic agent. Ehrlich expressed this fact by means of the chemotherapeutic index. The existence of this index, however, means that a substance which is poisonous to a parasite will also exercise some toxic effect upon the infected organism. It is for science to reduce this toxic effect as much as possible, but it is necessary to emphasize the fact that even in the case of the most complete reduction of organotropy patients having a lesser tolerance to a certain compound than the average will be met with. Every injection of a chemical substance into the blood of any human being, therefore, always implies some risk, which must be balanced against the risk of giving no chemotherapeutic treatment.

To kill and dissolve bacilli in an organism by means of a bactericidal substance very often has the same effect as to inject killed or avirulent cultures—that is, it has an immunizing effect. The injection of the bactericidal substance produces an “*iocus immunicatorius*” (Ehrlich). Hence chemotherapy not only means bactericidal treatment, but also indirect immunization with liberated antigen. It may, however, under certain conditions produce another indirect effect. If the antigen is very toxic or is liberated in very large amounts, or the capacity of the organism for building antibodies for one reason or another is diminished, the injection of the bactericidal substance produces a more or less grave toxæmia, increasing in some cases to a deadly effect. We are already acquainted with such cases in the chemotherapy of spirilloles, and present knowledge of tuberculosis is in reality sufficient to make us expect the same to happen in the chemotherapy of that disease also.

The natural reaction of the therapist to this is to diminish the dose of the bactericidal substance. It must, however, be clearly understood that the effect not only depends on the quantity of the dose, but also on the amount of easily influenceable bacilli in the organism; further experience of chemotherapy has shown us that minimal doses are not only without effect, but in some cases even stimulate the disease (“*effectus contrarius*”—Ehrlich). Reduction of the dose, therefore, does not always solve the question of toxæmia. Where this effect is prominent

chemotherapeutic treatment can hardly be carried through without the help of an active or passive immunization of the infected organism against the liberated toxins. In these cases clinical treatment must be carried out as a combined chemo- and sero-therapeutic treatment.

These are the principal ideas of chemotherapy founded on the work of Ehrlich and built up on the numerous investigations following in the wake of salvarsan.

For the last twenty years numerous chemical substances have been tried against tuberculosis, and the investigations into the influence of chemicals upon the tubercle bacilli outside and inside the organism are legion, the substances used ranging from dyestuffs to organic and inorganic compounds of heavy metals. In recent times German workers have made extensive investigations into the effect of heavy metals on tuberculosis (Tinkler, v. Linden, Meissen, Strauss, Bruch and Glück, Feldt and Spies, Bethmann, Juncker, Mayer, Pikanowitsch, Kolle and Schlossberger, Görke and Tappich, and others), as have also certain French, English, and American investigators (Breton, Hollande and Gaté, White, de Wit, Wells, Long, Cathwell, Leard, and others).

There is not space here to record the details of these investigations, but as far as I can see their general results may be expressed by saying that they have proved that many compounds of heavy metals have a more or less pronounced growth-preventing influence on tubercle bacilli in culture, and that some of these compounds when injected intravenously retard the death of small tuberculous animals (rabbits, guinea-pigs), making the tuberculous lesions develop into a more sclerotic type. No real curative effect has, however, been observed.

From the failure to produce such effect, as well as from the fact that most of the metallic compounds employed have been too poisonous to the organism to be used in bigger doses in man, a new idea arose, supported first by pure theoretical considerations, but later on by experimentally proved facts, especially in Denmark (Walbum). In 1917 Feldt set forth his idea that the influence of the various metallic compounds (of gold, mercury, copper, bismuth, etc.) on the tuberculous processes is the result of a pure catalytic effect stimulating the natural reactions of defence of the organism—that is, its immunizatory processes. As a catalyst acts in very small concentrations, the logical consequence of this idea was the introduction of minimal doses into the therapeutics of tuberculosis. Feldt accordingly reduced the doses of krysolgan to a few milligrams injected at long intervals.

From Feldt's published statement it appears, as far as I can see, that this idea at the beginning was an ingenious but purely theoretical speculation. In recent times the possibility of exercising a stimulating effect on the production of antibodies by intravenous injections of small doses of various metallic salts has been proved by Walbum, and the whole idea of getting a clinical effect in this way supported by experimental facts.

On the other hand, no such clinical effect has at present been observed from most of the employed metallic compounds. Krysolgan seems only to have a detoxicating effect in certain cases of pulmonary tuberculosis and to cause quick healing in some cases of localized tuberculosis. The effect of the catalyst might, however, depend on its concentration in the body, as pointed out by Walbum, and recent investigations by him give support to this idea. Possibly, therefore, better results may be secured with some concentrations than with others, and there may be hope of something coming from the rational study of the influence of variations of the concentrations of metallic ions in the infected organism.

On the other hand, two things should never be forgotten: first, that the introduction of the minimal dose into human therapeutics in reality makes the assertion of the inefficiency of any substance on any kind of disease very difficult, especially in the case of the more chronic diseases, such as tuberculosis; and secondly, that a catalyst only augments the velocity of reaction and never alters the direction of chemical processes. By introducing a catalyst into a chemical system, whether a simple or complex system such as the organism, we cannot control the final

results of its reactions but only the velocity with which the possible results are obtained. All catalytic treatment therefore implies a profound knowledge of the pathological conditions of the individual organism at the moment of beginning treatment, and it does not seem probable that important progress in clinical treatment will be made in this way before the true nature of the immunization processes in the organism have been cleared up to a larger extent than they are at present.

For this reason I have felt it to be more hopeful to follow the lines of real chemotherapy drawn by Ehrlich and Morgenroth. In the special case of tuberculosis there is, however, one reason more. The results hitherto obtained in the chemical therapy of this disease are, it is true, not very encouraging; but, on the other hand, I have noted that in none of the numerous investigations of the different kinds of chemical therapy of tuberculosis has any attention been paid to some of the most prominent facts in the pathology of the disease—the specific resistance of the bacillus of Koch and the peculiar structure of the tuberculous tissue. I considered, therefore, that an attempt to develop a rational chemotherapy of tuberculosis with special regard to these two facts was still worth making.

#### A. THE CHEMISTRY OF SANOCRYSIN TREATMENT.

It is a well known fact that the toxic effect of a heavy metal on the organism is exerted by the positively charged metallic ion. A chemotherapeutic compound of a heavy metal must therefore never introduce important amounts of free metallic ions into the organism. Hence it follows that the first step in diminishing the organotropy of any compounds of heavy metal is to enclose the metal in a real complex body, of which the stability is sufficient to keep the concentration of metallic ions in watery solution practically equal to 0. Further, it is evident that the complex body in which the metal is enclosed must not itself be poisonous to the organism, as is cyanogen. Finally, the whole complex must have such chemical qualities that the amount of it which does not enter into combination with the parasite is excreted unaltered, or, if decomposed, then without the forming of metallic ions or other bodies poisonous to the organism.

These are the fundamental conditions which make it possible to use a compound of a heavy metal as a chemotherapeutic agent without injuring the organism. To secure a bactericidal effect the substance needs further a specific affinity for the parasite in question. The general principle on which to find such an affinity, when no prominent properties of the parasite suggest a special method, is laid down by Ehrlich and Morgenroth in "the principle of chemical variation." In tuberculosis the whole question, however, is complicated by two peculiarities in its pathology.

1. The specific resistance of the bacillus of Koch is due to its content of fatty substances, whose presence is the principal reason for the so-called acid-fastness of the bacillus and its resistance to antiformin and other generally employed disinfectants. A bactericidal effect of any compound of a heavy metal on tubercle bacilli is, therefore, not to be anticipated, except subject to the condition that the compound is capable of penetrating the fatty system and so carrying the metal into the body of the bacilli.

2. The peculiarity of the tuberculous tissue, which is of importance in chemotherapy, is its poverty in vessels. This means that a chemical compound must diffuse from the blood through the tissue to reach the tubercle bacilli, and the distance through which diffusion must take place grows longer as the tubercle increases in size and develops in calcification. Whether a chemical compound under these conditions reaches the bacilli or not is a question, not only of its more or less pronounced specific affinity, but also of the ratio of its diffusion velocity to the velocity with which it is decomposed in or excreted from the organism. The hope for chemotherapy in tuberculosis is therefore probably intimately connected with the possibility of finding a substance which diffuses very quickly through animal membranes, and which is sufficiently stable in the organism to be kept unaltered in the blood and the lymph for a relatively long time.

These last considerations led to the idea that if a substance is to influence tubercle bacilli in the organism, its bactericidal effect must be carried by a rapidly travelling ion of high stability. As recent investigations (Hamburger, Ege, Gürber, Bunge, Abderhalden) appear to show that negatively charged ions diffuse much more quickly through animal membranes than positive ions, it seemed probable that the ideal chemotherapeutic in tuberculosis would be a negatively charged ion. Hence the fundamental idea in the chemical theory of sanocrysin is to insert the heavy metal into a real complex, which is a rapidly travelling negatively charged ion with sufficient stability to remain unaltered in the body for a relatively long time. The heavy metal carried by the sanocrysin ion is gold, because all previous investigations showed that it exercises a greater influence on tubercle bacilli in culture than any other metal. This quality is, of course, only of importance as a guide. To act as a chemotherapeutic agent the complex ion must possess a specific affinity for the tubercle bacilli, and must be able to carry the gold through the lipid system into their body.

So far I have found the sanocrysin ion to be the body which best fulfils this condition. The chemical constitution of sanocrysin is very probably to be written as follows:

In watery solution it dissociates according to the equation:

Its therapeutic agent is then the complex negatively charged ion  $\text{AuS}_2\text{O}_3$ . This ion has, according to my investigations, the following properties. It—

- (1) Is easily soluble in water (1 gr. in 2 c.cm. water).
- (2) Is a real complex and of great stability. Au is not generated by the usually employed strong reducing agents;  $\text{H}_2\text{SO}_4$ ,  $\text{SO}_2$ ,  $\text{SnCl}_2$ ,  $\text{H}_2\text{C}_2\text{O}_4$ ,  $\text{KI}$  do not affect the substance even at boiling temperature. Dilute hydrochloric acid does not affect it at ordinary temperature.  $\text{H}_2\text{S}$  decomposes the ion yielding gold sulphate. Highly concentrated watery solutions decompose slowly, especially in daylight, developing a yellow colour. Diluted solutions are unaltered in about fourteen days, when kept in a dark room.
- (3) Is rapidly diffusible. The diffusion velocity of  $\text{AuS}_2\text{O}_3$  through animal membranes is about 75 per cent. of the diffusion velocity of  $\text{I}^-$ .
- (4) Remains in the body for four to six days after injection into the blood.
- (5) Is partly decomposed in the organism, evidently yielding metallic gold, and partly excreted principally by the kidneys in complex condition. When the urine contains gold it is not found in ionogenic form.  $\text{H}_2\text{O}_2$  in alkaline solution decomposes the substance at  $100^\circ\text{C}$ . totally into gold and  $\text{Na}_2\text{SO}_4$ .
- (6) Does not precipitate proteins, especially not the proteins of calf or horse serum, at a temperature of  $35^\circ$  to  $40^\circ\text{C}$ .
- (7) Penetrates the lipid system of the tubercle bacilli in a very short time, affecting the acid-fastness very gravely and carrying gold into the body of the bacilli in amounts which after a short time can be shown by microchemical reaction.
- (8) Prevents the growth of tubercle bacilli in culture. On the medium I used, and which contained no peptone, I found the growth-limiting concentration to be 1 in 100,000. This value may, however, probably be altered on media of other composition. Especially it must be kept in mind that all media containing  $\text{H}_2\text{S}$  will decompose the sanocrysin and precipitate the gold as gold sulphate and metallic gold. In such media the growth-preventing concentration will increase; the question of growth-preventing properties is, however, of very small importance in chemotherapy. Dioxydiaminorsenobenzol does not kill spirilli *in vitro* and is yet one of our strongest chemotherapeutic agents.

#### B. PHARMACOLOGY OF SANOCRYSIN: EFFECTS ON THE HEALTHY ORGANISM.

As has been pointed out above, every chemical substance which has an affinity for a parasite may be expected to have some affinity for the cells of the organism. The organotropy of sanocrysin has not been cleared up in all its details, but the principal questions have been so far investigated that we have sufficient material to decide whether we can take the responsibility of injecting it into human beings or not. We know at present the following facts from investigations on calves, rabbits, and monkeys.

**Circulation.**—The intravenous injection of sanocrysin in doses of from 1 to 6 cg. per kilo of body weight does not affect the rhythm or rate of the heart; the blood pressure remains unchanged.

**Red Blood Corpuscles and Haemoglobin.**—Repeated intravenous injections of sanocrysin in doses up to 6 cg. per kilo body weight have no injurious effect on the red blood corpuscles or their haemoglobin.

*Temperature.*—Doses up to 4 eg. per kilo body weight do not affect the body temperature.

*Body Weight.*—Doses up to 4 eg. per kilo body weight do not influence the weight of the individual.

*Liver.*—Doses up to 6 eg. per kilo body weight have never caused any apparent injury to the liver and jaundice has never been observed.

*Kidneys.*—Sanocrysin is excreted principally by the kidneys. If a first dose of 2 eg. per kilo body weight is given it may be followed by slight albuminuria, which disappears within two or three days. If, on the other hand, the first dose does not exceed 1 eg. per kilo body weight, no albuminuria is caused; and subsequent doses of 2 eg. per kilo body weight are tolerated without causing any albuminuria. Generally the dose can be increased gradually up to 6 eg. without causing albuminuria. Thus the kidneys rapidly increase their tolerance to sanocrysin.

*Intestinal Tract.*—The administration of 2 eg. per kilo body weight produces no apparent effect on the intestinal tract. In monkeys 7 eg. have been tolerated without such effect.

*Nervous System.*—Doses up to 6 eg. per kilo body weight do not cause any detectable disturbance of the nervous system in healthy animals.

From these investigations it appears that sanocrysin in doses of from 1 to 4 eg. per kilo of body weight has very little effect on the sound organism. The weak point in the pharmacology of the substance is its action on the kidneys. This action is, however, avoided when the initial dose does not exceed 1 eg. per kilo nor the maximum therapeutical dose 2 eg. per kilo. Most animals endure bigger doses, and clinical experience has shown that the same is true in a large number of human beings.

On the other hand, the effect on the kidneys seems to be quickly reparable. Even with doses up to 6 eg. the albuminuria disappeared in a few days, and we have never found the lesions of the kidneys to develop in calves into chronic nephritis—even after six months' observation.

#### G. IMMUNOBIOLOGICAL PRINCIPLES.

From the preliminary investigations of Mafucci, as well as from researches by many different authors (Prudden and Hedenpyl, Strauss and Gamaleia, Calmette and Bretou, Grancher and Ledoux-Lelard, Ussmann, Kosteuch, Krompecher, Keller, Engelhardt, Baumgarten, and others), we know that killed tubercle bacilli can exercise a local as well as a general injurious effect on the healthy organism. The local effect consists in the formation of abscesses at the site of injection, while when the bacilli are injected into the blood miliary tubercles are produced in different organs. The general effects are emaciation, cachexia, and more or less pronounced intestinal disturbances.

These results lead us to expect that a chemical compound which kills tubercle bacilli in the organism will cause very serious toxæmia when injected into a tuberculous organism.

Further, the splendid investigations of Robert Koch showed that the healthy and the tuberculous organism react quite differently to the injection of killed tubercle bacilli or tuberculin. In the healthy animal the toxic effect is produced only by large doses of killed tubercle bacilli and takes a relatively long time to develop. Even very small doses of killed bacilli or tuberculin often, in tuberculous animals, cause very severe symptoms, which develop in a relatively short time, and are signs of an acute intoxication of the organism. These symptoms are well known to everyone who is acquainted with the so-called specific therapy of tuberculosis. It need only be emphasized here that we meet two different groups of symptoms according to the pathological condition of the organism. The first group is represented by the acute intoxication caused by injection of tuberculin into highly tuberculous guinea-pigs and other small animals in the very acute stage of the disease. As shown by Koch, this "tuberculin shock" generally kills the guinea-pig in six to thirty hours, with very pronounced and very constant pathological changes in different organs.

The other group is represented by the "tuberculin reactions" caused by injection of tuberculin or killed bacilli into tuberculous animals with a more chronic type of the disease. The principal symptom of this group is a rise in temperature, but when large doses of tuberculin are injected other symptoms are produced—namely, pain in the limbs, cough, pronounced faintness, nausea, and often vomiting. In many cases an exanthem similar to the rashes

of measles appears on the neck and chest. Occasionally a slight icterus has been observed.

The injection into a tuberculous organism of a chemical substance which kills tubercle bacilli must therefore be expected to cause more or less pronounced symptoms of intoxication. As a general reaction the tuberculin shock has only been produced in guinea-pigs. Other animals seem to be more resistant. The production of shock in a larger animal might, however, only be a question of the amount of toxins formed in the body. It should therefore be strongly emphasized that to inject a bactericidal substance into a tuberculous organism may involve all the risks of tuberculin shock. At any rate, we must expect to find "tuberculous reactions," often in very pronounced degree.

On the other hand, it is clear that a chemical substance which is not capable of producing tuberculin reactions cannot be expected, when injected into tuberculous organisms not immune from tuberculin, to have any injurious influence on the tubercle bacilli. As almost all the larger (tuberculous) animals react to tuberculin, except in the earliest and latest stages of the disease, a curative effect produced by chemotherapy must always be associated with big reactions, unless we are able to produce total immunity, either active or passive, before the injection of the bactericidal substance.

From these considerations it follows that a substance capable of killing tubercle bacilli in the organism must also produce very severe reactions in the tuberculous organism when injected in doses which have no effect on a healthy animal. Is that true for sanocrysin? It has been mentioned above that this substance, injected intravenously in doses of 2 eg. per kilogram of body weight has no effect on the temperature, the body weight, and the intestinal canal, and does not cause albuminuria when a previous dose of 1 eg. has accustomed the kidneys to excrete the substance.

Experimental researches and the clinical experiences have shown quite uniformly that the tuberculous and the healthy organism react quite differently to this substance. A quarter, and in some cases one-tenth, of the dose, which is without effect on the healthy animal, produces the most severe reactions in the tuberculous organism, and in the experimental work and in clinical observations we have encountered all the different symptoms belonging to the two groups of symptoms observed after the injection of tuberculin into tuberculous animals and human beings.

#### Shock Produced by Sanocrysin.

Very early in my experiments I found that one-third of the sanocrysin dose which is tolerated by the healthy guinea-pig always produces very severe intoxication in the highly tuberculous guinea-pig, and usually kills the animal in sixteen to forty-eight hours. The pathological changes in the organs have always been absolutely identical with those found by Robert Koch in the tuberculous guinea-pig killed by tuberculin; in particular a large hæmorrhagic zone was found surrounding the tuberculous lesions and spreading into the tissue around them.

In further experiments on highly tuberculous animals (goats, calves, monkeys) the same phenomena were observed. In monkeys especially, which are very sensitive to the intoxication, the shock could be made very significant; when the infection is set up by intraperitoneal injection with a small dose of human tubercle bacilli, monkeys develop a chronic tuberculous peritonitis, which does not cause death until after a period of about three months or more. If in the third week after the infection so small a dose as only 2 eg. of sanocrysin per kilogram of body weight were injected intramuscularly in one hind leg, a sero-sanguineous peritonitis develops in six to twenty-four hours, and the animal dies usually within forty-eight hours.

Goats, and calves more especially, though they are more resistant, yet very often die after only one injection of 2 eg. of sanocrysin per kilogram of body weight. In all cases pathological changes were found in the tuberculous organs of the same kind as in the tuberculous guinea-pigs. In calves, which ordinarily do not die until forty-eight

hours after the injection of sanocrysin, the development of the shock was investigated in detail. Ordinarily it begins with albuminuria, which develops into a grave parenchymatous nephritis. Shortly after the appearance of the grave symptoms of nephritis (increasing albuminuria, cylindrical casts and blood corpuscles in the urine) acute myocarditis appears. The third and last stage in the intoxication in animals affected with pulmonary tuberculosis is an extensive oedema of the lungs, which increases until the animals die, with frothy fluid exuding from the mouth and nose. Shortly before death a very significant clinical symptom occurs—namely, a fall in temperature, usually of  $2^{\circ}$  to  $3^{\circ}$  C. In most cases the animal dies at the lowest point in the temperature curve; but in some cases it recovers temporarily, to die one or two days later.

#### *Serotherapy of Sanocrysin Shock.*

Investigation of thirty large tuberculous animals treated with sanocrysin pointed to the fact that the shock mainly occurred during two distinct periods—namely, during the first three weeks after the artificial infection, and during the last weeks before death. As it is well known that the measurable antibodies in the blood are very much diminished, if not totally absent, in these two periods, I came to the conclusion that animals in the more chronic period might contain antibodies which were capable of protecting them from the shock. To test this I injected serum from a calf, affected with chronic tuberculosis for about three months, intravenously into two tuberculous calves suffering from grave shock produced by a sanocrysin injection. The result was striking; these calves recovered clinically in a few hours, and the albuminuria disappeared in twenty-four hours. From this observation I concluded that it might be possible to immunize animals against shock.

As the development of the shock is rapid there will never be time to produce an active immunity in an acute case; the protection against the shock must be by means of a passive immunization—that is, by way of serotherapy. The truth of this idea has been shown by demonstration that it is possible to protect tuberculous animals against the shock and to cure the shock by means of a serum produced by immunization of healthy animals with killed tubercle bacilli.

This serum was first produced in calves by repeated injections of killed tubercle bacilli and tuberculin. At present it is made by injection of defatted, formalin-treated tubercle bacilli, according to Dreyer's principle. By means of this antigen the strength of the serum has been increased, and it has been possible to make it in horses.

With this serum forty tuberculous calves and goats, suffering from albuminuria after sanocrysin injection, have been treated on more than 120 occasions. In all cases where the infection has been reasonable the albuminuria has disappeared, in most cases very quickly, but in some more slowly, and the shock was totally prevented. Only in cases in which the injection has been very much too large (animals infected with more than 7 cc. of virulent tubercle bacilli injected intravenously) the serum has not always been able to prevent the shock. This suggests that study of the serum question may contribute very much to the efficiency of the treatment in the grave cases of very acute progressive disease.

The experiments on calves and monkeys, as well as clinical tests on human beings, have uniformly shown that the serum is capable of curing the shock, when injected intravenously in sufficient doses at the very beginning of the fall in temperature. If, however, the collapse has continued for any considerable time, the serum injection may be followed by temporary recovery, but death ensues from failure of the heart. In clinical treatment it should therefore always be the rule to inject serum at the earliest appearance of the albuminuria, as it is the first sign of impending shock. It is, of course, true that albuminuria is not on every occasion followed by shock, but it is not always possible to decide in which case this will happen and in which it will not. The clinician must be very careful on this point, and not omit the serum treatment in any case before he has acquired sufficient experience to be able to

judge the condition of his patients during the sanocrysin treatment.

As far as I can see, all these investigations prove that sanocrysin in tuberculous animals and human beings can produce an acute intoxication, which does not occur when much larger doses are injected into healthy animals, and that this intoxication can be prevented or cured by means of a serum made by immunization of healthy calves and horses with defatted formalin-treated tubercle bacilli. Consequently it is possible to confer upon tuberculous animals and human beings a specific immunity against the lethal effect of sanocrysin. This is probably the best proof of the bactericidal influence of this substance upon tubercle bacilli.

#### *Reactions of the Tuberculous Organism Immune to the Shock.*

As has been pointed out above, animals with a more chronic tuberculosis very often show a high immunity to shock, and the same is true with certain tuberculous human beings. These animals or patients tolerate the sanocrysin injection without getting any albuminuria or other signs of the shock.

The tuberculous organism, whether naturally immune or made immune by serum, gives very pronounced reactions to sanocrysin, but of another very different type. None of the features of shock appear, but we find instead all the symptoms belonging to the second group mentioned above—the "tuberculous reactions." The most obvious of them are the following: rise in temperature, exanthemata, loss in weight, faintness, and intestinal disturbances. Besides them focal reactions in the infected organs are observed with more or less regularity, as happens with tuberculin injections.

There is no space to consider here all the details of these reactions; they have been investigated to a very large extent by the clinicians, who have proved a striking similarity in all principal points between the experimental and the clinical observations. For details I must refer readers to the preliminary report on results from Danish clinics (Holger Moellgaard, *Chemotherapy of Tuberculosis*, Copenhagen, 1924), and to later publications.

#### *Loss of Reactions during Treatment.*

One important feature of all the reactions mentioned must be emphasized: they all disappear gradually as the clinical signs of the disease disappear. This fact is very interesting, because it is just what might be expected if sanocrysin is really able to cure tuberculous disease. To do this the substance must be able to transform the tuberculous organism from a condition in which it gives a severe reaction into a condition in which it gives no reaction to the substance itself, as is the case with the healthy animal. The fact that this transformation is actually observed brings us nearer to the idea of a real cure of the disease. The cured tuberculous animal tolerates sanocrysin without getting albuminuria, temperature reactions, loss in weight, exanthemata, focal reactions, or intestinal disturbances.

On the other hand, the pathological conditions in tuberculosis are so complicated that the loss of all reactions to sanocrysin is no decisive proof of a real cure. From the animal experiments we already know that the condition of failing reactions to sanocrysin means one of three things:

1. Sterilization until negative result of the guinea-pig test.
2. Total immunity with loss of Pirquet reaction, but without sterilization.
3. Simple failure of reactions because the rest of the bacilli are too protected by fibrous tissue or lime; in these cases the Pirquet reaction persists.

Whether there is a fourth possibility—that of a gold-fastness of the bacilli—we do not know at present. If such a condition exists it seems, however, to be temporary only, but further investigations are urgently needed.

From clinical experience in man we know already the last two conditions. To prove the first is, for valid reasons, beyond the reach of clinical observation at this early stage of our observations. Personally I doubt whether it will ever be possible to prove it clinically.

Before their total disappearance the reactions to sanocrysin are ordinarily delayed until two or three days after injection. The transitory stage between the disappearance of the clinical signs of tuberculosis in the lungs and the definite loss of reactions is marked by "late reactions." This phenomenon is very interesting, because its appearance is in close accordance with the power of sanocrysin to remain for four days in the organism and to diffuse through animal membranes. The late reactions may be explained on the assumption that most of the bacilli have been cleared out, and those remaining are better protected; the substance, therefore, takes longer to reach the bacilli by diffusion.

This observation has a very important bearing on clinical trials. In experiments the late reaction has been found only in the last stages of the cure. Where, however, the bacilli are well protected by fibrous tissue (a condition present in many cases of chronic tuberculosis met with clinically), such reactions are to be expected from the beginning of the treatment. Clinical experience has shown that "late reactions" two to four days after a sanocrysin injection very often occur.

For the clinician it is of great importance to know that even big reactions may occur as late as four days after one sanocrysin injection, because it tells him that if he injects a fresh dose within this interval he may bring upon his patient the risk of a cumulative effect of the liberated toxins. If there are no special indications which make a more intensive treatment necessary the interval between two injections of 2 cc. of sanocrysin per kilo of body weight should never be shorter than four days. For the same reason it is not right to inject a fresh dose of sanocrysin during the temperature reaction produced by a previous injection.

#### D. CURATIVE RESULTS.

The general results of the animal experiments hitherto made may be summarized as follows: The combined sanocrysin-serum treatment has saved the life of even very gravely infected goats, calves, and monkeys, and brought them into a condition of clinical healing. On the other hand, it appears evident from the experiments that a thorough sterilization of the affected organs is very difficult and probably very seldom secured in cases of grave infections. In four lighter cases and in one grave case I have been able to carry the cure through until the guinea-pig test was negative. In all other experiments the guinea-pig test has been positive, though the tuberculosis was reduced to a few calcified tubercles in the lungs and sclerotic processes in the bronchial glands.

In considering the clinical bearing of these observations it must be strongly emphasized that the curative results in the animal experiments have been secured mostly in cases of exudative pneumonic type of tuberculosis of the lungs. I have chosen this type in order to avoid the well known variations of the chronic type, which are very disturbing in experimental work. But by choosing this type I have, strictly speaking, limited the proof of the curative effect of the sanocrysin to exudative pneumonic tuberculosis in the lungs. Further, the results of the guinea-pig test in my experiments suggest that the possibility of achieving sterilization depends to some extent on whether the disease has progressed as far as caseous destruction or not. In the cases where the tests have given negative results the *post-mortem* examination showed no tubercles or only very few. In all cases where a larger amount of bigger tubercles were found, even though they were calcified, the guinea-pig test gave positive results.

It must therefore be expected that the best effect of the sanocrysin-serum treatment in the human subject will be obtained in cases of the exudative pneumonic type. Clinical experience seems already to show that this consideration comprises a true idea, the most striking clinical results having been secured in exudative cases. As, however, our present treatment, inclusive of artificial pneumothorax, fails to give definite results in very many of these cases, the attempt to found a chemotherapy on sanocrysin would not have been in vain, even if it should be limited to such cases.

On the other hand, the experiments have demonstrated that it is possible in a short time to cause typical produc-

tive [*sic*] tuberculosis<sup>1</sup> in its earliest stages to heal up with sclerosis and calcification, and clinical experience has shown that cases of acute extensive miliary tuberculosis of the lungs can be brought into a condition of clinical healing. Even though the effect is greatest in the exudative cases, there might be some good results in the more productive cases also. Besides, clinical tuberculosis, as is well known, very seldom provides a pure case of one type of affection. In most cases there will be found productive and exudative processes together, and the sanocrysin will then have a great mission in checking the exudative progressive processes.

As was to be expected, the extent and gravity of the tuberculous process set a certain limit for the success of the sanocrysin treatment. In experiments on calves and goats this limit has been found with an initial infection exceeding 7 cc. tubercle bacilli per 100 kg. live weight of the cultures I have employed. I have only been able to carry one case with an initial infection of 10 cc. through until clinical healing. In the other cases the cure was inhibited by a rapidly developing cachexia, when big doses of sanocrysin were employed, and in cases of small doses the process could not be stopped: there were too many bacilli. It must, however, be understood that this limit is not decisive but dependent on the virulence of the cultures employed, when the treatment begins at the same time after the date of infection.

Finally, animal experiments have shown that other diseases in the lungs (mixed infections) may render it very difficult to obtain a curative effect with sanocrysin because the other processes themselves progress or protect the tubercle bacilli against the substance by enclosing them in large sclerotic masses of destroyed tissue. This has been observed in goats gravely infected in both lungs with *Strongylus capillaris* as well as with tuberculosis.

#### E. THE FATE OF THE TUBERCLE BACILLI IN THE TISSUE AND THE ALTERATIONS OF THE TUBERCULOUS LESIONS.

In three cases I have examined the lungs of calves after two to four weeks' sanocrysin-serum treatment. In all cases microscopical examination of preparations stained by the Ziehl-Neelsen method showed, particularly in small remaining miliary tubercles and their surroundings, numerous acid-fast granulations mixed with curled acid-fast and grey non-acid-fast bacilli. Amongst them were often found some acid-fast bacilli with normal morphology, and, as a transitory stage between the normal bacilli and the free granules, chains of granulations in the tissue. The granules were almost all intracellular. Probably these phenomena are indicative of the way the bacilli are cleared out of the tissue under the treatment. At any rate, these alterations of the bacilli in the tissue are, in my opinion, very remarkable.

The influence of the treatment on the anatomical lesions in the tuberculous organs may, it will be understood, vary according to whether the disease has been checked before the development of caseous tubercles or not. Where the process has been treated in the pneumonic exudative stage the only residuals of the process found on microscopical examination seem to be obliterated capillaries and small vessels and some infiltrations of the alveolar walls, which, however, are also found in lungs of quite normal calves.

Where real miliary tubercles and bigger caseous tubercles have developed, we have found the same alterations as are ordinarily observed when the tuberculous process heals spontaneously—namely, sclerosis and calcification. The most interesting observation has been that miliary tubercles may be grown through with fibrous tissue and contain a stone-hard piece of lime after four and a half to ten weeks' treatment. Bigger caseous tubercles have often in a very short time (five weeks) become surrounded by thick fibrous walls, and more or less filled with pieces of lime.

These results seem to prove that the sanocrysin treatment really exercises such influence on the bacilli in the tissue and on the tuberculous lesions as might be expected from the clinical observations of its curative influence on the tuberculous processes.

## REGIONAL ANAESTHESIA:

## AN ESTIMATE OF ITS PLACE IN PRACTICE.\*

BY

C. HOPE CARLTON, M.Ch.Oxon, F.R.C.S.Eng.,

SPECIAL STUDENT IN REGIONAL ANAESTHESIA, THE MAYO  
FOUNDATION, ROCHESTER, MINNESOTA, U.S.A.

What follows is based on my personal experience, on the observation of several hundred cases, and on the examination of the records of many more cases in which regional anaesthesia was administered in the Mayo Clinic during November and December, 1924, and January, 1925. No attempt is made to treat the subject systematically and as a whole; for such, the treatises of Labat, Braun, Meeker, Gwathmey, and others may be consulted. It is intended here to describe in essential detail those applications of regional anaesthesia which, beyond reasonable doubt, relieve the patient and assist surgical practice.

*Preparation of the Patient.*

An aperient is administered the night before, followed by a sleeping draught. An enema is given in the morning, and a light meal of tea and toast four hours before going to the operating room. Half an hour before operation, unless a head case, the patient receives from 0.16 to 0.25 grain of morphine, combined in abdominal cases with 0.01 grain of atropine to reduce the liability to nausea. The skin in the area to be injected is treated as for any surgical operation. Preliminary cleansing with benzene and ether is followed by painting with 2 per cent. tincture of iodine. The area is then draped with a single layer of towels, through which the bony landmarks are easily felt. It is an aid to place these towels at definite levels; for example, in a dorsal exposure of the patient, the upper edge of the lower towel should be at the level of the iliac crests, and the lower edge of the upper towel at the level of a selected vertebral spine. If the patient is exposed ventrally, the umbilicus, xiphoid, and pubis are useful levels for the edges of the towels. The lateral towels are best placed at the outer edges of the recti.

*Preparation of Anaesthetic and Instruments.*

Novocain (Metz) was used throughout the present series of cases. The solution was prepared as follows:

Four hundred c.cm. of sterile 0.9 per cent. sodium chloride were brought to the boiling point in a flask previously boiled for fifteen minutes; 75 grains of novocain were added and the whole gently boiled for three minutes, after which the mixture was diluted with freshly boiled sterile sodium chloride solution to 500 c.cm. This gave a 1 per cent. solution. At the last possible moment before injecting, 0.1 per cent. adrenaline was added in the proportion of 10 minims (not drops) to each 100 c.cm. of the novocain solution.

The glass syringe is graduated for 10 c.cm. and holds an additional 3 c.cm. to admit of aspiration.

It has metal ends, of which the proximal screws on, a metal plunger, and an eccentric nozzle with bayonet catch for the needle. To ensure an accurate fit of plunger and needle, the design of Labat, by Ateliers Gentille of Paris or Sharp and Smith of Chicago, was chosen. The needles are of non-corrosive steel, made as long as compatible with their tensile strength, and of varying size. A useful outfit would include five needles of 50 mm., three of 80 mm., three of 100 mm., three of 120 mm., and several 20 mm. dermal wheal needles. Each of these holds a stylette and is itself held in a metal tube container. There is needed also for caudal anaesthesia an 80 mm. steel spinal needle with a stylette, the end of which accurately fits the end of the needle. At the proximal end of the stylette is a slot and button to show where the bevel of the needle and stylette coincide. The cutting end should be refreshed with a carborundum hone before sterilizing. With the left index finger almost over the point of the needle to press it on the bone, and the proximal end between the right finger and thumb, the point is moved not more than 1 cm. back and forth, the needle making an angle with the bone not more than 10 degrees. This results in a long narrow bevel which will pierce the skin with a minimum of trauma and

pain. The needles are sterilized by boiling in water for three minutes with stylettes in place. The syringe is kept in an alcoholic solution of phenol and rinsed with sterile water before using.

## ANAESTHESIA IN THE PELVIC AREA.

There is no area of the body in which regional anaesthesia is of greater value, or easier of application, than in the pelvis. The anaesthetic is applied to the sacral nerves outside the spinal dura mater. The needle is inserted through the hiatus sacralis for caudal anaesthesia, or through the posterior sacral foramina for transsacral anaesthesia. The anaesthetic may be introduced into both hiatus and foramina in the same patient. This may be called sacral anaesthesia. When the fluid is introduced into the hiatus, anaesthesia may be depended on up to and including the third sacral nerve in all cases. Usually it will include also the first and second sacral nerves. If the fluid is introduced into the third and fourth sacral foramina as well, anaesthesia is prolonged. If introduced into the first and second sacral foramina, then the first and second sacral nerves will certainly be affected. For external haemorrhoids, anal tags, fissures, and fistulas, caudal anaesthesia is adequate. For more extensive pelvic operations, such as prostatectomy or rectal excision, complete sacral anaesthesia is necessary. No further discomfort is caused the patient, since there is already some anaesthetic about the sacral foramina as a result of the fluid introduced through the hiatus. Such sacral anaesthesia admits the freest of pelvic manipulation. There are two limitations: the peritoneum remains sensitive to traction, and approach to the pelvis is confined to the perineal route. The pelvic peritoneum, however, lies in the field of anaesthesia, so that low rectal resection can be performed under sacral anaesthesia, with little or no discomfort, by the perineal route. Since an abdominal field-block permits of the suprapubic approach to the prostate, it follows that sacral anaesthesia, together with an abdominal field-block, will allow of the performance of suprapubic prostatectomy. This anaesthesia, indeed, has been found ideal for prostatectomy. There is complete loss of sensation, with rarely the fall in blood pressure associated with spinal anaesthesia, or the respiratory embarrassment met with in inhalation anaesthesia.

*Method.*

The patient lies prone on the operating table with a bolster under the hips to elevate the sacrum and buttocks. The draped towels leave uncovered an area from the first lumbar vertebra to the tip of the coccyx, and about as wide as it is long. A small wheal is raised one fingerbreadth above the upper end of the natal furrow. A 50 mm. needle is inserted through the wheal at an angle of about 60 degrees. After it has been passed about 3 or 4 mm. it will be felt to pierce a membrano (the posterior sacro-coccygeal ligament). There is a momentary resistance; then the needle goes quickly for 1 mm. and comes to a stop as it hits the sacral body on the floor of the hiatus sacralis. If it strikes a bone without that preliminary feeling of piercing a membrane and traversing a space, it must be withdrawn until the point is just below the skin and another attempt made. As soon as the point is in the sacral canal, 5 c.cm. of 1 per cent. novocain (in rectal cases 10 c.cm.) are slowly injected. Should subcutaneous oedema occur, the sacro-coccygeal ligament has not yet been pierced, and these steps must be retraced. As soon as the manoeuvre is completed, the original needle is replaced by a steel spinal needle with stylette. If it sticks, it is rotated through 180 degrees. If it is felt grating against bone, it is moved forward or back until the grating sensation disappears. At the end of the manoeuvre, three-fourths of the needle should be in the canal, and there should be no grating sensation on moving it forward or back 1 mm. A grating sensation means that the point is near bone, and is probably in a vein. If, on aspiration, blood or cerebro-spinal fluid enters the syringe, the stylette must be replaced and the needle moved slightly forward or back until subsequent aspiration is negative. The aim is to bring the point of the needle into the centre of the sacral lumen away from the bony walls and outside the dura.

\* Work done in the Section on Regional Anaesthesia, Mayo Clinic, under the direction of Dr. J. S. Lundy. Submitted for publication January 12th, 1925.

When the needle is clearly in place, the anaesthetic is slowly injected up to 45 c.cm. if the patient weighs less than 154 lb. (70 kg.), or 55 c.cm. if he weighs 168 lb. (76 kg.). A reaction may take the form of pallor, sweating, nausea, or a rise of the pulse above 120 or a fall below 60, and demands a pause until it subsides. Anaesthesia of the perineum commences in from five to twenty minutes, and the field gradually increases. If it has not begun in half an hour, the suspicion will arise that the needle has not reached the caudal canal. There should be a well marked deepening of respiration, usually apparent after only 1 or 2 c.cm. has been injected. The absence of this deepened respiration will excite strong suspicion that the needle is not in the canal, and it may be well, then and there, to withdraw and reinsert it.

This is for simple caudal anaesthesia. If complete sacral anaesthesia is desired, caudal anaesthesia is first administered, but only 30 or 35 c.cm. are injected. The needle with stylette inserted is then left *in situ*. After a pause of several minutes to allow caudal anaesthesia to extend, transsacral is begun. The posterior superior iliac spine is the starting point. In a fat person there will be a dimple here, in a thin person a bony prominence. At a point 1 cm. internal to this and 0.5 cm. below it a wheal is raised with the small dermal needle. This is over the site of the second sacral foramen. Labat places this foramen 1 cm. below the interspinous line, while Meeker and Scholl find it 2.5 cm. medial to the spine and 1 cm. below. The line from this point to another 1 cm. external to the point of entry of the caudal needle (still left *in situ*) marks the row of foramina. Both Labat and Meeker insist that the sacral cornu offers the most constant relationship to the lower end of this line. The line is divided into three equal parts, and a dermal wheal placed at the juncture of the first and second, and second and third parts, marking the sites of the third and fourth sacral foramina respectively. An 80 mm. needle, or in a thin person a 50 mm. needle, may be inserted at right angles to the skin, through each of the above three wheals, into the corresponding second, third, and fourth posterior sacral foramina. When it enters, if in the exact axis of the foramen, there is a feeling of absence of resistance. If this sensation is not experienced, another attempt must be made. If failure attends the third trial, another foramen should be tried. Each one successfully located assists the determination of the others. The position of the first sacral foramen is determined by producing upward a line connecting the three wheals already made, and taking on it a point as far above the second foramen as this foramen is above the third. The foramina of the other side are next injected in the same way. Into each of the first sacral foramina should be injected 5 c.cm. of the 1 per cent. novocain solution; into each of the second, 4 c.cm.; into each of the third, 3 c.cm.; and into each of the fourth, 2 c.cm. It is best to start injecting the fourth sacral foramen first, then the third and second, since the anaesthesia due to the caudal injection will act at the lower end of the sacrum sooner than at the upper. In this way many patients go through the transsacral injections without pain. If there is pain on raising the transsacral wheals, a little delay will allow the caudal injection to act further. At the close of the transsacral injection, if the patient shows no reaction to the novocain and adrenaline, a further 10 or 20 c.cm. may be injected through the caudal needle, which remains in place throughout the administration. In a few minutes the patient's readiness for operation will be shown by insensibility to a pin prick in the median line of the perineum, and loss of the anal sphincter reflex.

#### Nomenclature.

The cases classified as "good" were all that could reasonably be desired. Those classified as "poor" were failures, and supplementary anaesthesia was required. In those classified as "fair" anaesthesia was adequate, but in some respect lacked reasonable perfection. Those classified as "intended combined" included mostly cases in which patients were nervous and the desirability of a little comforting anaesthetic at some stage had been anticipated. The class "necessarily combined" comprised not only cases

in which regional anaesthesia failed, but those in which, for a variety of reasons, such as the discomfort of the table, failure of the patient's co-operation, or unexpected enlargement of the field of operation, eventually required a general anaesthetic.

There were 312 cases in which the anaesthetic was given. The results in 261 (83.7 per cent.) were good; in 25 (8 per cent.) poor; in 11 (3.5 per cent.) fair; in 5 (1.6 per cent.) "intended combined"; in 10 (3.2 per cent.) "necessarily combined"; and in 22 (7 per cent.) there were reactions.

#### SACRAL ANAESTHESIA COMBINED WITH ABDOMINAL FIELD-BLOCK.

Sacral anaesthesia renders the perineum insensitive, but is obviously inadequate if the pelvis is to be reached through the abdominal wall, as is the case in a suprapubic prostatectomy. In this case an abdominal field-block is added as soon as the complete sacral anaesthesia has been induced. The patient is turned over on his back and a dermal wheal raised at the outer border of each rectus, half-way between the umbilicus and the symphysis. Through one of these wheals there is inserted an 80 mm. needle with syringe attached, containing 0.5 per cent. novocain with 10 minims of adrenalin to each 100 c.cm. It is carried, immediately below the skin, to a point just below the umbilicus, and a dermal wheal raised from underneath the skin. It is now withdrawn so that the point lies just under the skin where first introduced, and reinserted in the same direction as before, but at an angle to the skin of 30 degrees. No solution need be injected during the movement of reinsertion. It will be felt to pierce the anterior layer of the rectus sheath, and at this point 3 c.cm. are injected between the layers of the rectus sheath. The terminal branches of the tenth, eleventh, and twelfth dorsal and first lumbar nerves lie in this region. The needle is again drawn back and redirected forward, this time at an angle of 60 degrees to the skin, and another 3 or 4 c.cm. introduced after the needle is felt to pierce the anterior rectus sheath. The manoeuvre is repeated at an angle of 80 degrees, by which time the syringe will be empty. In just the same way a syringe of saline is injected from the same wheal toward the superior pubic ramus. A repetition of these injections on the other side blocks off a gable-shaped space through which entry into the bladder is made. Lastly, a 50 mm. needle is introduced just behind and to one side of the symphysis, until it is felt to impinge on the pubic bone. It is slightly withdrawn and redirected downward behind the pubis into the cave of Retzius, where 10 c.cm. are injected on each side. By this time anaesthesia of the gable-shaped space should be complete. If not, reinforcing injections may be given in the same areas.

There were 134 cases in which the anaesthetic was given. The results in 118 (88.1 per cent.) were good; in 5 (3.7 per cent.) poor; in 8 (6 per cent.) fair; in 2 (1.5 per cent.) "intended combined"; in 1 (0.75 per cent.) "necessarily combined"; and in 19 (14.2 per cent.) there were reactions.

#### REGIONAL ANAESTHESIA OF THE NECK.

Its chief application in this area is in thyroid operations, but it is applied with equal success in block dissection of glands, excision of a thyro-glossal duct, or, as in one case in the present series, cervical sympathectomy for angina pectoris. The object is to bathe the cervical plexus in anaesthetic. The head being turned to one side, a dermal wheal is raised just below the mastoid and another over the cervical transverse processes, at the level of the superior cornu of the thyroid cartilage. Through the first wheal a 50 mm. needle is introduced, and directed medially, slightly downward and slightly backward. The course of the needle can be visualized more clearly if the tip of the left forefinger is placed on the third or fourth cervical transverse process, and held parallel to the direction decided on. When the needle is felt to touch the tip of the second cervical transverse process, it will be found that it slides off the tip readily in any direction. With it in contact with the tip, 10 c.cm. of 1 per cent. novocain and adrenaline are injected. Similarly a 50 mm. needle is introduced at the level of the

superior thyroid cornu over the fourth cervical transverse process, and another 10 c.cm. introduced. It is important to direct the needle downward so that it hits the transverse process in an oblique direction. If it is directed transversely there is a danger of wounding the vertebral artery or spinal dura, as Mecker pointed out. The head is turned to the other side, and two injections of 10 c.cm. given as before. The preceding constitutes a deep bilateral cervical block. An 80 mm. needle is now introduced through the wheal below the mastoid, pushed subcutaneously along the posterior border of the sterno-mastoid muscle, and 10 c.cm. of 0.5 per cent. novocain injected along its middle third. This blocks those nerves that become superficial at that point—namely, the great auricular, the small occipital, and the transverse cervical. The anaesthesia induced is almost instantaneous, and lasts two or two and a half hours. No adrenaline is added to the novocain solution if the condition is a toxic goitre.

There were 106 cases in which cervical anaesthesia was induced. The results in 83 (78.3 per cent.) were good; in 6 (5.7 per cent.) poor; in 10 (9.4 per cent.) fair. In 2 cases (1.9 per cent.) the anaesthetic was "intended combined"; in 5 (4.7 per cent.) "necessarily combined"; in 5 (4.7 per cent.) there were reactions.

#### INGUINAL HERNIA.

After complete reduction of the hernia, a wheal is raised in a line from the anterior superior spine to the umbilicus, at a distance of three fingerbreadths from the anterior superior spine. A 50 mm. needle is inserted toward the umbilicus subcutaneously. When it has been introduced almost its entire length a wheal is raised, 0.5 per cent. novocain and adrenaline being used. The needle is now withdrawn to the first wheal, and pushed forward at an angle of 30 degrees to the skin. At the moment when it is felt to pierce the anterior rectus sheath, 2 c.cm. are injected. The manoeuvre is repeated at angles of 60, 75, and 90 degrees to the skin. The 50 mm. needle is now completely withdrawn, the syringe refilled and reinserted through the wheal previously raised at the extremity of the needle's first subcutaneous insertion. Through this wheal solution is injected just as before, under the anterior rectus sheath as far as the umbilicus. The needle is again completely withdrawn and reinserted through the first wheal. This time injections are made toward the anterior superior spine, after each 2 or 3 c.cm. injection, increasing the angle the needle makes with the skin, until finally it is at right angles to it. Each injection of 2 or 3 c.cm. is made after the point is felt to pierce the external oblique aponeurosis. As a result the ilio-hypogastric and ilio-inguinal nerves will be completely blocked. A wheal is now raised over the superficial abdominal ring, at about the point where its pillars meet. The cord being raised from its bed is injected with a 50 mm. needle inserted through the wheal, 10 c.cm. of 0.5 per cent. novocain being used. The cord will be felt to swell as a result. Lastly, the 50 mm. needle is reinserted through this wheal between the cord and median line, and 10 c.cm. of novocain injected deep into the cord at its emergence from the superficial abdominal ring. In from five to fifteen minutes there is a complete anaesthesia of the surgical field, excepting the neck of the sac, and a duration of the anaesthesia of one hour may be expected. The neck of the sac is injected when the external oblique aponeurosis has been divided. It is quite possible to inject it before operation, but not without unnecessary risk.

There were 38 cases of inguinal hernia. The results in 27 (71.1 per cent.) were good; in 3 (7.9 per cent.) poor; in 3 (7.9 per cent.) fair; in 1 (2.6 per cent.) "intended combined"; and in 4 (10.5 per cent.) "necessarily combined."

#### LAMINECTOMY.

Regional anaesthesia is of great value in this operation. The position of the patient renders the administration of a general anaesthetic difficult. The operation is usually a lengthy one and the patient a poor subject for such prolonged inhalation anaesthesia. Under regional paravertebral anaesthesia the shock, as measured by blood pressure

and pulse, is slight. In the Mayo Clinic the results with regional anaesthesia have been better than with nitrous oxide or ether. The patient lies prone with the table angulated at his waist, the apex of the angle pointing upwards. His head rests on a horseshoe rest, through which he looks towards the floor. If laminectomy of the seventh dorsal vertebra were to be performed, paravertebral anaesthesia would be induced from the third to the tenth dorsal spine. A dermal wheal is raised 3 cm. to the right of the third spine, and an 80 mm. needle introduced at right angles to the skin. The resistance it encounters is the transverse process of the fourth dorsal vertebra. It is now withdrawn a little and pointed upward until it has passed the transverse process a distance of 1 cm. It will now touch the third dorsal nerve, and paraesthesia at this stage, while not sought intentionally, means later deep anaesthesia. An injection of 4 c.cm. of 1 per cent. novocain and adrenaline is made at this point. The manoeuvre is repeated on the other side of the third spine. In the same way each pair of dorsal nerves is injected, down to the tenth. It is often necessary to wait forty-five minutes before anaesthesia is complete. The process is hastened, and in unfavourable cases made more successful, by infiltrating the post-vertebral muscles with 0.5 per cent. novocain. Experience has shown that infiltration of these muscles alone is often unsuccessful. The area is tendinous and the solution does not run. A combination of paravertebral anaesthesia followed by infiltration shows far better results than either method used alone. As much as 200 c.cm. of 1 per cent. novocain with 100 c.cm. of the 0.5 per cent. solution may be given. In this, as in all regional anaesthetics, the ideal amount of anaesthetic is that which produces anaesthesia without a reaction. If the laminectomy is in the cervical region, then the nerves are best reached by the technique described for bilateral deep cervical block. If the laminectomy is in the sacral region, then the method employed is as detailed under the heading of sacral anaesthesia.

There are 25 cases in which regional anaesthesia in laminectomy was induced. The results in 17 were good; in 4 poor; in 2 fair; in 2 the anaesthesia was "necessarily combined"; 1 showed reaction.

#### CRANIAL EXPLORATIONS.

When craniotomy through the occipital bone is to be performed, a lateral deep cervical block is followed by a superficial cervical block at the posterior border of the sterno-mastoid, just as described for operations on the thyroid, except that 1 per cent. novocain is used for the superficial block. If anaesthesia does not develop quickly and completely, the neck is next infiltrated from the external occipital protuberance downward to the vertebra prominens, and the scalp along the superior curved line of the occiput, out to each mastoid. It is essential to infiltrate thoroughly, for not only does fluid run badly in the thick post-vertebral musculature, but the great occipital nerve at its origin as the posterior primary division of the second cervical nerve lies nearer to the median line than to the transverse process of the axis, and may be missed in the lateral deep cervical block, in which the pools of novocain are deposited at the tips of the transverse processes on the floor of the posterior triangle. From these pools the posterior primary division of the second cervical nerve is shielded by the complexus and splenius. The above technique gives an insensitive and bloodless field for the usual crossbow incision.

There were 4 cases in which regional anaesthesia was induced for posterior craniotomy. The results in 3 (75 per cent.) were good, and in 1 (25 per cent.) poor.

#### REGIONAL ANAESTHESIA IN THE ABDOMEN.

Little need be said on this subject. The question of the path of pain from abdominal viscera is not settled. Labat's technique is based on the theory that the splanchnic nerves provide the greater part of the route; Mecker has expressed himself very emphatically in disagreement. Moreover, that degree of success has not been attained with abdominal anaesthesia which would entitle it to a place among those

manœuvres which have been shown, beyond reasonable doubt, to be of real value. Discredit can only be brought on a rational method of anaesthesia by its too ardent application to a region to which it is very questionably suited.

A modification of Labat's method was used in 32 cases, with good results in 11. Of these, 4 were partial gastrectomies, 3 gastro-enterostomies, and 1 a cholecystectomy. It is impossible to be sure, however, just how much of the result was due to the anaesthesia of the abdominal sympathetic nerves, which Labat's method induces.

The most important result of regional anaesthesia is demonstrated rather by experience than figures. It is that in almost all cases the patient is the better for his regional anaesthetic, and even if inhalation anaesthesia is also needed, the patient is held with a minimum of nitrous oxide or ethylene often sufficient only to abolish consciousness.

#### REACTIONS TO REGIONAL ANAESTHESIA.

These are easily induced unless strict watch is kept on the patient and the various signs noted. It was the rule in all the cases of the present series for a nurse to sit at the patient's head and record the pulse. In head, spinal cord, and abdominal cases she also took the blood pressure. All these were recorded on a sheet of paper which the administrator could see and so avoid alarming the patient by verbal inquiries. The nurse also engaged the patient in conversation and withdrew his attention from the manipulations.

A reaction may be due either to the adrenaline injected or to the novocain, or both. An adrenaline reaction is early, a novocain reaction late. The elements of an adrenaline reaction in the order of their appearance are: (1) increased respiration, (2) rapid pulse, (3) palpitation, (4) apprehensive excitement, (5) tremor, (6) sweating, (7) dyspnoea, and (8) precordial pain. The last two, unlike the others, are late in onset. Any three of the first six constitute a marked reaction; the last two are happily as rare as they are serious. The elements of a novocain reaction are those of spinal anaesthesia: slow pulse, fall in blood pressure, pallor, cyanosis, nausea, and vomiting.

The treatment for either type of reaction is that of prevention. Safety is ensured by slow injection and cessation as soon as the reaction appears. The effect wears off in a few minutes. It is not cumulative and injection may proceed after an interval. In the event of a severe adrenaline reaction, oxygen containing 5 per cent. of carbon dioxide is given. This relieves the air hunger and anginal pain. More than 30 minims of adrenaline should never be given to one patient. There was only one severe adrenaline reaction in the present series. That was in the case of a patient who was afterwards found to have a family history of capillary atonicity. Both blood pressure and pulse rate were abnormally low, and his type would now be considered unsuitable for regional anaesthesia.

An ampoule containing 3 grains of caffeine, 7 grains of sodium benzoate, and 0.025 grain of strychnine should be in readiness in the event of a severe novocain reaction. For severe cases of pallor, nausea, and slow pulse, from 5 to 10 minims of adrenaline are injected.

A certain measure of success may be attained by practice of the technical methods herein detailed. To improve on that and to reduce failure to a minimum, careful study of the anatomy of the region is essential. It is necessary to visualize the field in perspective, and to be prepared for those variations from normal topography and relations which are not to be dealt with by rule of thumb.

## NODAL FEVER.

(ERYTHEMA NODOSUM, ERYTHEMA MULTIFORME.)

BY

ALFRED AUSTIN LENDON, M.D. LOND.,  
ADELAIDE, SOUTH AUSTRALIA.

#### PRELIMINARY.

In 1905 I published a book which bore the title *Nodal Fever*; quite recently Dr. G. F. Walker of Leeds has asked for my present views on this subject, and I will here sum up the results of further observations made during the past two decades. With respect to my *parvum opus* I may mention that, although the criticisms were very complimentary and friendly, the general verdict was the Scottish one of "Not proven."

Briefly stated, my contention was that erythema nodosum is not merely an affection of the skin, but an acute specific fever, met with, and best studied, in ordinary general practice. Evidence was adduced to show that it had a distinct prodromal stage, a stage of eruption, and a period of convalescence; that relapses occurred, and that second attacks had been noticed after an interval of several years. The theory advocated by Dr. (afterwards Sir) Stephen Mackenzie nearly forty years ago, that it is a manifestation of rheumatism, was combated; an explanation of the arthritic symptoms was suggested; and Trousseau's dictum that erythema nodosum is a distinct disease from erythema papulatum was disputed. Finally, I ventured to rename the disease "nodal fever" (*febris nodosa*).

My attention was first directed to this complaint when I graduated in 1879. I was attending at the time a brother, aged 16, whose attack as regards the copiousness of the rash, the degree of the accompanying pyrexia, and the prolongation of convalescence, was as severe as any I have ever seen since; it was something very different from the mild cases I had observed in hospital out-patient practice. I settled in Adelaide in 1883, and during the next seven years met with thirteen more cases. In 1885 I was struck by the coincidence of two cases of erythema nodosum occurring in the same household at the same time, but did not regard it as more than a coincidence. In the following year I had a child, aged 4 years, under my care for several days with a mild feverish attack, and had suspected typhoid fever because of its prevalence at that time; when it turned out to be erythema nodosum, the resemblance of this prolonged period of malaise and pyrexia to the ordinary prodromal stage of many of the acute specific fevers immediately struck me, and the chain of evidence seemed fairly complete. These observations were confirmed in subsequent cases, and in 1890 I wrote a paper entitled "Erythema nodosum, an acute specific fever." The volume *Nodal Fever*, based upon 63 cases, appeared fifteen years later, and was merely an elaboration of my former paper.

In this present communication it is proposed to deal with the subject by showing the general resemblance the symptoms and course of nodal fever bear to other acute specific fevers, by bringing forward fresh evidence pointing to its infectious nature, and by discussing its suggested relationship to other diseases, and the views thereon of other writers.

#### STATISTICS.

The first point to which I would draw attention is the age incidence (excluding cases seen in the Children's Hospital); there were—

Under 10 years ...	...	...	...	...	13
Over 10 and under 20 years ...	...	...	...	...	34
" 20 " 30 " ...	...	...	...	...	30
" 30 " 40 " ...	...	...	...	...	13
" 40 " 50 " ...	...	...	...	...	3
" 50 " 60 " ...	...	...	...	...	2
" 60 years ...	...	...	...	...	1
					96

Roughly speaking, 94 per cent. were under the age of 40 years and 6 per cent. over that age. If we accept 14 years as the average age of puberty in both sexes, and

48 as the approximate date of the climacteric in woman, we find the cases grouped as follows:

Under the age of puberty...	...	...	27
Between puberty and the climacteric	...	...	66
After the climacteric	...	...	3
			96

The youngest patient was 2½ years of age, the oldest was 69.

The influence of sex combined with age is interesting: taking all cases I find—

Under the age of puberty, 18 males, 17 females.	
Over " " 4 " 85 "	
22 males, 102 females = 124.	

The influence of season is very slight.

In the first quarter of the year there were	...	29
" second " " "	...	25
" third " " "	...	30
" fourth " " "	...	34
		118

As regards social state, of those who had attained their majority 38 were single and 18 married. Of 46 adult women the majority were engaged in domestic occupations, but 7 were hospital nurses, and 7 were school teachers, whilst one man and one girl were medical students, and another male was a teacher.

#### SYMPTOMS AND COURSE.

Instead of describing a series of individual cases I shall attempt to draw a composite picture of the complaint, dealing separately with the prodromal, the eruptive, and the convalescent stages. I must premise, however, that cases are met with of varying degrees of severity as regards the general symptoms and the extent of the eruption, as well as of the accompanying pyrexia.

#### Prodromal Stage.

It is not unusual for medical advice to be sought in this stage, when one may meet with most of the ordinary symptoms comprised under the term "malaise," such as headache, shivers, and temperatures ranging as high as 103°; pains in the limbs and joints, stiffness, or a tired feeling as though the limbs were of no use; one patient felt as if she had walked miles. In about 16 per cent. of cases a sore throat is mentioned as an early symptom, but the objective signs in the throat are very slight; at other times there is a complaint of naso-pharyngeal or tracheo-bronchial catarrh; more rarely disturbances of the alimentary canal attract attention. A correct diagnosis at this stage is seldom possible, unless amongst the other symptoms ocular phlyctenulae are noticed; in two such instances? I did prophesy that erythema nodosum would appear, and my prophecy turned out to be correct; on one or two other occasions, even without the presence of this valuable sign, I have suggested nodal fever as a possible diagnosis when no adequate explanation could be found for the prolonged high temperature, and I have been justified by the event. It will illustrate better, I think, the puzzling nature of the prodromal symptoms if I enumerate some of the various suspicions that have been aroused—rheumatic fever, enteric fever, influenza, tuberculous meningitis, hepatitis; these are some of the "shots" at diagnosis made, not by the patient's friends, but by the medical attendant.

The duration of this prodromal stage when well marked, as it was in a third of my second series of cases, appears to average about twelve days, and its extreme limits to range from seven to seventeen days, as far as I can judge. This corresponds very closely with my previous estimate in 1904. A very distinct feature of the prodromal stage is an exacerbation of the symptoms on the third or fourth day preceding the appearance of the rash; this was noticeable in 40 per cent. of my second series. The incubation period, moreover, is occasionally preceded by a considerable period of vague ill health, extending over some weeks or even months, and demanding treatment. The only inference one could venture to draw is that debility, attended with dyspepsia and anaemia, may possibly render the sufferer more vulnerable to an attack of nodal fever; on the other hand, other patients seem to have contracted it when in robust general health.

#### Stage of Eruption.

The question of diagnosis is seldom likely to occur in this stage. The individual spots of erythema nodosum on the shins are easily recognized, and I have been careful to exclude cases of erythema papulatum or erythema multiforme which failed to show at least one typical node on the legs. In a patient seen with Sir Joseph Verco in 1917, where no erythema nodosum or phlyctenulae could be found, there was an abundant rash of the appearance of erythema papulatum and erythema tuberculatum, together with diffuse blotches several square inches in area, but in this case an explanation was found in the fact that the patient was taking potassium bromide for epilepsy; the rash disappeared as soon as the drug was discontinued.

With respect to the appearance of the rash, I may say generally that the characteristic nodes, oval in shape, with their long axes more or less parallel to the limbs, and seldom or never transverse, are mainly seen on the legs. They used to be described as situated chiefly along the shins, but they have no special affinity for subcutaneous bony surfaces, and they may be seen just as much over the rest of the legs. To a less extent this oval shape may be noticed in nodes on the forearm, but elsewhere, round the knees for instance, the skin lesions are generally circular and may range from papules the size of peas to blotches two or three inches in diameter. Many of these spots seen apart from a genuine case of erythema nodosum would be described as erythema papulatum or erythema tuberculatum. I wish to stress this point because, whilst erythema nodosum may predominate, or appear alone, in a given case, the eruption in severe cases is usually a mixed one, and the rarer, though not very uncommon, appearance also of erythema iris, or erythema gyratum, establishes definitely, in my opinion, the multiform character of the nodal fever rash.

The manner in which these spots appear and fade into bruise-like swellings, lasting sometimes for five or six weeks, or even, faintly, for two or three months, need not be described, as it is so familiar; but I may emphasize the fact that the pain and tenderness associated with the spots may persist also for a long time, and that the lumps may be felt long after all colour has faded, whilst the pain and the purple tint may be revived by hanging down the limbs some time after these symptoms had apparently disappeared in the convalescent stage. I do not propose to dwell upon the appearance of the spots elsewhere than on the limbs, but the body, the face, and neck may all be attacked.

The duration of the eruption varies from a few days to some weeks. Besides the fading bruises, a crinkled skin and some desquamation may be noticed, but never suppuration or ulceration, though pustular spots of staphylococcal origin are sometimes accidentally associated. The spots may appear in relays, so that the eruption may be seen in all stages at the same time; or fresh spots may appear when the patient is convalescing, with intervals of from twelve to twenty-five days between the two crops; one lady reported from South Africa<sup>2</sup> that fresh spots had been constantly recurring for nearly a year.

As regards the general symptoms of the eruptive stage, one need only say that they are such as are usually associated with fever and the accompanying toxæmia, and that whilst usually they preserve some ratio of severity to the copiousness of the rash, they often seem less severe than during the prodromal stage.

Two special symptoms should be mentioned. One is somewhat rare, and I have termed it "Verco's sign," as it was first pointed out to me by Sir Joseph Verco in 1892.<sup>4</sup> It consists of subungual striae or dots of hæmorrhage, and may be seen both on the hands and the feet; in my second series of cases I met with it five times—that is, about once in twelve cases. The other symptom is much more common, and consists of one or more phlyctenulae; they are seen on the ocular conjunctiva near the margin of the cornea like tiny spots, or pimples, with a leash of blood vessels like a comet's tail spreading out towards the periphery of the eyeball; generally they are seated over the insertions of the inner or outer recti, but similar spots may be seen on the palpebral conjunctiva near the tarsal edge. It has, as I have already mentioned, a diagnostic importance in the prodromal stage; from its frequency—it occurred in 40 per

cent. of my cases—it establishes itself as an integral part of the disease, and in my opinion is undoubtedly the manifestation of the rash on a mucous membrane. I have not seen a similar thing in the nose or mouth, but in a fatal case of erythema papulatum which I reported<sup>3</sup> there were spots of superficial ulceration in the mouth. If, then, lesions appear on the visible mucous membranes as well as upon the skin, it is not, I think, a far-fetched idea to suggest that the pain complained of in the joints in both the prodromal and the eruptive stages may be due to a "node" developing on synovial surfaces. Here I may mention a piece of evidence that true skin is not an essential basis for the appearance of nodes; for I have seen them on a wide scar over the knee where no true skin tissue appeared to be left. In three or four cases only the glands of the neck have been noticed to be enlarged.

#### *Stage of Convalescence.*

In this stage the chief features are the marked depression and debility, whilst a few have complained of "rheumatism" subsequently. In one case weakness of the limbs persisted for which massage was necessary some eight months after the illness; in an elderly lady the saphenous veins in both legs became plugged.

#### SECOND ATTACKS.

I have recorded<sup>6</sup> four cases of second attacks, and now I can add five more. The interval between the two attacks ranged from one to sixteen years, but the average was almost five years. One patient, a hospital nurse, had three definite attacks within two years. Two other instances of erythema nodosum were followed at intervals of twelve and eighteen years respectively by attacks of erythema papulatum in which no definite spot was discovered which by itself could be called erythema nodosum.

#### ULTIMATE HISTORY OF PATIENTS.

Amongst those who have since died one succumbed to an appendix operation, another died at 75 of apoplexy, and a third at 82 of mitral disease. Morbus coxae, pulmonary tuberculosis, tuberculous meningitis each claimed one victim, and another case succumbed to erythema papulatum. Of the rest, one was operated upon for exophthalmic goitre and one became insane (her mother and sister had committed suicide); in one girl, whose brother was invalided home from the war with phthisis, there is a suspicion of apical tuberculosis; two other patients are liable to a vague sort of rheumatism unattended with fever.

#### THE EVIDENCE OF INFECTION.

I have previously reported<sup>7</sup> several examples of apparent infection conveyed from one patient to another, and now, with my additional cases, I have collected altogether ten such instances. In five of these two children in one family have been seen with the eruption coming out at intervals of from one to nine days, with an average of four days; such cases might be explained by the suggestion of a possible family predisposition, or of exposure to the same exciting cause at about the same time. Family predisposition cannot, in my opinion, be entirely ignored, because in one family I have notes of five grown-up young women contracting the disease at intervals of from one to seven years; four of them were sisters and the fifth a first cousin. Here the further question of a possible "carrier" comes in, and the fact of a patient being a carrier might explain the relapses and second attacks to which I have drawn attention; one of the sisters just mentioned had a second attack. As another instance of such possible family predisposition, or of "carrying" the germ, there is the case of Mrs. A., who had erythema nodosum as a girl of 16 soon after measles, and whose younger sister contracted both diseases almost at the same time; sixteen years later (1909) Mrs. A. had nodal fever again, and her two daughters, aged 14 and 12 years respectively, had it simultaneously in 1921. In another instance a mother was ill with nodal fever and confined to an upstairs room, whilst her grown-up son was laid up with a bubo on the ground floor; when sufficiently well the mother used to come downstairs and sit with her son; he exhibited the rash within a few days. A young woman, a domestic servant, was admitted into the Adelaide

Hospital with the complaint on March 15th; a sister was admitted on March 29th; she had temporarily filled her sister's situation, though she had not slept in the same bed. - Apart from relatives, however, I have two instances that are quite striking. No case of nodal fever had been treated in the wards of the Adelaide Children's Hospital for eighteen months until May, 1889, when L. H. and H. D. were admitted on the 9th and 13th respectively. T. H. (no relation of L. H.) was admitted for other reasons on May 4th, and on June 10th he exhibited the rash. In 1909 a young girl was convalescent in the Adelaide Hospital from typhoid; she developed nodal fever, and two of the nurses in attendance on her contracted it, their incubation period being at least eight days.

Of epidemics of nodal fever I have had no personal experience. Six cases were noticed almost simultaneously at an outlying port in South Australia about thirty years ago. Besides the instances quoted by Dr. Odery Symes,<sup>8</sup> there is a legend of an outbreak on board a training ship just before the holidays commenced; several cadets, who had apparently escaped infection, had definite attacks after reaching home; this used to be quoted, I am informed,<sup>9</sup> by Dr. Lees. Moses quotes<sup>10</sup> an epidemic which occurred in Bosnia in 1857, and Wiborg<sup>11</sup> describes one in Norway in 1921-22, when he saw 30 cases in ten months, 18 of which occurred in December.

#### THE RELATIONSHIP TO OTHER DISEASES.

##### *Other Forms of Erythema.*

I should not, perhaps, have alluded once more to this branch of the subject were it not that I notice that Dr. Odery Symes,<sup>8</sup> in his last able contribution, has not fully made up his mind. Personally I had no doubt in 1890 that although Troussseau in his classic lectures<sup>12</sup> sought to distinguish between erythema nodosum and erythema papulatum, anyone reading his cases carefully must come to the conclusion that the difference was in degree, but not in kind, and that in fact he had unwittingly established their identity. In two severe instances of erythema papulatum occurring in my practice the patients had suffered from erythema nodosum many years previously, whilst associated with undoubted erythema nodosum I have seen at times not only erythema papulatum but every other variety that has been described—erythema tuberculatum, erythema iris, erythema gyratum. Again, in the few cases in which I could not demonstrate typical nodes on the legs, the same prodromata, the same high fever, the same arthritic and teno-synovial signs, the same long convalescence, have been noticed. There is nothing of which I am more strongly convinced than of the identity of these separate elements of erythema multiforme, whose differences are merely those of outward form; such compound cases, if one may so term them, are seen in children occasionally, though less frequently than in adults; in one very severe case of erythema multiforme the infection was traced to another child with the simplest form of erythema nodosum.

Into the question of the supposed relationship of nodal fever to rheumatism I went fully twenty years ago. I pointed out then that Sir Stephen Mackenzie's statistics<sup>13</sup> were not the result of personal observation, but were derived from the records of four London hospitals and compiled presumably by their medical registrars. I sent Sir Stephen a copy of *Nodal Fever* with a letter, but received no reply from him. In December, 1908, when travelling up the Nile, I was introduced to Sir Stephen at Assouan, where he often wintered. It was a most interesting and somewhat amusing meeting; he thought that he remembered my name, but I mentioned that I lived in Australia. "Ah, then," he said, "perhaps we have been in correspondence." When I explained that it required two to constitute a correspondence, and that he still owed me a letter, he immediately recalled the circumstance, and said that he had been intending to reply for more than eighteen months, and that he thought he had the answer amongst his luggage; however, he had not been able to find the document next day when he came down to the steamer to see me. Shortly after he died, and I was unable to procure any information as to the document. - Other writers meanwhile, whose opinion carries much

more weight than mine possibly could, and notably Dr. Odery Symes,<sup>14</sup> Dr. Maxwell Telling,<sup>15</sup> and Dr. Hope Gosse,<sup>16</sup> have gone into the matter carefully and arrived at much the same conclusion as myself. It therefore seems to me to be unnecessary to say more than this—that there are only three cases in my new series in which there is a history of previous rheumatic fever in the patient, and that in none of the three had any organic cardiac lesion persisted; that in four others there was a vague history of so-called rheumatism; and that in only five cases was there a family history of acute rheumatism. Again I wish to emphasize my conviction that the pseudo-rheumatism of nodal fever is an expression of arthritis or of teno-synovitis due directly to the "germ" which causes the skin eruption, or to the toxins to which it may give rise. Above all, I wish to reiterate the absolute uselessness of drugs of the salicylic acid group to ease these pains or to control the course of the disease.

Lastly, roughly speaking, there are no cardiac complications of nodal fever: a transient though distinct murmur may be noted during the illness, but it disappears; it is probably haemic or myocardial.

#### *Tuberculosis.*

When my book was published in 1905, in disputing the rheumatic theory which then held the field, I lightly said<sup>17</sup> that it would be just as easy to prove, as far as mere statistics were concerned, that nodal fever was related to tuberculosis. I little dreamt then how large the tuberculous theory of its origin would loom in the next twenty years, though it was breached originally over half a century ago, or that I should read the dogmatic assertion in a retrospect of the year 1918<sup>18</sup> that "the causative factor of erythema nodosum has now been determined to be tuberculosis." The subject, therefore, requires careful investigation. In this direction again I am forestalled by Dr. Symes, and I can only assert that the proportion of tuberculous manifestation preceding nodal fever is not greater in my experience than one would expect considering how widely spread tuberculosis is known to be, and that tuberculous sequelae are comparatively rare. In my whole series there are only two cases of nodal fever complicating tuberculosis—one a girl of 18 who had suffered since early childhood from morbus coxae, and a young married woman who was at the time suffering from, and who subsequently died of, phthisis. A mother, who had lost a son from tuberculous meningitis, died many years later from erythema papulatum, but without any evidence of being tuberculous herself.

#### OPINIONS OF OTHER WRITERS.

Some writers<sup>19 20</sup> have drawn attention to the fact that nodal fever occasionally follows shortly after measles, and I have notes of one such case. I can hardly think that there is any causal relationship, but the observation is one to be borne in mind.

There are many who still adhere to the rheumatic fever heresy (cf. references 21 to 27), but as a rule they only bring forward one or two isolated cases. Wiborg,<sup>21</sup> however, is an exception, as he recorded an epidemic of thirty cases which he considered to be of rheumatic rather than of tuberculous origin. Hallam<sup>22</sup> writes in opposition to the rheumatic theory.

Landouzy<sup>23</sup> excised a node and found in it Koch's bacillus; he inoculated a guinea-pig with a portion of this node and produced in the animal tuberculous lesions, but he does not himself contend that therefore all cases of erythema nodosum are tuberculous in origin. Ward<sup>24</sup> expresses similar views. Hildebrand<sup>25</sup> obtained with venous blood similar inoculation results. On the other hand, Otto Brian<sup>26</sup> induced tuberculosis in a guinea-pig in one experiment, but failed in all his others. His conclusion was that tuberculosis was the actual cause of erythema nodosum in only a few cases; Dufourt<sup>27</sup> put it as high as 60 per cent. Deléarde and Haller<sup>28</sup> also think that the greater number of cases arise from a tuberculous soil.

Intradermic injection of tuberculin is said<sup>29</sup> to have caused lesions exactly resembling erythema nodosum at the point of injection, but Dr. Darcy Cowan informs me that

he can recall no case following hypodermic injection. Stefano<sup>30</sup> obtained a positive reaction in all the 23 cases in which he tried von Pirquet's test. Vellesen<sup>31</sup> plumps for tuberculosis. Several writers have recorded<sup>32 33 34</sup> the fact of cases of erythema nodosum complicating tuberculosis and winding up with meningitis, and have verified their observations by necropsies. Haug<sup>35</sup> opines that the tubercle bacillus can provoke either erythema nodosum, or a form of arthritis which does not yield to sodium salicylate nor pass so quickly from joint to joint as usual. Meara and Goodridge<sup>36</sup> thought that erythema nodosum occurred under three conditions: (1) as a simple variety of erythema multiforme; (2) as a definite specific contagious disease; (3) as a lesion secondary to many things, such as infectious diseases, drug ingestion, alimentary disturbance, and nerve diseases.

Lastly, several writers have been impressed with the possible infectious and contagious nature of nodal fever. These include: Anderson and Cooper,<sup>37</sup> Clarke,<sup>38</sup> Craig,<sup>39</sup> Durante<sup>40</sup> (who excludes tuberculosis and rheumatism), Wendler,<sup>41</sup> Settgast<sup>42</sup> (who considers rheumatism a complication, not a cause, and excludes tuberculosis from consideration), Dorth,<sup>43</sup> and Moses.<sup>44</sup> Gueissaz<sup>45</sup> finds it to be an acute exanthem, and that marvellous observer Sir Jonathan Hutchinson<sup>46</sup> almost said the same thing more than half a century ago. Amongst English writers Odery Symes<sup>4</sup> bears me out in almost every respect, whilst Maxwell Telling<sup>15</sup> also considers it to be an acute specific disease, but does not agree with me, I fancy, as to its relationship to erythema multiforme.

## THE CHEMOTHERAPEUTIC TREATMENT OF GONORRHOEA AND ITS COMPLICATIONS.\*

BY

J. E. R. McDONAGH, F.R.C.S.,  
SURGEON TO THE LONDON LOCK HOSPITAL.

### *Introduction.*

THOUGH gonorrhoea, when first contracted, is a local infection, nevertheless changes do occur in the blood of the host, particularly in the protein particles of the plasma in which resides the host's main protective substance. Treatment with chemical substances and protein extracts (vaccines) acts by resistance and not by killing the directly. Considering that vaccine treatment alone leaves much to be desired, it has been my endeavour for some years past to find a chemical compound which would have much the same effect in gonorrhoea as has arsenobenzene in syphilis.

The last milestone in this work was marked by the introduction of manganese butyrate, a drug which has proved

\* A post-graduate lecture given at the London Lock Hospital, February 10th, 1925.

of value, particularly in the acute complications of gonorrhoea. These are due, perhaps, more to the invasion of staphylococci than actually to the gonococci. In short, manganese butyrate has a better chemotherapeutic effect in pure staphylococcal than in pure gonococcal infections. As the gonococcus is higher in the scale of bacterial evolution than the staphylococcus, a drug more powerful than manganese butyrate is required to combat its invasion.

Metallic preparations appear to act by increasing the number of the protein particles constituting the defence, thereby augmenting the area exposed to the bacteria. Hydrogen and sodium atoms may effect this change even more effectually than manganese, provided they are liberated from a sufficiently large molecule. Moreover, such atoms are less liable to destroy the host's protective substance and to produce metallic intoxication. Therefore, the ground last covered has been in this direction, and the present paper marks the introduction of two further drugs: (1) the symmetrical urea of meta-benzoyl-meta-amino-benzoyl-amino-naphthol-3-6-sodium sulphate, or "sum 36" for short; (2) the symmetrical urea of para-benzoyl-para-amino-benzoyl-amino-naphthol-3-6-sodium sulphate, or "sup 36." The former is to be preferred in pure gonococcal infections, and the latter in the complications arising from the superinfection of Gram-positive cocci. Both drugs were kindly made at my instigation by Mr. T. H. Fairbrother of the British Dyestuffs Corporation, Ltd. They have been in use since the latter part of 1923, and the following practical conclusions are derived from the treatment of several hundred cases.

#### *Gonococcal Urethritis and Vulvitis.*

In the male two intramuscular injections of "sum 36," each of 0.002 gram, should be made at five days' interval. In the female it is better to inject 0.01 gram intravenously. The two injections should be followed by a course of vaccines. In most cases of fresh infection this treatment suffices. Any recurrence of an acute discharge can be stopped by two further injections of the urea compound. Provided the patient is not on the point of developing an acute posterior urethritis or an acute cervicitis when the first injection is made, no complication need be expected. The immediate effect of this drug in acute gonorrhoea is disappearance of the subjective symptoms and lessening of the discharge.

#### *Pure Gonococcal Complications.*

Under this heading are included acute ophthalmia and acute primary, as opposed to recurrent, arthritis associated with a copious urethral, vulval, or cervical discharge. In these cases "sum 36" is the drug of choice. In gonorrhoeal ophthalmia in infants one or two intramuscular injections, each of 0.004 gram, will clear up the acutest case. In a boy of 6, who had a prolapsed iris, a single injection of 0.005 gram of "sum 36" caused an enormous improvement of the lesion within forty-eight hours, by which time the iris had regained its normal position. In adults the dose should be 0.01 gram, and the injections may be made either into the muscles or into the veins. In acute primary arthritis a single injection of 0.01 gram will cause the pain and swelling of the joint to disappear the following day.

#### *Gonococcal Complications due in part to Secondary Micro-organisms.*

Belonging to this category are the following clinical conditions: (1) acute Cowperitis with abscess formation; (2) acute prostatitis with abscess formation; (3) acute cystitis; (4) acute epididymitis and salpingitis. In all these cases two injections of "sup 36," each of 0.01 gram, should be made intramuscularly or intravenously at three days' interval. The two injections should be followed by one or more courses of vaccines. But in cases of epididymitis and salpingitis the vaccines should be preceded by an intramuscular injection of contramine (0.25 gram). This injection of contramine, which is the carbon disulphide product of di-ethyl-amine, reduces the formation of fibrous tissue to the minimum and thereby lessens the liability of a local recurrence in the future. Bearing in mind the common

view that cases of salpingitis need operating upon, it is interesting to record that in twelve cases treated with "sup 36" all were up and about within a week of the first injection. The day following the initial injection the temperature became normal and the subjective symptoms vanished. In a case of gonococcal periostitis of the upper end of the tibia, which looked as if it needed incision, a single injection caused the redness, swelling, and pain to vanish the next day.

#### *Chronic Complications of Gonorrhoea.*

Under this heading are included stricture, chronic epididymitis, conjunctivitis, and iritis, and the various forms of muscular rheumatism—neuritis, fibrositis, teno-vaginitis, and arthritis. Contramine, probably by reason of its sulphur content, is a softener of fibrous tissue, and many strictures resisting dilatation may be rendered dilatable by injecting intramuscularly one dose of 0.25 gram and two doses of 0.5 gram at approximately weekly intervals. This treatment is advised in cases of chronic epididymitis, but it should be succeeded by a course of vaccines, because micro-organisms hidden by the fibrous tissue may be released as the latter is destroyed. Bilateral conjunctivitis is a common harbinger of polyarticular gonococcal arthritis. Since patients with this prodromal symptom are often much debilitated care must be used in stimulating their resistance, and it is wiser to make three injections of contramine, each of 0.125 gram, on alternate days. Six half-doses of vaccine (I use 1,250 million Lock Hospital vaccine, made by our pathologist, Major V. Corbett) should then be prescribed and injected every second or third day. Following this the injections of contramine should be repeated in half or full doses according to the patient's condition, and the treatment concluded with another course of vaccines. The same treatment should be adopted in severe cases of gonococcal iritis and in gonococcal arthritis when the patient is really ill. Where it is obvious that the host's resistance is at its lowest ebb, no injections should be made. In ordinary cases of gonococcal rheumatism, neuritis, fibrositis, teno-vaginitis, and arthritis 0.25 gram of contramine should be injected as soon as possible, followed by two further injections, each of 0.5 gram, at five to seven day intervals. Then a course of vaccines should be prescribed—four doses of 2,500 million and four doses of 5,000 million injected at weekly intervals. A second course of contramine and vaccine injections may or may not be necessary. In no circumstances should an infected joint be put up on a splint, and neither the prostate nor the urethra should be examined while the arthritis is active. An infected joint should be exercised at the earliest possible moment.

#### *NOTE ON THE USE OF CHEMOTHERAPEUTIC PREPARATIONS.*

The urea compounds are soluble in water. They should be dissolved in distilled water, and preferably just before use, particularly if they are to be injected intravenously. Intramuscular injections may be made anywhere, provided the bulk of the solution does not exceed 1 c.cm. The preparation "sup 36" is useful in many inflammatory conditions other than those met with in gonorrhoea. Owing to the large size of the nucleus or molecule of the urea compounds an injection may be followed by a mild degree of shock. The occurrence of shock is very rare and passes off in a few minutes.

Contramine must be injected into the gluteus medius; it should never be allowed to get into the subcutaneous tissue for fear of the formation of a sterile abscess. The recipients of contramine should avoid alcohol for two or three days after each injection, because in a few cases the taking of alcohol is followed immediately by flushing and giddiness. Contramine, provided it is not more than a year or so old, is soluble in distilled water; solutions should always be freshly prepared. It is equally valuable in cases of rheumatism of other than gonococcal origin, but in the type met with in women round about the menopause thiol-histamine, injected in 0.002 gram doses on three successive days, is better. Both these sulphur preparations were made for me by the British Drug Houses, Ltd.

## OESOPHAGOSCOPY: A MEANS OF DETECTING FOREIGN BODIES NON-OPAQUE TO X RAYS.

BY

W. FRANK WILSON, M.B.,

HONORARY ASSISTANT, THROAT AND EAR DEPARTMENT, ROYAL VICTORIA INFIRMARY, NEWCASTLE-ON-TYNE.

THE fish bone, and often the dangerous sickle-shaped haddock bone, is one of the commonest of the various foreign bodies which become lodged or impacted in the human gullet. In such cases the information obtained from an x-ray screen examination or from a radiogram is generally unsatisfactory and may be misleading. The bismuth pastille and attempts to get some barium porridge to adhere to the foreign body have nearly always failed us.

In a certain number of cases we are convinced that a foreign body is present because of the symptoms and condition of the patient, but we are not sure where it is, though I admit that in this group the average patient locates the level fairly accurately. In another, perhaps

more important, group of cases there exists a doubt, not only on the part of the surgeon but on that of the patient, as to whether a foreign body is present or not; an x-ray examination and radiogram turns out (in the case of a fish bone) to be negative, and the patient may be allowed to go without anything further being done. A certain proportion of these people actually have an impacted bone in the gullet, and one of three

FIG. 1.—Radiogram showing shadow of bariumized wool mass enveloping fish bone in upper portion of gullet.

things may occur: (1) the bone may become loosened and pass into the stomach; (2) the patient may vomit the bone; (3) peri-oesophageal abscess, septic mediastinal infection, or haemorrhage from erosion of one of the large blood vessels, and death. Again, in the case of a "suspected" fish bone in the gullet, oesophagoscopy, without any definite information as to the level of the bone, may be negative, and the "intruder" may be vomited soon afterwards (if the patient is thus fortunate) owing to the manipulation of the tube causing disimpaction.

The above examples are a few of the snags which occur every now and then to the experienced oesophagoscopist; they will necessarily occur much more frequently in the hands of one who is not so experienced.

Any reliable information, therefore, obtainable before passing the tube, and, in addition, something which will arrest the eye at the level of the foreign body during the passing of the tube, will assuredly help to lessen the difficulties and dangers that sometimes crop up in such cases. Both of these desirable aims are attainable by the following simple method.

Small pieces of cotton-wool are lightly teased out to the size of a shilling or slightly larger and soaked in barium porridge, and are given to the patient to swallow one at a time to the number of six to eight pieces. A minute or so afterwards a teaspoonful or more of barium porridge is swallowed. Two or three minutes are then allowed to elapse to give any surplus barium time to leave the gullet.

This, of course, should all be carried out in the x-ray room. The gullet is then radiographed. The radiogram (Fig. 1) needs no description except to note that the shadow of the wool mass held up round about the foreign body is invariably of inverted "cone" shape. On passing the oesophagoscope, the lustrous white reflex from the upper part of the bariumized wool immediately arrests the eye. In every one of the cases of large haddock bone the latter has been found closely invested by the wool, like a chrysalis in its cocoon. Figure 2 shows this quite clearly.

In some of the cases the bone was recovered together with the main mass of wool after several small pieces of wool had been removed from its upper end. In other instances, where the bone was firmly impacted in the gullet wall, the wool required removal piecemeal until the exact site of impaction was recognized and disimpaction carried out.

In all of the cases in which this method has been employed so far the site of impaction was the upper part of the gullet, as it usually is in this variety of foreign body. With the exception of one case, that of a stockily built man with a short "bull" neck, oesophagoscopy was performed under local anaesthesia in conjunction with a hypodermic injection of morphine and atropine given three-quarters of an hour or so before.

The last case of the series was that of a man who stated that he had swallowed a meat bone, which he thought had "stuck" in his throat. Radiography without the bariumized

FIG. 2.—Photograph of a fish bone enmeshed in the bariumized wool after removal from gullet.

wool was negative on two occasions; on the third, with bariumized wool, it was positive. On recovering the meat bone the reason for the negative result was discovered, the bone being an extremely thin transparent disc about the size of a two-shilling piece.

In conclusion, it is perhaps as well to note that a contra-indication to the use of this method would be any degree of dyspnoea in association with a foreign body suggesting involvement of the larynx.

I have to thank Mr. J. F. Krige, house-surgeon to the throat and ear department, for the care he took in carrying out the details preliminary to x-ray examination; for the latter I have also to thank Dr. H. E. Gamlen, honorary assistant medical officer to the electrical department.

## Memoranda :

### MEDICAL, SURGICAL, OBSTETRICAL.

#### THE SEPARATION OF THE PLACENTA.

For some time it has seemed to me that to ligature the maternal end of the umbilical cord after the birth of the child is a useless and in many cases a harmful procedure.

My attention was first called to this point when performing Caesarean section, when the object was (after the extraction of the child) to get the uterus as fully contracted as possible before introducing sutures. I noticed then that by leaving the maternal end of the cord untied, so that it could bleed freely, the placenta was more easily removed and the cut uterus contracted more rapidly and firmly and consequently needed fewer stitches.

Then again, after delivery in septic cases, such as often occur in Kashmir, where hollyhock root, cow dung, fowl intestine, and quince seeds are found in the vaginae of women treated by the native midwife, and where the cord when cut sometimes exudes a yellowish juice suggestive of faecal matter, it seemed a distinct advantage to

get rid of as much of this as possible, and I considered that the placenta came away more quickly when the maternal end of the cord was not tied but left to drain.

While the child is living and attached to the mother the blood pressure in the cord is positive. When the cord is cut and the maternal end is allowed to bleed the pressure in the cord is negative, the blood is drained out of the placental vessels, and the villi shrink in the maternal sinuses and collapse, thus favouring their detachment from the uterine wall.

Each contraction of the uterus causes blood to exude from the cut end of the cord and the placenta diminishes in volume, and each relaxation of the uterus will only loosen the villi dipping into the sinuses. Each pain causes contraction of the uterus and placental site.

On the contrary, the usual procedure of ligating the maternal end of the cord causes the pressure in the cord to remain positive, and when the uterus contracts the villi are full and the uterus cannot contract fully. When the uterus relaxes there must be a suction action exerted on the placenta, and its expulsion is delayed. I am inclined to think that tying the maternal end of the cord is inadvisable because—

- (1) It delays delivery of the placenta.
- (2) It prevents full contraction of the uterus, thus leading to increased haemorrhage.
- (3) It increases liability to retention of placenta or portions of it.
- (4) It involves a risk of septic infection through maternal sinuses which are still kept open by the engorged villi.

Perhaps, one of the chief factors in the normal separation of the placenta from the uterine wall is the tendency of the empty villi to detach themselves; this may explain why the common and reprehensible custom of the native midwives of pulling on the cord to remove the after-birth is not so deadly as it sounds. They do not, as a rule, tie the upper end of the cord; if they did it would be easy to understand that pulling on it with the villi full of blood and intimately connected with the maternal sinuses might invert the uterus.

London, N.W.

KATHLEEN VAUGHAN, M.B.Lond.

### TORSION OF FALLOPIAN TUBE.

In the *Epitome* (BRITISH MEDICAL JOURNAL, March 14th, para. 287) there is a note of a case of torsion of a normal Fallopian tube recorded by P. R. Michaël. The following case presents a close parallel.

A single woman, aged 19, was admitted to the Royal Infirmary, Preston, at 6.30 p.m. on March 12th, with acute pain in the right iliac fossa which had come on suddenly at 3 p.m. She had been vomiting continuously since, and was obviously suffering very acute pain, sitting up in bed to obtain relief. The abdomen moved well with respiration, and tenderness was marked in the right iliac fossa, which was rigid. The temperature was subnormal, but the pulse was 112; the urine was normal.

The abdomen was opened by a right rectus incision. The appendix was slightly congested and was removed. The pelvic organs were then explored. The right Fallopian tube was easily brought up to the wound, and was found to be black and swollen to the size of a small Victoria plum. The tube with its mesosalpinx was found to be twisted in a clockwise direction about 1 inch from the uterine end of the tube. The part of the tube proximal to the twist was quite normal, but distal to the twist the tube was deeply congested and swollen. The mesosalpinx was abnormally long as compared with that of the left side. Both ovaries were normal. There was no sign of tumour formation and no adhesions. The twist was undone by turning in anticlockwise direction and the tube removed. The abdomen was closed without drainage.

On cutting open the tube, no blood clot was found in the lumen of the tube and no diverticula noted. The wall was very congested and thicker than normal. The twist occurred into the wall, but no evidence of peritonitis was seen. The menstrual history elicited was to the effect that she was menstruating the day of the incident and had been for two days previously. Her periods had commenced when 14 years of age, and came on every six weeks.

In this case, as in Michaël's, there were no adhesions, tumour formation, hernia, or any external cause for torsion. Also, in this case, there was a definite relation to menstruation.

I am indebted to Mr. W. McKerrrow, F.R.C.S., honorary surgeon, for permission to publish this case.

DAVID J. DAVIES, M.R.C.S., L.R.C.P.,  
House-Surgeon, Preston Royal Infirmary.

## Reports of Societies.

### THE TREATMENT OF SEPTICAEMIA.

A MEETING of the Sections of Medicine, Surgery, and Pathology of the Royal Society of Medicine was held on March 24th to discuss the treatment of septicaemia; Dr. ROBERT HUTCHISON presided.

#### MEDICAL TREATMENT.

BY

SIR THOMAS HORDER, Bt., M.D., F.R.C.P.

Sir Thomas Horder, in opening, said that his own practice in the treatment of septicaemia differed very little from what it was ten years ago, and he believed this was the case with practitioners in general. He proceeded to define septicaemia as a condition which, although often associated with a primary source of infection, was largely independent of such an association; in some of the most characteristic cases of septicaemia the primary focus might be so inconspicuous as to remain undetected throughout the course of the disease. Septicaemia, therefore, was a condition in which micro-organisms existed and multiplied in the blood independently of the primary focus of infection or of the state known as "focal sepsis." Apart from certain much less common organisms, the two chiefly to be considered were *Streptococcus pyogenes* and *Staphylococcus aureus*. The main principles of treatment fell into three groups: general measures, bacteriotherapy, and chemotherapy. He put general measures first because they had chronological precedence; certain general measures were naturally taken even before the exact bacteriological diagnosis was established, and promptness in respect of these measures was the essential point in the treatment. According to some practitioners, bacteriotherapy would come next in order, and according to others chemotherapy. In the treatment of no disease did the personal equation of the doctor enter so largely as it did in acute septicaemia, not merely because the practitioner was apt to become enamoured of a particular line of treatment, but because there were so many possible things to do. The choice was so large that it was necessary to form a plan of campaign in every case, and not introduce, with an air of panic, new remedies at any particular juncture.

He took as an example a case of *Streptococcus pyogenes* infection of an acute kind, such as one in which the primary focus was a post-mortem wound of the finger, followed rapidly by cellulitis, lymphangitis, and general infection. The first general measures were rest (including rest for, in this example, the infected limb), fresh air, and sunlight. Fresh air was important in the treatment of pyogenic infections, and if the alarm which some patients felt at this procedure could be overcome they should certainly be treated on a balcony, or, if the season permitted, in the open air altogether. He could testify to the good effects of a full diet, which need not be entirely fluid unless it be during the height of the acute process. In some cases septicaemic patients required a good many calories of food, and very frequent feeds. Another important item in treatment was reassurance, by which he meant the general conduct of the patient's mind and his attitude towards his condition. This was the more important in a disease in which the treatment was hardly less irksome than the disease itself. A great deal of tact and coaxing was often required to get the various measures carried out without upsetting the patient's equanimity. In America hydrotherapeutic measures were favoured a good deal, and perhaps more might be done in the way of hydrotherapy here, since it was not absolutely necessary to take the patients out of bed for the purpose. Attention to elimination—bowels, skin, and kidneys—was important, as also was sleep. As to anodynes, Sir James Paget, after convalescence from his own acute septicaemia, paid a high tribute to the value of opium. There was no contraindication to the use of opium in a good many septicaemic cases; in these days, Sir Thomas Horder thought, there was an unjustifiable tendency to be afraid of opium in acute febrile conditions which were prolonged and which led to physical and

mental discomfort. Conference with a surgical colleague would be necessary, in the case he had taken as an example, with regard to treatment at the site of infection by surgery and drainage. He had found it useful to alternate the continuous bath with the almost vertical elevation of the infected limb. Care should be exercised to avoid the local use of strong antiseptics, which interfered with the vitality of the tissues. Intravenous infusions were useful in the fulminating type of case. His experience of transfusions in three really bad cases was not promising; perhaps other observers had been more fortunate. Drugs had to be taken in conjunction with the other measures already described. He placed arsenic first, administered intramuscularly for preference; from this drug very few cases of septicaemia did not derive some benefit. His favourite preparation was sodium cacodylate, and he gave it in conjunction generally with the drug he put next on his list—namely, nucleinic acid—usually 1 grain of sodium cacodylate in a saturated solution of nucleinic acid, 1 c.cm. for convenience, and this was given intramuscularly twice in twenty-four hours for the first two or three weeks of an acute case. Sodium cacodylate had very low toxic effects *qua* arsenic, and a convenient method of knowing that the patient was receiving an effective dose was the smell of the breath. After arsenic and nucleinic acid he would place opium. He did not think that the reputation of quinine was borne out by experience. Alcohol was also of considerable value in very acute cases.

Turning to specific measures, Sir Thomas Horder said that in a case of acute streptococcal septicaemia his general rule was to give a very liberal dose of antistreptococcal serum intravenously as soon as the patient came under treatment—not less than 50 c.cm. on the first day, repeated on the second, and possibly on the third, and his choice in the *pyogenes* type of infection—which these acute cases invariably were—was the univalent form of the remedy. By the second or third day the causative organism was usually isolated and a vaccine could be prepared. In this acute type of case the sensitized vaccine had advantages over the ordinary vaccine. The first dose recommended in an adult was 100 million, the second 250 million on the third day, and the third dose 500 million on the fifth or sixth day. If ordinary vaccines were given the doses were much smaller—perhaps half a million, 1 million, or 2 million, according to the severity of the case, the doses being spaced in accordance with clinical observation. He had practically no experience, in acute cases, of detoxicated vaccines. "Immunogen" was a type of antigen which differed from vaccines in that an attempt had been made to get into the antigen, in addition to the endotoxin of the organism, certain products of auto-digestion, and disintegration by heat and chemical action, of the cell structure of the organism. He had also put on his list under "bacteriotherapy" some combined methods, by which was meant starting with serum and following with vaccine, this being the practice favoured by most workers. Chemotherapy seemed to him, for pyogenic infections, very disappointing. During the war a good many accounts were published of the effect of a lavage of the blood stream in septicaemias. War experience in this class of case, as in a good many others, had to be considered in relation to the circumstances, the type of injury, the help given by the surgeon in regard to the primary focus, and so on. The intravenous use of various germicidal substances—chlorine derivatives, flavine, colloidal metals—seemed to him to have been not very helpful in civilian practice.

Sir Thomas Horder next touched upon the acute form of septicaemia due to *Staphylococcus aureus*. This was fulminating, and not leading to such lethal conditions as pericarditis, and if the focal abscess chanced to be in a position in which the surgeon could deal with it, better results were likely, inasmuch as time favoured the pyaemia. This advantage had to be placed the fact that there was nothing equivalent to an antistreptococcal serum in fighting a case of acute staphylococcal septicaemia. So far as bacteriotherapeutic methods were concerned, one fell back upon vaccines, which, however valuable they might be in

the more chronic and localized forms of infection by the staphylococcus, were not so helpful in the generalized acute and chronic conditions. With regard to chronic streptococcal septicaemic processes, the treatment of the most tiresome and perhaps most common type of the disease—namely, ulcerative endocarditis—seemed to him to be still very baffling. Of late years he had been struck by the fact that the more one pursued certain general measures the more hopeful became the treatment of the condition, which seemed to be an infection of very low resistance. He described a case of ulcerative endocarditis which, after a great deal of vaccine therapy and chemotherapy, was sent almost in despair to the South of France, and had improved markedly as the result of living entirely in the sun and air. The spleen had become very large during the six months' residence abroad—it occupied the whole of the left half of the abdomen; there was a suggestion that the improvement was associated with the splenomegaly by way of some specific contribution to the patient's resistance through the infarction of this organ. The speaker, in conclusion, referred once more to the value of non-specific measures in the treatment of all cases of septicaemia, and regarded them, in the present state of our knowledge, as of great importance.

#### SURGICAL PROPHYLAXIS AND TREATMENT.

BY

R. P. ROWLANDS, M.S., F.R.C.S.

Mr. R. P. Rowlands dealt with the subject from the surgical point of view. Touching first on prophylaxis, he said that the surgeon aimed to prevent local and systemic infection by (1) taking every precaution against infection during operations; (2) prompt excision of contaminated wounds such as those inflicted in war or, in civil practice, by accident; (3) prompt removal or treatment of local sources of systemic infection, such as acute appendicitis. This treatment was still too often delayed, with the result that nearly 3,000 people in England and Wales died every year from appendicitis, nearly all of them owing to the septicaemia of peritonitis. He himself had never lost a case of appendicitis which had been operated on within twenty-four hours. What had been said with regard to early operation in appendicitis applied equally in the perforation of peptic ulcers, and, more or less, in abscesses in other parts of the body, which should be opened without delay before they caused septicaemia. Many a life was lost from septicaemia by delaying amputation until it was too late, especially in such cases as acute infective osteomyelitis of the long bones. On opening an abscess, boil, or carbuncle, it was important not to trespass on and infect the surrounding healthy tissues. He had known septicaemia follow the too deep incision of a small boil in the auditory meatus. With regard to treatment, there should be collaboration between physician, surgeon, haematologist, and bacteriologist, and an endeavour should be made to find, and remove or treat, the primary or other source of infection. The hope of finding a collection of pus somewhere in the body should never be given up. The opening and draining of such an abscess often brought success in apparently hopeless cases. Repeated examinations of the blood for leucocytosis should be made, also systematic and complete examinations of the body for hidden collections of pus. Sir Thomas Horder, in an obscure case of acute septicaemia which he saw with the speaker, diagnosed suppuration in a thyroid cyst which was low in the neck and mostly intrathoracic in position. Removal of the cyst, which was full of streptococcal pus, cured the patient. Many similar instances came into his mind of pus found in hidden places, such as deep in the buttock, in the loin, under the diaphragm, in the liver, in the pleura, deep in the calf muscles, and in the pelvis or prostate. Whole-blood transfusion was valuable in selected cases, and would probably have a greater future than immunotransfusion because it was more immediately available, and time was obviously of great importance in acute septicaemia. Of splenectomy for septicaemia he had had no experience, but some success had been recorded at the Mayo Clinic in subacute cases when the spleen was enlarged, although they had had no recoveries in cases of ulcerative endocarditis.

## IMMUNIZATION AND CHEMOTHERAPY.

BY

LEONARD COLEBROOK, M.B., B.S.

Dr. L. Colebrook described some observations which he and his colleagues had made at St. Mary's Hospital bearing on a study of the essential lesion which made these cases of septicaemia so fatal. In most septicaemias the breakdown of the mechanism of defence must be associated with a diminution of the functional activity of the leucocytes. Although they were present in normal numbers, the leucocytes were often, to all intents and purposes, out of action—their function was reduced to anything from one-half to one-tenth of the normal. That was largely the reason why the microbes were able to establish themselves in the blood stream and why the patient so frequently did not recover. It was not known precisely why the leucocytic efficiency was so injured, but it was assumed to be due to the microbe toxins. This reduction of function was not confined to cases of septicaemia; it occurred in a smaller measure in all local infections, even in a common cold, but in septicaemia it was seen in an extreme form. It was not the whole story in septicaemia, but it filled a large part of the picture. What one had to do to save the patient was to neutralize the toxin which was destroying the leucocytes, or—the same thing—to kill off a large number of the micro-organisms. Dr. Colebrook then went on to deal with three lines of specific treatment: active immunization, passive immunization, and chemotherapy. With regard to active immunization in cases of septicaemia he was not hopeful. Treatment by vaccines was not likely to be successful, at any rate in the grave cases where the leucocytic function was reduced to below half the normal. With regard to passive immunization—meaning the use of sera and immunotransfusion—the use of sera also seemed rather hopeless at present. One of his colleagues had been doing some work on an antistreptococcal serum, but his conclusions were not very encouraging as to the value of this agent for fortifying the patient's blood. The price which patients had to pay, in the shape of the miseries of serum sickness, made the use of serum hardly justifiable until at least it was possible to say definitely that one particular serum was good, or better than another. With regard to immunotransfusion, this was introduced by Sir Almroth Wright, who suggested that a non-specific immunization of the donor's blood should be obtained before use. The practice had been to give the donor 1,000 million of the staphylococcus and to wait three or four hours, and then take the blood. A good many cases, mostly of puerperal septicaemia, had been treated by this method in the last year or two, but on the whole the speaker had been disappointed. He did not think that grave cases would be saved by this method alone. In some of the slighter cases it would be useful. It was hoped to get a more effective method of immunizing the donors, and he was working towards a specific immunization. Possibly in conjunction with chemotherapy, immunotransfusion would prove of great value.

Unlike the two previous speakers, Dr. Colebrook felt that the whole future for these cases was bound up in chemotherapy. Before a drug was used as a chemotherapeutic agent in septicaemia it must be demonstrated that the drug would not still further diminish the patient's leucocytic efficiency or destroy other essential tissues, and that the patient's blood after a given dose could be shown to be bactericidal to the infecting micro-organism and so continue for a certain period, or that it was capable of neutralizing toxins. Eusol, flavine, and other drugs had been tried, and did not fulfil the latter part of these requirements; but there was one group of drugs which was more hopeful—namely, the neosalvarsan group. When neosalvarsan was given to a patient in the medicinal dose for curing the syphilis, and the patient's blood was taken after a period, perhaps one hour or up to six hours, it was found that the serum, which previously had no power of killing the streptococci, had now considerable power, and usually, he thought he might say, the leucocytes were not harmed. He felt that this was the beginning of better things in the treatment of septicaemia. In America and France some hopeful work had been done along these lines.

## THE PATHOLOGIST AND THE CLINICIAN.

BY

SIR ALMROTH WRIGHT, M.D., F.R.S.

Sir Almroth Wright said that there were two ways of viewing medicine, one of which was illustrated by the clinician's view put forward that evening, and the other by the contentions of the pathologist. He compared clinical observation of the results obtained with different remedies to the experience of a man who was accustomed to travel on railways, and who gave his views, based on that experience, of recent railway engineering progress; whereas the pathologist found his analogy in the skilled engineer, who was able to say exactly in what respects the science of transportation had been improved and in what respects it came short. With regard to immunotransfusion, he did not want this to be put down as one of the failures of pathology, but it was true that what it could accomplish was quantitatively limited. It depended upon the number of micro-organisms which had to be dealt with in the blood, and it was certainly no remedy in the severer cases. He criticized the tendency of the clinician in appealing invariably to the remote results, and paying no heed at all to the immediate results. The clinical method could, indeed, take no cognizance of the direct result, because that direct result could not be seen by the naked eye—it was discovered only by laboratory experiment. He hoped that in discussions of this sort at some future time—it might be a hundred years hence—it would be acknowledged that the clinician could pass no absolute verdict; all he could say was, "this has been recommended, and on the whole has proved beneficial."

## FURTHER DISCUSSION.

Mr. ZACHARY COPE said that after such a slashing attack on the clinicians it was difficult to say anything more from the clinical side, but at the same time he felt bound to point out that the pathology of the blood was not yet known. Surrounding the problem of immunity in a large measure were doubts and suppositions—only the shibboleths could be uttered, "We believe, we think, we hope." True, there were factors which were certainly known and which could be demonstrated under the microscope, but there were many more things not yet found out, and quite as essential to the elucidation of the problem of immunity in septicaemia as the things already known. How was it proved that the leucocytes were the only or the chief agents in immunity? How was it that certain micro-organisms selected certain parts of the body for their activity, and chiefly those tissues only? The gonococcus grew when invading the mucous or serous membranes, but put it in the connective tissue and there was not much formation of pus. What was the function of the cellular tissue of the body in resisting septicaemia? What was the protection accorded to the body by the epithelium apart from the leucocytes? Until accurate knowledge was forthcoming on the selective activity or protective defence of the epithelium and connective tissue they were all in a maze. Immunotransfusion had proved a straw in these cases of septicaemia. Until some definite knowledge on all these points was forthcoming, the clinicians, while trying everything which was put before them from the scientific side, must also be allowed to use their judgement, face to face with patients. So many problems still remained that it was not wise to dogmatize overmuch.

Mr. HERBERT TILLEY gave an account of an attack of septicaemia from which he himself suffered fifteen years ago. He received a prick on the knuckle through a glove. The day previously he had returned from a six weeks' holiday, and he never felt better in his life, so that the question came up as to whether his immunity had been lost during his holiday. On the evening of that day he felt a slight irritation at the site of the prick, and the next morning noticed a blush on the knuckle and some red streaks up the wrist, very like the photographic illustrations of a lightning flash. During the day he felt unwell and had a raised temperature. A colleague gave him an injection of antitoxic serum, after which he felt for a time perfectly well, but at night he had two or three shivers, and became very ill with a high temperature. Within the week following he

had seven operations, and at the end of that time there were seventeen drainage tubes in position in his arm. Then a profuse leucocytosis set in, the arm began to suppurate, and from that moment he turned the corner. He found enormous benefit from having the arm in a hot bath, and also from holding it up, clinging to some support above him. Sleeplessness with high temperature was a great trial. Morphine made him feel ill next day. Heroin suited him very much better, but those things failed in time, and then he tried tincture of opium, chloral, and bromide, with good results.

Dr. ROBERT HUTCHISON, in closing the discussion, noticed that alcohol had not been mentioned as a general means of maintaining the patient's strength in septicæmic infection. He understood that the experimental evidence was rather against its use, but the effect of alcohol on an animal and on a man might be two rather different propositions.

### FOOT-AND-MOUTH DISEASE.

At a meeting of the Comparative Medicine Section of the Royal Society of Medicine held on March 25th, the President, Mr. F. H. HODGKIN, in the chair, Sir STEWART STOCKMAN gave an address on some problems of foot-and-mouth disease.

The subject, he said, was very difficult to treat satisfactorily in the short time at his disposal. There was a large amount of information available on the subject of foot-and-mouth disease, but it could not be readily summarized. He proposed considering the question at this stage from three aspects—*invasion, susceptibility, and immunity.* The incubation period of the disease might be as short as forty-eight hours, but was normally about five days. As long a period as three weeks had been recorded, but he was very sceptical about such records. He thought that in these cases the virus had been carried on the animal's coat for some time, and afterwards licked off. Lesions were common on the tongue (where the vesicles were often confluent), on the snout, teats, and even in the intestine. They were largely superficial, a fact which accounted for their quick healing. The virus seemed to attack the horny layers of the epidermis. Thus the horn of the claws was frequently detached by being underderrun by the virus. This doubtless accounted for some of the "carriers" of foot-and-mouth disease. In thousands of cases, however, he had only seen three animals which could be thus implicated. The horn took six to eight months to slough off, and it was only when it was completely detached that the virus was released and the new infection started. The disease was not a fatal one. As a rule the mortality was about 4 per cent., but in very virulent outbreaks as many as 20 per cent. died. The great trouble was the dislocation of business due to restrictions of trade. In milch cows the value of the animal would often be considerably reduced through damage to the udder, feet, and so on.

Methods of invasion, Sir Stewart Stockman continued, were very difficult to determine. He could definitely rule out animals as the source of the initial outbreaks. Men and hay and straw were undoubtedly capable of mechanically carrying the virus. Hay and straw were not imported from countries where the disease was known to exist, but it was impossible to control the straw used in packing, and this might possibly be one method of invasion. Our greatest danger was from the neighbouring countries in Europe and from the Argentine, where the disease was common and completely uncontrolled. He did not think that men and foodstuffs, however, were the usual causes of outbreaks. He had examined the records for the last thirty years, and he had found that about eighty were what he might call "invasion" outbreaks. These were either initial outbreaks, or outbreaks which occurred at a long distance from any other or within such a short time of another as to be obviously distinct. When analysed these outbreaks disclosed some interesting features. Only two had originated in Scotland, while over 50 per cent. had occurred south of a line drawn from the Wash to the Severn. In that area two well defined areas—east and west—had been the scenes of the greatest number of outbreaks. Practically all the

others were located on the coast or the river valleys. He thought that the agency of man or foodstuffs was too fortuitous to explain this distribution, and he believed it was due to migrating birds. Scotland received birds almost exclusively from the north, where the disease was absent. An analysis of the times of the outbreaks seemed to support this view. The virus could live for three months under favourable conditions. Cold and dark favoured it, while it was destroyed quickly at its incubation temperature. Hay or straw prolonged its life. Drying in the sun was rapidly fatal, but if dried in gentle heat it lived for months. It was still infective in dilutions of over a hundred thousand. The susceptibility of the various animals varied. Cattle, pigs, and sheep were very susceptible; but the disease took several days more to pass from cattle to sheep than from cattle to cattle. Once established, however, this period was reduced to normal in sheep as in cattle. Goats were only slightly more resistant to the disease. Horses, dogs, and cats were only occasionally attacked; while fowls were relatively insusceptible, if not completely resistant. All could transmit the disease mechanically. Rodents were an important factor; but he did not think that rats naturally contracted the disease. After an outbreak cattle-sheds were disinfected and afterwards used without the disease recurring, although the rats did not leave the premises during the intervening period. Guinea-pigs were important from the laboratory study of the disease. A serum conferring a passive immunity for a fortnight would be most useful for "exposed to infection" animals. These animals, which were slaughtered at present, constituted about 90 per cent. of the total. If these could be given a passive immunity for a few weeks it would enormously decrease the expense of controlling an outbreak.

Dr. ARKWRIGHT said that the two most important discoveries in the study of the disease were—first, the discovery that the cause was a filterable virus in the true sense of the word; and, secondly, that a passive immunity could be given by the blood. In the laboratory study of foot-and-mouth disease the discovery that the guinea-pig was a suitable host had placed in the hands of workers a most valuable instrument. This animal had the additional advantage that the disease did not naturally pass from guinea-pig to guinea-pig.

### BACTERIOLOGY OF PUERPERAL SEPSIS.

At a meeting of the Edinburgh Obstetrical Society held on March 11th, Dr. JESSIE EYLES read a paper on some problems in the bacteriology of puerperal sepsis.

Dr. Eyles first dealt with the possibility of auto-infection with vaginal organisms, metastatic auto-infection from other foci in the body being an acknowledged fact. Streptococci were isolated from the vaginal secretion of nineteen out of seventy non-pregnant women, and from eleven out of seventy pregnant patients. All of the first series were non-haemolytic types and one of the second was haemolytic. The existence of such organisms in the vagina was no proof that auto-infection occurred; haemolysis was not a test of virulence. Animal experiments had not shown that these organisms were capable of producing an acute infection. No case had been recorded where an organism was isolated from the vagina in pregnancy and was shown later to have been the cause of fever in the puerperium. Agglutination experiments suggested that the reason why these vaginal organisms seemed to be harmless for their carrier was that she was immunized against them. Only in cases where there was much lowering of resistance due to bleeding, bruising, or exhaustion were these organisms likely to cause an acute infection; the dangerous organisms were those introduced from without. The second question dealt with was the significance of blood invasion in puerperal fever and in septic abortions. The uterus after the fourth day of the normal puerperium was always heavily infected with organisms, which had ascended to it from the vulva; among these organisms were streptococci. The same was true of the uterus in incomplete abortions; streptococci were isolated in four out of six cases of incomplete abortions, which were afebrile before and after

curettage. One of the strains was haemolytic. It had been shown that, apart from the existence of any virulent infection, when the uterus contracted in incomplete abortion, any of the organisms normally present in it might be forced into the blood stream through the open veins of the placental site. There they were soon destroyed, but the patients reacted to each invasion with a rigor. A positive blood culture in such cases before the uterus was emptied was not necessarily of serious import. When the uterus ceased to contract rigors would cease, provided that there had been no true infection present. Emptying the uterus would do no harm in this type of case, but where no auto streptococcal infection of the uterus wall was present local interference would aggravate the condition. In puerperal fever, on the other hand, blood invasion was always serious and indicated that an infection was present, which had spread beyond the uterus and reached the pelvic veins. In nine out of sixty-two cases of puerperal fever organisms were recovered from the blood. Four of the nine cases were fatal, and the others were serious cases. The organisms found were: haemolytic streptococci, three cases; non-haemolytic streptococci, three cases; *B. coli*, three cases. One of the fatal cases was due to *B. coli*. In six other fatal cases no blood-stream invasion could be detected. With regard to the treatment of blood-stream infections, antisepsics of many kinds had been administered intravenously with varying results, but the best results were to be expected from antistreptococcal serum given in large doses and repeated. Vaccines were not of much use in the acute stages. Ligation of the infected veins should be reserved for chronic cases of pyaemia, with intermittent blood invasion, where the patient's resistance did not improve with more conservative methods of treatment.

Dr. W. A. DAFOR then gave an account of an epidemic of puerperal sepsis in Toronto due to *Streptococcus haemolyticus*, including eight fatal cases. At the same time there was a marked prevalence of sore throats, sinus infections, and middle-ear troubles throughout that city, and it was thought that these factors might be contributory. Septicaemic symptoms started between the second and fifth days with one or two rigors, after which a steady rise of temperature was maintained. The lochia were scanty, purulent, and somewhat fetid in all cases: the patients died within six days of the onset of the symptoms. *Streptococcus haemolyticus* was found in the noses or throats of both house-surgeons, 15 to 20 per cent. of nurses, and 35 per cent. of the students. Stringent precautions were taken, and carriers were not allowed to return to the hospital until two negative swabs had been obtained. The patients were first treated with a polyvalent antistreptococcal serum and quinine dihydrochloride intramuscularly, but in later cases phenol was administered intravenously. Phenol had been found by Dr. Maitland to increase the phagocytic power of the white blood corpuscles and the bactericidal power of the blood serum. The standard dose consisted of 0.75 c.cm. of 0.5 per cent. phenol. This was given intravenously once daily for three doses; a day was then missed; the treatment continued thus three to four times. Indirect immunotransfusion was also tried, with good results. Early immunization was advised for any patients exposed to infection. The maximum action of the drug occurred in half an hour and lasted for three hours after its administration. It was very gratifying to find that no further cases had developed after stringent preventive measures had been taken.

### ASTHMA.

At a meeting of the Glasgow Southern Medical Society held on March 18th, with Dr. JOHN GARDNER in the chair, Dr. JAMES ADAM opened a discussion on asthma.

From a study of 840 cases, Dr. Adam laid down the following propositions as to causation: (1) that asthma is a toxæmia; (2) that the toxæmia arises partly in the bowel, partly in the tissues, partly from the absorption of nitrogenous poison under putrefactive action, but mainly from an error in nitrogenous metabolism following imperfect oxidation or enzyme action; (3) that the metabolic error is closely connected with excess of carbohydrate in the
